Q. Then the conclusion is that in a great majority of cases, practically all, thus far there has not been any intelligent legislation?—A. I would say that—with all due respect, you understand. The point is right here. We say the legislators who have enacted these laws have done the best they knew how. I do not want to give them any other reputation than that. But if they did not know it all, they could not do any better. And the man who does not know what the cost of an article is can not fix a price on it based on cost and do it intelligently. He may guess at it, and in the general shake-up of things and the competition, one thing rubbing against another, you may get at what we call the substantial adjustment, but you have not got it done scientifically.

Q. Now have you any other matter to speak of, Mr. Foote?—A. That is all so far as the uniform accounting goes. It might interest you to know this, that within the last 2 or 3 years the movement in this direction is growing very rapidly, and that there are some 12 or 14 organizations, representing gas works, water-works, street railroads, and different organizations of municipal reformers of different kinds, that have put themselves on record in favor of initiating this kind

of a system, and they have to-day committees appointed studying the question; and there is a very great hope of its taking effect in practical legislation soon.

Q. You have the bills written out?—A. The bills are in this book.

Q. You will leave a copy of them with us?—A. Yes; and I hope to see those bills presented—if I could have my own way about it, I would have them presented in every legislature there is in session, put them on their passage, and see what comes of it. Some legislatures might adopt them. And I want to say one word in regard to my own position in reference to these bills. I want to be clearly understood on one point: If in my proposition there is anything that is not sound, if any gentleman will make an amendment, will suggest an amendment to any of my propositions that will make them sounder business propositions for the public, I should be very glad to accept the amendment and to acknowledge it. But if he can not do that, why then I would like to have him stand with me for their enactment as they are drawn. That is the logic of the situation.

(Testimony closed.)

WASHINGTON, D. C., January 4, 1901.

TESTIMONY OF PROF. FRANK PARSONS,

President National Public Ownership League.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. At that time Prof. Frank Parsons, 11 St. James Avenue, Back Bay post-office, Boston, Mass., appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Will you please give your name and post-office address?—A. Frank Parsons; 11 St. James Avenue, Back Bay post-office, Boston.

Q. Are you connected with Boston University?—A. Yes.

Q. In what capacity?—A. I give a course of lectures on insurance law.

Q. How long have you been a lecturer there?—A. Nine years.

Q. Have you given special study to the subject of railways, telegraphs, telephones, and public-service corporations generally?—A. Yes.

Q. The commission will be pleased to hear you upon those subjects, and will be glad to have you proceed in your own way.—A. Thank you. That is what I would like to do. I have blocked out a line of thought on those subjects that your letter invited me to speak about, and would like to follow that line in dealing with them. They have been in my mind and under my study more or less for 25 years, at first chiefly from the attitude of a civil engineer. I graduated from the civil engineering course of Cornell University in 1873, and my mind in those years was mainly occupied with mathematical and economic ideas. A little later I began to study law, and then the legal and political elements of the problem became the predominant ones, and later yet I got still more deeply interested in general social philosophy, ethics, and sociology, and the ethical and social aspects became predominant over the others. I would like to present my line of thought, if you are willing, under the title—

PRIVATE MONOPOLY IN TRANSPORTATION CONTRASTED WITH PUBLIC OWNERSHIP AND COOPERATIVE OPERATION.

The fundamental test of any institution, method, or service must be its effect upon the public good, its relation to morals, manhood, government, industry, civilization, and progress; and in applying this vital test the principal emphasis must be placed not upon the financial results, but upon the human results, not on money, but on manhood. Final values—real values—must be measured in terms of life and progress, not in terms of dollars and cents. Dollars and cents are important, of course, but life, liberty, justice, virtue, and intelligence are infinitely more important. Material wealth is an excellent thing, rightly obtained and properly used, but it is not an end in itself—it is only one of the raw materials of civilization. Justice, character, and human development, happy homes and noble lives, are the real ends for which railways and telegraphs and telephones and all other institutions, whether industrial, political, or social, exist, and only so far as they conduce to these ends is their existence justified. So that even when we are dealing with questions of material wealth it will not do to consider simply the amount; we must consider also the method of production, distribution, and expenditure, for material wealth, wrongly obtained through bad processes of production, or unjustly distributed, or corruptly or injuriously used, may be opposed to the public good, and so become illth instead of wealth. Wealth is simply that which produces what is well; illth is that which produces what is ill.

THE AIM—PRIVATE PROFIT OR PUBLIC SERVICE.

In applying these tests, or this compound test with particular emphasis, the first thing that I note is the *difference of aim* between the two systems that I have spoken of. Private monopoly aims at dividends for stockholders; public ownership, as a rule, aims at service for all. I mean that a normal public institution aims at the public good, while a normal private monopoly aims at private profit. It serves public interest also, but such service is incidental, and not the primary purpose. It serves the public interest so long as it runs along in the same direction and is linked with private profit, but when the public interest departs from or runs counter to the interests owning or controlling the systems, then the public interests have to take a back seat. And not merely is the aim of private monopoly material wealth, subordinating the higher elements of wealth and even disregarding them, but the aim is material wealth for the few, not for all; and still further, the aim is material wealth for the few now. A private monopoly ordinarily can not expend money and develop a great system of transportation, looking for its pay in the next decade, or through the collateral development of other industries and of the country as a whole, but it must have its profit now; the stockholders and bondholders want their dividends and interest, and they want them immediately.

Public ownership, on the other hand, under normal conditions can and does aim first at the public good, making profit and material wealth a subordinate, incidental matter. And so far as it deals with material wealth on the financial plane, public ownership aims at wealth for all and not for the few, and due regard is paid to the future and to the collateral development of other industries and of the country.

In regard to this difference of aim which appears to me to be the fundamental distinction between the two systems, public ownership and private monopoly, I would like to read a passage from a speech of Bismarck, and another from the argument of the Prussian Cabinet, at the time they were considering the change from private ownership to a complete system of public railways in Germany.

On April 26, 1876, in a speech in the Prussian Parliament advocating the consolidation of railways under Government control and ownership, Bismarck used the following words. He was comparing the railways in Germany, which were public property and operated by the States, with the systems that were still private. He said in regard to the State railways:

"They serve chiefly the public interests of traffic, of commerce, of the circulation and transport of commodities and passengers; besides, as a secondary consideration, they aid the public treasury."

Please notice how distinctly he places the money question second. First, he said, "They serve the public interests of traffic, of commerce, of circulation," and afterwards he notes as a subordinate matter, "as a *secondary* consideration, they aid the public treasury."

Then he continues: "*And in all events promote only public interests.* It is the misfortune of private railways that a privilege granted by the State, and a privilege that could not be made use of without the help of the State—we may say a monopoly granted by the Government—should be legally exploited in behalf of private interests and private pockets."

Bismarck, one of the greatest minds and one of the greatest statesmen that ever lived, has stated in this speech, as clearly as it would be possible to state it, the vital difference between the two systems.

Let me turn now to another great document, the argument of the Prussian Cabinet, which was sent by them to the Reichstag in 1879 along with the bill providing for the absorption of the private railways, the transfer of them to the State. The argument for nationalization of the railways is concentrated on two great points. First, the benefits, economies, etc., that would result from the consolidation of the system under a single general management, and, second, "direct attention by the Government to public interests, which do not permanently find sufficient furtherance and protection where the railroads are in the hands of private corporations whose object is gain." There again we see that fundamental distinction clearly drawn and emphasized as one of the two vital reasons for the transfer of the railways.

The Federal Council of Switzerland in 1897 put out an argument to the people when the proposed taking over of the railroads of Switzerland to the State was being considered, and in that argument one of their main points was this same matter—that the transfer of the railroads to the State meant that they would be administered primarily for the public interest and not for the mere financial benefit of a small class of owners; that a public system would aim at advantage to the whole people, while private companies look mainly to the advantage of the stockholders or a small part of the people, and that a public system aims not only

at the benefit of the whole people instead of a part, but at the benefit of the people in the higher sense as well as in the commercial sense—the public good—not merely on the financial plane, but on political, social, and ethical planes also. I speak from memory about the Swiss arguments, giving the impression they made upon me. I haven't the documents with me. I have, however, a little quotation from a discussion of the vote of the people afterwards in Switzerland at the time when they overwhelmingly adopted the measure for making the railroads public. It is a summary made by Horace Micheli in Appleton's Popular Science Monthly for September, 1898, in which he says:

"The majority of the electors evidently regarded the railroads as a public service of the same kind as the post-office, telegraph, etc., and sought to remove all private influences and sense of personal benefit from their management."

The mere fact of changing the aim may not make the administration perfect, of course, but nevertheless, as these high authorities have recognized, it is of the greatest importance to change the aim. With equally good management and equally good intentions in those who have control, the aim makes all the difference in the world. If they aim at private profit, good management will get it; if they aim at public good and the higher wealth, good management will get that.

I have not by any means exhausted the evidence that public systems consciously aim at the public good and the higher wealth as superior to questions of mere financial gain. A few further items on this point may be useful here.

In Hungary in 1889 the Government changed from the old system of tariff to what is called the zono system, and they gave their reasons for the change in a document issued at the time.

Q. (By Mr. CLARKE.) When you say tariff there, you mean for transportation?—
A. Yes: the transportation rates. The Government gave their reasons for the change, and among all those reasons there is not one word about profit or financial gain in any way. The reasons are the facilitation of communication, the development of the country, the consolidation of the country politically by creating better communication among the people, breaking down prejudices and antagonisms by fuller intercourse, the development of civilization through the educational value of communication—"it was essential to consider the great economic and civilizing effects of such a reform," said the Government. Where is the private railway management that has reduced rates 40 per cent to 80 per cent for the sake of the civilizing effects of easy communication? To reduce rates and facilitate intercourse, and to do this by a system which, while *inducing a large increase of traffic*, would admit of *great simplicity* in its management, "so reducing the cost to the lowest practicable limit; the aim being to demand of the country the smallest financial sacrifices possible, and yet to inaugurate upon the Government railroads a radical reduction of rates" by "methods which would place the offered reductions within the reach of all, and adapt them to the requirements of all ranks and classes of the entire population," thereby securing "the great economic and civilizing effects" and other benefits above mentioned; such was the purpose of the Government railway management in Hungary. Social, political, and educational benefits supply the dominant motives; and so far was the State from subjection to the money motive that it was ready to make "financial sacrifices" in order to use the railroads for higher interests; seeking, however, with due regard to material economy, to make the financial sacrifices as small as possible. This noble railroad policy has been rewarded not only by large attainment of the benefits sought by the Government, but by such an astonishing growth of business and simplification of management that, instead of the financial sacrifices expected by the Government, the *net receipts were enlarged* by the change.

Again, in New South Wales, where the railroads are also public property, the head of the railroad commission says: "We do not run the roads to make money, but for the convenience of the public and the good of man." It is the human element they are considering, and not the financial.

So in New Zealand, probably the strongest illustration of all, Premier Seddon, and Minister of Railways Cadman, and his successor, Ward, have all definitely announced it as their settled policy, the settled policy of the State, to run the railroads in the interests of the public, to develop the country, to help labor, to encourage education, entirely subordinating questions of financial gain, and, in so far as they do consider material wealth, they consider it chiefly in the way of collateral benefits through the development of farms and factories and the growth of business throughout the country. They understand that every dollar spent in wise railroad construction means \$5 at least added to the value of land, and they take care that the State shall receive that value by keeping the land in the government's control as far as possible. They know also that the development of the railway system means the development of commerce and industry, and that the

indirect results even to the public treasury, without considering the higher benefits, will be ample remuneration for all they spend on the railroad system.

The same thing is recognized by the English telegraph. In one of our consular reports (United States Consular Reports, vol. 47, pp. 565, 566) I find the following statement: "The English Government does not consider the telegraph service as a means of revenue for the treasury, but as a means of information for the whole country, giving facilities of all kinds for its use and extension in all the social classes. In favoring increased trade by this instrument of commerce it well knows that the treasury will benefit indirectly from augmentation of the general wealth."

These illustrations could be extended, but the point is sufficiently emphatic now, perhaps, to offer and invite fair recognition, so I will pass to the consideration of the question.

HOW THE DIFFERENCE OF AIM WORKS OUT IN ACTUAL PRACTICE.

Discriminations.

From the theory to the fact, and first in regard to discriminations. Discriminations, usually more or less secret, between one person and another are perhaps the greatest evils of our railroad system. The Senate committee of 1885 found enormous evils in our railroad system in this regard, and stated the facts in emphatic terms in its report. On page 7 of their report they say that our efficient service and low rates—i. e., the low average of our freight rates—"have been attained at the cost of the most unwarranted discriminations, and its effect has been to build up the strong at the expense of the weak, to give the large dealer an advantage over the small trader, to make capital count for more than individual credit and enterprise, to concentrate business at great commercial centers, to necessitate combinations and aggregations of capital, to foster monopoly, to encourage the growth and extend the influence of corporate power, and to throw the control of the commerce of the country more and more into the hands of the few."

On page 40 the committee say: "Railroad companies are not disposed to regard themselves 'as holding a public office and bound to the public,' as expressed in the ancient law. They do not deal with all citizens alike. They discriminate between persons and between places, and the States and Congress are consequently called on to in some way enforce the plain principles of the common law for the protection of the people against the unlawful conduct of common carriers in carrying on the commerce of the country."

On page 188 the following example is given:

"One reference to the testimony must suffice to illustrate the universality of individual favoritism, the reasons which influence the railroads in favoring one shipper to the ruin of another, and the injustice of the system. Mr. C. M. Wicker, of Chicago, a former railroad official of many years' experience, was asked if he knew anything of discrimination upon the part of transportation companies as between individuals or localities, and testified as follows:

"Mr. WICKER. Yes; I do. And this discrimination, by reason of rebates, is a part of the present railroad system. I do not believe the present railroad system could be conducted without it. Roads coming into this field to-day and undertaking to do business on a legitimate basis of billing the property at the agreed rates would simply result in getting no business in a short time.

"Senator HARRIS. Then, regardless of the popularly understood schedule rates, practically it is a matter of underbidding for business by way of rebates?

"Mr. WICKER. Yes, sir; worse than that. It is individual favoritism, the building up of one party to the detriment of the other. I will illustrate. I have been doing it myself for years, and had to do it.

"Senator HARRIS. Doing it for yourself in your position?

"Mr. WICKER. I am speaking now of when I was a railroad man. Here is quite a grain point in Iowa, where there are 5 or 6 elevators. As a railroad man I would try and hold all these dealers on a "level keel" and give them all the same tariff rate. But suppose there was a road 5 or 6 or 8 miles across the country, and these dealers should begin to drop in on me every day or two and tell me that that road across the country was reaching within a mile or two of our station and drawing to itself all the grain. You might say that it would be the just and right thing to do to give all the 5 or 6 dealers at this station a special rate to meet that competition through the country. But as a railroad man I can accomplish the purpose better by picking out one good, smart, live man, and, giving him a concession of 8 or 4 cents a hundred, let him go there and scoop the business. I would get the tonnage, and that is what I want. But if I give it to the 5, it is known in a very short time.

* * * * *

"When you take in these people at the station on a private rebate you might as well make it public and lose what you intend to accomplish. You can take hold of one man and build him up at the expense of the others, and the railroad will get the tonnage.

"Senator HARRIS. The effect is to build the one man up and destroy the others?

"Mr. WICKER. Yes, sir; but it accomplishes the purposes of the road better than to build up the 6.

"Senator HARRIS. And the road, in seeking its own preservation, has resorted to that method of concentrating the business into the hands of one or a few, to the destruction of the many?

"Mr. WICKER. Yes, sir; and that is a part and parcel of the system."

On page 189 the committee says:

"The practice prevails so generally that it has come to be understood among business men that the published tariffs are made for the smaller shippers, and those unsophisticated enough to pay the established rates; that those who can control the largest amounts of business will be allowed the lowest rates; that those who, even without this advantage, can get on 'the inside' through the friendship of the officials or by any other means can at least secure valuable concessions; and that the most advantageous rates are to be obtained only through personal influence or favoritism, or by persistent 'bulldozing.'

"It is in evidence that this state of affairs is far from satisfactory, even to those specially favored, who can never be certain that their competitors do not, or at any time may not, receive even better terms than themselves. Not a few large shippers who admitted that they were receiving favorable concessions testified that they would gladly surrender the special advantages they enjoyed if only the rates could be made public and alike to all."

Again, on page 191:

"Universal complaint has been made to the committee as to the discriminations commonly practiced against places, and as to the conspicuous discrepancies between what are usually termed 'local' rates and what are known as 'through' rates."

In summing up the testimony on pages 180-182 of their report, the committee presents this tremendous indictment:

"The complaints against the railroad systems of the United States expressed to the committee are based upon the following charges:

"1. That local rates are unreasonably high, compared with through rates.

"2. That both local and through rates are unreasonably high at noncompeting points, either from absence of competition or in consequence of pooling agreements that restrict its operation.

"3. That rates are established without apparent regard to the actual cost of the service performed, and are based largely on what the traffic will bear.

"4. That unjustifiable discriminations are constantly made between individuals in the rates charged for like service under similar circumstances.

"5. That improper discriminations are made between articles of freight and branches of business of a like character, and between different quantities of the same class of freight.

"6. That unreasonable discriminations are made between localities similarly situated.

"7. That the effect of the prevailing policy of railroad management is, by an elaborate system of secret special rates, rebates, drawbacks, and concessions, to foster monopoly, to enrich favored shippers, and to prevent free competition in many lines of trade in which the item of transportation is an important factor.

"8. That such favoritism and secrecy introduce an element of uncertainty into legitimate business that greatly retards the development of our industries and commerce.

"9. That the secret cutting of rates and the sudden fluctuations that constantly take place are demoralizing to all business except that of a purely speculative character, and frequently occasion great injustice and heavy losses.

"14. That the differences in the classifications in use in various parts of the country, and sometimes for shipments over the same roads in different directions, are a fruitful source of misunderstandings, and are often made a means of extortion.

"15. That a privileged class is created by the granting of passes, and that the cost of the passenger service is largely increased by the extent of this abuse.

"16. That the capitalization and bonded indebtedness of the roads largely exceed the actual cost of their construction or their present value, and that unreasonable rates are charged in the effort to pay dividends on watered stock, and interest on bonds improperly issued.

"18. That the management of the railroad business is extravagant and wasteful, and that a needless tax is imposed upon the shipping and traveling public by the unnecessary expenditure of large sums in the maintenance of a costly force of agents engaged in a reckless strife for competitive business."

The interstate-commerce law was passed and the Interstate Commerce Commission was established to abolish the evils of unjust discrimination, but the work has not been accomplished. The Interstate Commerce Commission has told us year after year that the discriminations are still going on; that they can not be stopped, under present laws at least; and I think we might say that no law that could be passed of a regulative character could possibly put an end to these preferences given to the favorites of railroad management and to great shippers. These discriminations result from a law higher, I believe, than any that Congress can make—the law of industrial gravitation toward the center of highest profit. There is more profit to the railroad management in dealing with one man than in dealing with many. It is a simpler matter and safer; they can control things better; they can ship in larger quantities; in every way it is better for the railways. It is also better for the railroad manager in another sense, for he frequently has some stock or interest in the company or firm which is given the privilege, and so he secures a personal profit; not always, but many times. So that, considering all the influence tending in that direction, especially the pressure brought to bear by great companies and firms through the threat to withdraw their traffic entirely unless the rates they demand are given them, we can understand that our railways are practically compelled, under existing conditions, to give preferences to the great trusts and corporations; and they will do it secretly if they are not allowed to do it openly.

The Interstate Commerce Commission states in their report of 1890, and reiterates in the report of 1900, that—

"Tariffs are disregarded, discriminations constantly occur, the price at which transportation can be obtained is fluctuating and uncertain, railroad managers are distrustful of each other, and shippers all the while in doubt as to the rates secured by their competitors. * * * Enormous sums are spent in purchasing business, and secret rates are accorded far below the standard of published charges. The general public gets little benefit from these reductions, for concessions are mainly confined to the heavier shippers. All this augments the advantages of large capital, and tends to the injury and often to the ruin of small dealers. These are not only matters of gravest consequence to the business welfare of the country, but they concern in no less degree the higher interests of public morality. * * * It is often said, in substance, that if any carrier gives discriminating or preferential rates it is the duty of the commission to prevent or punish such misconduct. Unfortunately, the commission is powerless to perform any such duty."

The commission then states that even criminal prosecutions have failed to secure the enforcement of the law. And in regard to the regulation of charges, it says:

"Any railroad company can charge for its services whatever it pleases, and as much as it pleases, without any real power in this commission or any other tribunal or court to limit the amount of such charge."

Interstate Commerce Commissioner Prouty, in a paper on Railway Discriminations, published by the American Academy of Political and Social Science, makes the following statements:

"It is well known that for years past a large portion of the competitive railway traffic of this country, especially those articles which are moved in large quantities, and in the handling of which a small amount in the freight rate is of great consequence, have not been moved upon the published rate. It is an equally well-known fact that during the same time the tendency has been to center the handling of these articles in the hands of comparatively few persons. The United States exports annually enormous quantities of grain, but you can count upon your fingers the concerns which bring the bulk of it to the American seaboard. We are told that grain upon the Chicago market is handled by a half dozen concerns. It is brought from the fields west of Chicago into that city by as few. One company buys upon one line of railway and nobody else can buy there; another upon another line. Exactly the same thing is true of beef, pork, lard, provisions, and almost all those commodities which are the necessities of life.

"Is there any connection between these facts? Is the discrimination in the freight rate responsible for the concentration of business in the hands of the few? There can not be the slightest doubt of it. No person at all familiar with the situation has any other opinion. Freight-rate discriminations are the most potent factor in the establishment and continuance of great combinations of capital at the present time. It may be doubted if a single one of those monopolies which

have fastened themselves upon the country in recent years could have done so in the face of absolute equality in the freight rate."

In granting preferences and making discriminations "many devices have been adopted. These sometimes take the form of an elevator commission; sometimes an excessive car mileage; sometimes the shipper pays the full interstate rate, in consideration that he shall receive preferential rates within the State, to which the interstate-commerce act does not apply."

How completely the law has failed to stop discrimination is further illustrated by a statement on the subject by the president of a large system, quoted approvingly by Mr. A. B. Stickney, himself a prominent railroad president, in his book on the Railway Problem, page 307: "If all who have offended against the law were convicted, there would not be jails enough in the United States to hold them."

One of the great points made by Bismarck and the Prussian cabinet was that Government ownership would get rid of these discriminations, and the Germans had suffered from them severely; not quite so much as we have, perhaps, but very greatly. They spoke of it in their argument several times, and emphasized it as the greatest and most objectionable feature of the private railway system—the abuse of the powers of the managers in giving preferences to favorites or large concerns. The German Government, with all its imperial power, had tried year after year to stop these discriminations, and in the argument of the cabinet they said that it had proved totally impossible to prevent them, and that this impossibility made it also impossible for the Government to control or regulate the system of transportation.

There is no necessity for me to go into details or give illustrations of discrimination. The commission has had plenty of them, I presume.

Q. (By Mr. PHILLIPS.) Have you anything of late in regard to discrimination?—A. The latest I have is the Boston and Albany investigation. Has that been presented to the commission?

Mr. PHILLIPS. No; I think not.

The WITNESS. While the leasing of the Boston and Albany to the New York Central was under consideration the road was investigated pretty thoroughly, and one of the things brought out was that the published rates were not followed to any large extent. Various shippers, merchants, manufacturers, etc., were visited, and it was found that the local rates were not followed; that shippers were receiving widely varying discounts from the published rates, and that shippers did not know at all what rates their competitors and neighbors were getting. They were not satisfied with the system, but they were afraid to complain; that is, if they made complaint they would lose whatever advantages they possessed and become marked men for railway persecution. The railroad commission of Massachusetts advertised for shippers who were not satisfied to come and make complaint; but they did not do so, for the reason that any shipper who complained of a railroad would be apt to fare a good deal worse afterwards than before; his goods would be delayed, his facilities would be cut off, and whatever reductions he was getting would be stopped, and he would have to pay the full published rates; he might also be involved in costly litigation, and he did not dare to say anything.

The railroad commission was asked by the legislature about these discriminations on the Boston and Albany, and a report was handed in by the commission last year (1900), saying that the reductions from the published rates averaged 40 per cent, and that in different cases they ran from 10 to about 73 per cent—fully confirming what the shippers had said. It was admitted, however, that this report was not written by the railroad commission. They had passed the question over to the Boston and Albany, and a high official of the road had written the reply. The railroad commission admitted that they did not know anything about it. They, however, handed in the report of the railroad official as being true, and it was admitted, both by the railroad and by the commission, that these discounts on local rates were being given, and they are being given now. The railroad official claimed that the special rates were "open to all shippers sending freight under similar circumstances and conditions," which may be true if we understand "circumstances and conditions" to include the relations of the shipper to the managers, and his pull with the railroad, but can not in any other way be made to square with the statements of shippers and the other evidences in the case.

The effects of railway favoritism are well illustrated in the case of oil. The Standard Oil trust was formed on railway discrimination, and though strong enough now to defy the railways, the union between the railways and the combine still continues to bear rich fruit. For example, it is well known that at the

present time the rates on oil are such as practically to shut out West and wasteful, and everybody but the Standard Oil Company, almost, from New England public by the think that testimony has been given to you, though, so it is not necessary force of

Q. Not very specifically. Have you direct testimony on that, taken year, that shows that to be the fact?—A. I got my information from Commissioner Prouty's statement of the facts, shown by the records of the Interstate Commerce Commission. It appeared in testimony before the Interstate Commerce Commission in 1898 that the Standard Oil is helped by the railroads of New England in two ways. In the first place, their tank cars, which usually weigh from 35,000 to 50,000 pounds, are ordinarily billed at 24,000, according to the testimony of the agent of the Boston and Albany Railway in East Boston, the great center of the Standard Oil business in New England. Out of 14 cars sent over another road from East Boston to Newport, R. I., at least half were billed and paid for on the basis of 24,000 pounds to the car, although their average weight was shown to be 48,550 pounds per car. It was claimed that these underbillings were clerical errors. In considering the motives and reliability of such a claim we must not forget the curious habit shown by these clerical errors of piling up in great bunches in the Standard Oil business, and the still more curious fact that all the errors are in favor of the trust—none against it.

Again, the practice of adding the Boston rate to the local rate on shipments of oil into New England puts the independent refiners at a great disadvantage. The rate on corn from Cleveland to Boston is 15 cents per hundred pounds, and to New Haven the same, but the rate on petroleum from Cleveland to Boston is 24 cents, and to New Haven it is the Boston rate, 24 cents, plus the local rate, or a total of 38 cents from Cleveland to New Haven. Now the Standard Oil has got large warehouses in East Boston, and they bring their oil by boat and store it there, and then they get the freight rates simply from Boston down to the Connecticut point, whereas the Western refiner who has no storehouse has to pay first the Boston rate and then this local rate also to the other point, even though the oil may go direct, so that the rates are practically prohibitive, almost prohibitive to the Western refiners, the Cleveland men.

The same thing in another form exists as between Chicago, or the refinery of the Standard Oil at Whiting, near Chicago, and the Cleveland men. The rate on oil from Chicago and Whiting to New Orleans is made 25 per cent lower than it is from Cleveland to New Orleans, so that the independent refiners are practically shut out from the southern territory. Illustrations might be multiplied to any extent, and I can put more in evidence if the commission desires.

Q. Have you the written testimony to which you have alluded?—A. Yes.

Q. Could you furnish a copy to the commission?—A. The testimony before the Interstate Commerce Commission, and Commissioner Prouty's statements are available. On the Boston and Albany matter, my information comes from direct knowledge of the investigations and from the report that was handed in from the railway commission to the legislature. That would give you one of the main points or several of them. I can send you a copy of that.¹

¹At a subsequent date Mr. Parsons submitted a copy of the report above referred to. So much of it as relates to freight discrimination is given below.

[House, No. 1090.]

COMMONWEALTH OF MASSACHUSETTS,
BOARD OF RAILROAD COMMISSIONERS,
No. 20 Beacon Street, Boston, March 14, 1900.

HON. JAMES J. MYERS, *Speaker House of Representatives.*

DEAR SIR: By direction of the board of railroad commissioners I have the honor to send you herewith the report of the board transmitting the information obtained in reply to the questions contained in the orders of the House of Representatives dated, respectively, February 13, 1900, and February 15, 1900.

Yours, truly,

WM. J. MCCULLOUGH, *Assistant Clerk.*

COMMONWEALTH OF MASSACHUSETTS.

To the Honorable the House of Representatives:

The board of railroad commissioners respectfully transmits the information obtained in reply to the questions contained in the orders of the House of Representatives dated, respectively, February 13, 1900, and February 15, 1900.

INFORMATION RELATING TO QUESTIONS CONTAINED IN ORDER OF FEBRUARY 13, 1900.

* * * * *

Question 3. Do shippers of large quantities of freight by the Boston and Albany Railroad receive lower rates than the published tariff rates?

Answer. What is known as the published tariff of freight rates upon the Boston and Albany Railroad was issued in 1881, and has never been revised since that time. Rates lower than published tariff

have hastened to the face of a [redacted] (AR.) You state that that report was made by an officer of

In granting [redacted] any that was handed in through the commission?—A. Yes; I adopted. [redacted] commission admitted that it was made by an officer—they did not

an excess [redacted] there was a difference of from 10 to 73 per cent. Is that discrimination in the class of goods or over the whole tariff?—A. All over the tariff—on the [redacted] of goods.

But suppose you take one classification—the second class. Did you find a difference of 10 to 73 per cent between shippers in that class, or was that 10 to 73 per cent scattered over the whole classification?—A. Scattered over the whole classification.

Q. Did you prove any discriminations as between the same class of shippers for the same goods?—A. Yes; some shippers pay nearly or quite the published rates,

rates are charged on nearly all articles of freight moved in large quantities, owing, it is explained, to changed conditions of business, competition, and the establishment of new industries.

Question 4. If so, is there any standard schedule of discount by said railroad in proportion to the amount of shipments or do individual shippers get such discounts as they can?

Answer. There is no standard schedule of discount proportionate to the amount of shipments. It is the practice to make special rates varying according to the nature of a commodity and the distance it is carried. These commodity rates are open to all shippers sending freight under similar circumstances and conditions. Special rates are also made for the benefit of persons who carry on a business that calls for the transportation of a variety of goods and commodities. This rate is made applicable to all goods shipped by such persons, regardless of particular commodity or tariff rate. The benefit of a rate so established for any one person is given to any other person carrying on a similar business.

Question 5. What is the largest discount, if any, below the published tariff rates given by said railroad to any shipper, and what is the average discount and how is this average computed?

Answer. The largest discount below published tariff rates is made for the shipment of the product of a trap rock quarry at Westfield. This is carried from Westfield to Brighton at 65 cents per ton of 2,000 pounds, while the tariff rate is \$2.40 per ton. Discounts vary from this one of 72.9 per cent, which is an extreme case, to that of 10 per cent, according to conditions. As an example of discounts made from the published tariff rates, the following figures may be taken, applicable to shipments from Boston to Springfield:

	First class.	Second class.	Third class.	Fourth class.
Discount.....	Per cent. 15	Per cent. 24	Per cent. 24	Per cent. 33½

The average rate of discount from the published tariff upon local freight carried on February 28, 1900, shows a discount of 40 per cent. This particular day was taken at random and gives a fair average of discounts generally made.

This percentage is arrived at by carrying out at the regular published tariff rates all local freight on that day carried at less than published tariff, the difference between the amount thus obtained and the amount actually charged, showing the discount to be 40 per cent of the regular published charges.

The above statements apply to freight which originates at and is shipped to a station on the line of the Boston and Albany Railroad.

The through rates for freight business done in connection with other railroads are subject to agreement between the interested roads, and upon this class of business the proportionate rate received by the Boston and Albany Railroad as a rule is less than local rates. So far as these through rates relate to interstate business, they are necessarily subject to frequent changes.

* * * * *

INFORMATION RELATING TO QUESTIONS CONTAINED IN ORDER OF FEBRUARY 15, 1900.

* * * * *

Question 2. Does a person in the habit of making large shipments of freight on said railroad have the benefit of a lower rate for one shipment of certain freight than the rate required of a person not in the habit of making large shipments for one shipment of similar freight?

Answer. All shippers receive the same benefits where a tariff has been established on certain articles as commodities. Where a tariff has been established for a particular business, based upon the conditions attaching to that business, all persons engaged in such business are given the advantage of this tariff. We are informed, in other words, that whether under the public tariff rates or special rates, no distinction is made between shippers, based upon the quantity of shipments, except that made between the shipment of carload quantities and those less than a carload, the unit of freight shipment being a carload.

The period of time to which statements in this communication are applicable, where not specially mentioned, is the period ending September 30, 1899, that being the period adopted in one of the questions submitted, and one which would seem to answer the purposes of the inquiry.

An opportunity was given to any person having within his knowledge facts or information relating to differences in freight rates to present them at a public hearing. Although notice of this hearing was widely given by publication in the principal cities along the line of the Boston and Albany Railroad, no one appeared at the appointed time.

JAMES F. JACKSON,
GEORGE W. BISHOP,
HERSEY B. GOODWIN,
Commissioners.

MARCH 14, 1900.

while others, dealing with the same class of goods, obtain concessions running anywhere from 10 to 70 or more per cent.

Q. (By Mr. PHILLIPS.) That was generally in favor of the large shipper as against the smaller one, was it?—A. Yes; that is my impression. And the railway officer said that "rates lower than published tariff rates are charged on nearly all articles moved in large quantities." In answer to a question "Is there any standard schedule of discount in proportion to the amount of shipments, or do individual shippers get such discounts as they can?" the Boston and Albany official said: "There is no standard schedule of discount proportionate to the amount of shipments." He also stated, as already noted, that while these secret discounts were made, the same discounts were always made under the same circumstances; but our investigations lead us to feel quite positive that he was punning. He used the words "under the same circumstances" and so framed a true statement if you make the meaning of "same circumstances" broad enough—the same circumstances in relation to the management of the railways, the same pull, the same desire to favor this man as to favor the other, or this one as large a shipper as the other, and so on.

Q. (By Mr. CLARKE.) It was your opinion, then, that the attorney was not quite frank about that, and that he used the word "circumstances" in too broad a sense?—A. In a very broad sense.

Q. A sense broader than the mere surroundings of the freight problem itself?—A. I think so. He did not swear to the statement, nor even sign it. But if the words "fair and lawful" or the phrase "properly essential circumstances" had been added, and he had been asked to subscribe and swear to the document, I doubt if he would have done so, although it is possible, of course, that he would have thought even the most subtle difference of relationship of the shipper to the manager or the railway was one of the fair and essential circumstances, and it is also possible that even a high railway official might be willing to tell what he knew to be untrue, although I believe most railway men are honorable men according to present business standards, and prefer to make their statements in such form that they are capable of a truthful interpretation if the reader has wit enough to read the true interpretation.

Q. Was that official Mr. Samuel Hoar?—A. We were not informed what official of the road was responsible.

Q. (By Mr. LITCHMAN.) Is it your opinion that these discriminations were sufficient to create a monopoly in favor of any individual shipper?—A. According to my understanding of monopoly, yes. I understand monopoly to be any advantage which tends to shut out competition, and therefore any discrimination in freight rates would be a monopoly more or less complete according to the degree of discrimination. For example, the difference brought out in the Hepburn report, between A. T. Stewart and other shippers of dry goods—he was given a rate of 13 cents a hundred and everybody else had to pay 20 cents. That was sufficient of itself to give A. T. Stewart an enormous margin of profit and a great power to control the market; and while others were able to do some business, I believe in a very true sense A. T. Stewart had a monopoly.

Q. Did your investigation go far enough to locate the kinds of goods outside of oil which you referred to?—A. Many kinds. The majority of merchants interviewed were found to have discounts, more or less.

Q. Covering substantially all branches of industries?—A. A good many of them.

Q. Of the leading branches?—A. Of the leading branches.

Q. (By Mr. FARQUHAR.) Did the Boston and Albany have a competing line?—A. The Boston and Albany is competing to some extent with the Fitchburg, and to some extent, I suppose, with the New Haven road.

Q. Well, these discriminations you speak of are on local deliveries of the road?—A. Local rates.

Q. Entirely local to the Boston and Albany itself?—A. Yes; the investigation I have been speaking of related to local rates.

Q. So you believe it is a matter of personal favoritism, then, the advantage of the rates given?—A. Not wholly personal favoritism. I think the railway managers are driven to these discriminations largely. I think they are of two classes. Some rates are made and advantages given through favoritism. Sometimes the purpose is to let the favored person realize a large profit. Sometimes the managers share in the profit themselves, as was originally the case in the building of the Standard Oil trust; it was built up by letting railroad managers in on the ground floor to share in the profits. But the other and by far the largest class, I believe, consists of discriminations that are practically forced upon the railroads by the threats of large shippers to transfer their traffic.

Q. Do you think they could advantageously transfer their traffic from the Boston and Albany to any other road in Massachusetts?—A. I think that they would transfer their traffic, perhaps, if they did not get what they wanted, even if it was not advantageous for a time. I am not sure about that. That is only impression as to the cause. I am inclined to be very charitable in my feelings toward railway managers. I think they are under tremendous pressure.

Q. (By Mr. LITCHMAN.) Could not that pressure be relieved by legislation?—A. Relieved a little, perhaps, but not overcome. If the enormous power of the German Government could not do it, I do not see how we could do it, especially as the railway managers can give preferences, not merely through rates, but through car service, through their car mileage allowance, through elevator commissions and subsidies of various kinds, and if they were driven to it, they could give the preference by private arrangement, the same way that men meet legislators, and pass money without any record of it at all. I do not see how in the world it can possibly be wiped out by legislation so long as the roads are in private hands. I believe the only way it can be prevented is to do away with the cause of it, which is the antagonism of interest between the owners and managers of the railways on the one hand and the public on the other, and the only way to remove that antagonism of interest, so that the public interest shall be the interest of the owners, is to make the owners and the public identical.

Q. (By Mr. FARQUHAR.) I would like to ask another question on this Boston and Albany matter. Did you, in your investigation, find there had been discrimination made on the Boston and Albany to build up manufactories on their own line? Did any manufacturers get special rates there to build upon the Boston and Albany line?—A. I think to a certain extent that is true. I think that is one of the causes; yes.

Q. (By Mr. CLARKE.) How did you obtain the evidence of discriminations by the Boston and Albany? Did you and your associates go around and interview the merchants?—A. Personal interviews with the merchants were one source of information.

Q. Nobody representing the Boston and Albany was present at the interviews?—A. No.

Q. It was entirely ex parte, then?—A. Yes.

Q. And witnesses were not under oath?—A. No.

Q. You have every reason to believe they told the truth?—A. Yes, I think so; especially as the account given in by the official of the Boston and Albany agreed with the generalizations derived from facts from the merchants and other sources.

Q. (By Mr. LITCHMAN.) Did you make an investigation as to any other road than the Boston and Albany?—A. No.

Q. Have you any knowledge as to whether it would apply to the other roads?—A. No personal knowledge; no. Mr. Cowles, of Connecticut, has investigated the New Haven and Hartford, and has found even worse discriminations down there than have been found in Massachusetts.

Q. (By Mr. PHILLIPS.) At whose instance was this investigation made?—A. Well, there were a number interested in it. Mr. W. J. Abbot was one of the first; Mr. McNary, of the Massachusetts legislature, took a leading part; Professor Bemis and Professor Commons, of New York, rendered excellent service; Hon. George Fred Williams, of Boston, took a strong interest in the movement, and a number of others who thought it was a shame to have the Boston and Albany leased to the New York Central.

The other phase of discrimination I would like to speak of a moment was brought out very prominently in our studies in New England, and the best source of information, perhaps, is the report made by the Massachusetts Railroad Commission a few years ago (1894), in which they compared the average freight rate on New England roads, individual roads—and the average of all roads there—showing that our rates were about double the average freight rate in the Middle States, or in the Middle West, and that it was nearly double what the average freight rate was for the whole United States, and they argued with much force that it was really a discrimination against New England as a whole, especially against Boston. Now, one of the pleas put forward in this Boston and Albany matter was that the giving over of the Boston and Albany to the New York Central control would intensify instead of relieve that sectional discrimination against New England as a whole, because the road would come under the control of those interested chiefly in the development of New York City, and not in the development of Boston and the New England States. This phase of discrimination also is much diminished under public ownership. I ought to have said, before leaving that other phase of secret discriminations, that since Germany has taken her roads under public control personal discrimination has been completely wiped out, according to all the

testimony I have been able to get, and also in New Zealand and Australia, where the roads are public, there is absolutely no question that personal discriminations against small shippers in favor of big shippers or favorites of railways do not exist at all. I think there has not been even a suspicion on the part of the most bitter opponent of the public system in any of those countries to that effect. Professor Bemis has even gone so far as to state that in no one of the 30 countries owning and operating their railroads has any opponent of public ownership ever made a complaint in regard to personal discriminations. That is a pretty strong statement. I can't make as strong a statement as that, but I can say that so far as my information extends it is true that no complaint of any grievance or personal discrimination of this kind has been made in any of those countries.

Q. (By Mr. LITCHMAN.) In that connection you speak of 30 countries controlling their railroads—by government control I take it you mean?—A. Yes.

Q. Can you tell the mileage covered by that control?—A. I have not got it in my mind.

Q. Could you get it and supply it in your testimony?—A. Yes.

Q. I wish you would do so.—A. I will do that.¹

Now, I would like to leave the subject of discrimination, interesting as it is, and pass to the topic of rate making in general.

Q. (By Mr. KENNEDY.) Before you do that I think I would like to ask you this question right here: Do you believe if we had Government ownership of railroads in this country there would be any danger of sectional discrimination taking place on account of parties—by parties in control of the Government?—A. I think that would be one of the difficulties to be guarded against, and I am going to deal with that question under this next topic.

RATE MAKING IN GENERAL.

I have divided it in this way because I wanted to consider the two phases, the dishonest or secret phase of rate making, and the open, above-board part of the business. I believe from my studies that the tendency of private monop-

¹ In compliance with the above request Mr. Parsons subsequently submitted the following table, stating that it was prepared by his secretary from the Statesman's Year Book for 1900.

a Ninety-two miles owned jointly by the Government and companies.

oly is exactly contrary to the tendency of public ownership in this matter of open rate making, as well as in the matter of secret rate making. A public plant tends in the long run to make lower rates than private monopolies make in the same country under the same conditions, and it tends to make a just, impartial tariff, intended to develop the country and not aimed principally at profit; whereas the private monopoly tends to make comparatively high rates and an unjust, partial, complex tariff—even the open rates constitute an irregular, unsymmetrical, inharmonious, ill-adjusted, complex system to develop profit, instead of a simple, symmetrical, harmonious, well-adjusted system to develop the country. Private monopoly will develop the country so far as that development can aid profit and no farther.

THE LARGE SHIPPER V. THE SMALL ONE.

To illustrate these propositions take first the matter of justice. It seems to me unjust to favor even by open rates the very large shipper as against the small man, not unjust on the economic ground of cost, just upon that ground; but unjust upon the higher ground that we should seek the development of the community and the diffusion of wealth, which is one of the greatest objects to which the statesman can devote himself. If we are to favor anyone, we should favor the small man who needs the favor, rather than the large shipper, who does not need it nearly so much as the small man. The truest policy is to equalize opportunities, give the small man just as good rates as the large man, and no better, as in the postal service. And that is the tendency under public ownership of railways. For example, in New Zealand 400 pounds is carried at the same rate as a ton or a carload or a train load, and one bale of wool goes at the same rate as 1,000. In Russia the Government goes even further and carries 100 pounds on the State roads at the same rate as a carload or a train load, and in Germany the same principle is applied for the definite and avowed purpose of giving the small man a reasonable chance and enabling him to get a foothold and develop his industry.

THE CITY V. THE COUNTRY.

In the second place, as between the city and the country, I believe that our railroads have been forced by competition to put the freight rates down to a very low figure between the big cities, while they have left the local rates very high, so that the country districts have not received their due share of the benefits of railway development; they have not obtained the proportionate facilitation of intercourse and power of development that they ought to have received through these great new means of transportation. The cities have been favored as against the country, the big shippers as against the small men, and sections which have the large cities and the main currents of traffic have been favored as against the sections that lie a little out of the central current, like New England.

Exactly the opposite plan, or diffusion of benefit instead of congestion of it, has been adopted in all the systems of public ownership that I have studied. They aim to reduce the local rates in a fair degree at the same time that they reduce the rates to the cities. They even make the effort to make local rates very low, especially low, in order that the men in the country may develop the country somewhat on equal terms with the men who live in the cities. Our cities are built to fight in and not to live in. The houses are built close together to save rent and time and transportation cost—stores, factories, warehouses, depots, and docks—everything pressed together in one giant mass, whereby in the fight for wealth the city has a great advantage over the country. It is this that makes our cities the battle grounds of industrial war, masses our people in narrow streets and unwholesome houses, and crushes the conquered into the slums. Now, the railroad system in the hands of men who aim at the public good would seek to break up the slums by making low passenger rates, so that workmen could live in the country; they would aim to make local rates low, so that industries could live in the country and compete with those in the cities, instead of making the whole industry of the country center in the cities. One of the greatest dangers in this country to-day is the rapid growth and immense massing of industrial power in the cities. True statesmanship, I believe, would use the railroad system to counteract that tendency and to diffuse benefit. But on the Boston and Albany and on the New York, New Haven and Hartford we find that, while through rates have fallen very much, the local rates are in many instances almost as high, and, in some cases, quite as high as they were in 1881. For example, dry goods and boots and shoes, representing two of New England's greatest industries, pay the same actual local rates on the Boston and Albany as in 1881. The same is true of flour, glassware, cement, etc. Coal, the greatest necessity of the manufacturing business of the State, pays the same carload rate as in 1881, while for less than carload lots the rate has been increased. Thus in respect to a number of things that are of vital importance to the industries of New England there has been absolutely no reduction of local rates since 1881. And the freight statistician of the Agricultural Department, in Bulletin 15, page 65, has shown that even since 1865, if you reduce the rates to the gold basis, as is only fair, there has been little or no reduction in local charges; the average fare on the Boston and Albany, for example, was precisely the same then that it was in 1898. So that while there has been a great reduction in the rates between competitive points, and a consequent great reduction in the average freight and passenger charges, the local rates have been kept up. On the New York, New Haven and Hartford it was found that rates have been advanced. Mr. Cowles has investigated that subject, and he finds that from Hartford to New York, from Boston to New York, and from intermediate points between those two, the rates are higher now than they were in 1850. (See *A General Freight and Passenger Post*: Putnam's Sons.) This is very different from the policy of the public systems, and it is a matter of astonishment to the railroad student when he sees to how great an extent this difference has gone. I will return to that in a moment. Before I take it up definitely on a diagram I want to speak of a point or two more.

PUBLIC RAILWAYS AIDING LABOR.

In New Zealand and Germany, which are among the principal examples of railroad management by the State, there is a definite use of the railroads not merely to develop the country but to aid labor. They make very low rates for laboring men in New Zealand; they carry them at actual cost or even a little below it in order that they may go where work may be had. In other words, the railroads are used at cost or less to redistribute the unemployed, and to settle them on the land. They also make rates to enable city workmen to live in the country instead of clustering in crowded tenements. They carry workmen at 50 cents

a week in and out of the big cities; and in Germany workmen are carried in and out of Berlin on the public railways at 17 cents a week, about 1 cent and a half a trip. The same tendency is manifest in Austria-Hungary and in Belgium, though I do not have the figures in mind.

Q. (By Mr. CLARKE.) Have they the zone system in Germany around Berlin?—
A. Yes; a workman or anyone else can live 5 or 10 miles out and buy a ticket for a year at \$4.50 to go in and out as many times a day as he chooses—10 miles for a cent, at a very low estimate, with a moderately possible average of 20 miles for a cent in and out of Berlin.

EDUCATIONAL SERVICE.

The public roads also aim to develop education. They make very cheap excursions for school children—4 miles for a cent they average in New Zealand, and the minister announces definitely in his report that although they are losing money on their school excursions, and those for the factory people who are also carried at very low rates, yet the educational value far outweighs the cost to the treasury. The State railways of New Zealand carry the school children of the primary grades to and from school free of charge, as do also the State roads of New South Wales, Queensland, and South Australia. Such are some of the ways in which the managements of public railways manifest their beneficent intent to aid labor and education.

FAVORING AGRICULTURE, ETC.

They also specially favor agriculture and other rural industries that form the basis of civilization, industries that under our system are anything but favored, I think. For example: There was a great snowstorm in New Zealand that killed the sheep on very many ranches and threatened the ranchmen with ruin, but the public railroad management put down the sheep rates so that the farmers and ranchmen were able to restock the sheep runs and save themselves and the industry. The State roads of New Zealand carry lime free and make very low rates on fertilizers, as they do also in Germany and Russia, with the avowed purpose of developing the agricultural interests of the country.

LOW RATES.

Turning now to the question of low rates, allow me to call attention to this table (No. I), containing the average ton-mile and passenger-mile rates, which I obtained last spring (1900) from the reports of the different countries, except in the case of Great Britain (see note beneath the table), whose average rates are estimated. The United States, Switzerland, France, and Great Britain have private roads; Germany, Austria-Hungary, and Belgium have public systems.

The table referred to follows:

TABLE I—Average ton-mile and passenger-mile rates.

[Germany, Austria-Hungary, and Belgium have State systems; the rest have private systems.]

	Rate per ton- mile.	Average haul per ton.	Rate per passen- ger-mile.	Average haul per passen- ger.
	<i>Cents.</i>	<i>Miles.</i>	<i>Cents.</i>	<i>Miles.</i>
United States	0.75	130	2	26
Germany	1.40	60	1.1	20
Austria-Hungary	1.44	57	1	23
Belgium	1.30	40	.88	12
Switzerland	2.80	35	1.55	12
France	1.48	88	1.21	20
Great Britain	a 2.10	a 2	10

a As the English companies do not report ton-mile or passenger-mile data, the British figures are not official, but are based on the estimates of the great English authority, Jeans, and the eminent American engineer, Dorsey, who gives 2.5 cents and 2.33 cents as the probable ton-mile and passenger-mile rates for the United Kingdom in 1887, which, with due allowance for sinking averages in later years, at the ratio indicated by the experience of other European countries, affords the figures in the table for 1898.

The average rate per ton-mile in the United States, you see, is much less than in any other country, public or private. That average rate is often adduced as proof positive that the private system in such a country as America produces very

low rates. It is proof that it produces a low average rate; but underneath that low average lie several facts that must be noted. In the first place, the average haul in the United States per ton is 130 miles, while the average haul in Belgium is 40 miles. Now if the terminal expenses at one end are taken at 20 cents (which is probably about what they are on an average), at the two ends they would be 40 cents. In Belgium if we divide that terminal charge by 40, we will have 1 cent a mile for terminal charges, leaving a third of a cent for the actual transportation charge per mile. Dividing the terminal charges by 130, for the United States, we will have about three-tenths of a cent, which leaves a little less than half a cent per ton-mile for transportation in this country, so that the actual average transportation charge in the United States is really not as low as in Belgium probably, if the terminal charges are allowed for.

On the other hand, we are not to forget that the wages in Belgium are much lower than they are here, less than half, and in Austria-Hungary they are only about one-third and in Germany only about a half what they are here. So that turns the scale again the other way. But, again, the number of employees in Belgium and Germany per ton and per mile is very much greater than here, which tends to push the actual cost the other way. In respect to the efficiency of labor, we have to agree that the argument is much in favor of the United States; which, however, proves nothing for or against either public or private ownership, because the efficiency of labor in European countries is inferior to ours in private business as well as public. For example, the average mason in Germany lays fewer bricks in a day and fewer bricks for a dollar than the average mason here.

Again, we must consider the influence of grades, capitalization, cost of fuel and iron, density of business, and many other elements, which together make up a problem too complex to justify any definite inference from average rates. Mr. Fink, who is one of the highest authorities in the country, in his report of the Louisville and Nashville road for 1875, proved that the average cost per ton-mile varied 700 per cent on the different branches of that system under the same management. The ton-mile cost on one line was 8 times as much as on another line of the same system. So that it is clear that when all the factors are taken into account we can not draw any definite conclusion as to economy or efficiency of management from a comparison of average freight rates.

Then, again, under this general average freight rate of ours lies a very low tariff between competitive points, with comparatively high rates between local points, and many personal and unjust discriminations, so that I believe it is not just to make any comparison one way or the other on the basis of the average freight rate.

I thought at first, and used to argue, that the general average of passenger rates in Europe under the State systems, in Germany, Austria-Hungary, and Belgium—an average of about a cent a mile, did prove something, as compared with the very much higher rates on all private roads, 2 cents in the United States nearly, and in Switzerland a cent and a half, or a little over, and in France 1.2 cents, and in Great Britain estimated to be 2 cents—I thought it did prove a good deal in favor of the State systems; but as I look more deeply into it I believe that we can not make any definite judgment from the average rates alone, because so many elements enter into them, elements which differ so greatly in different countries.

I do believe, however, that some conclusions may be reached by a thorough examination of the details, and that it is easy to draw a solid conclusion when we find a definite purpose back of the averages in these public systems to facilitate freight and passenger traffic by the reduction of rates; and I also believe it is fair to compare railways under public management with the same railways under private management. For example, when the roads were made public in Germany, rates were reduced very greatly. The same thing was true when the roads were made public in Austria-Hungary, or soon after the system was arranged under public control. They made a tremendous reduction of 40 to 80 per cent in the passenger rates. In New Zealand also they are continually reducing just as fast as they can. Whereas our roads reduce when they are forced to by competition, or when they are driven to it or persuaded to it by their tendency to make special rates to favored shippers. Where these forces do not operate, as in ordinary local rates, we find the rates kept up as high as they were 20 years ago, and in some cases 40 years or even 50 years ago, and sometimes we even find an increase in the local rates.

So we are not without means of information in respect to the tendency of the two systems as to rates, although I do not feel that we are able to draw reliable inferences from the broad averages. But if we could, if it were a valid argument to say that the low average freight rate in the United States under private ownership proves the case as against the higher average freight rate under the public

systems, then why is it not fair to say that the high rates in Great Britain and Switzerland and France under private ownership in their turn prove the case for public ownership? The argument works both ways on its face; but I believe when we get down to an analysis of the facts it does not work either way merely on the broad averages. You must get down to the details, or look at the intent and policy of the two systems, or compare them under similar conditions.

Q. (By Mr. FARQUHAR.) Before you go further, let us have your argument on the average freight haul per ton and the average passenger run, in the United States, for example, as compared with Great Britain. [Referring to Table I.] Do not talk in averages.—A. Great Britain has also private ownership, with rates much higher than in the United States.

Q. Take Germany, or any one that you want to.—A. If you divide the 2 cents by 26, and the 1.1 by 20, you will get about 8 here and 5.5 here [pointing to Table I].

Q. (By Mr. CLARKE.) That is, you get about 8 in the United States and about 5.5 in Germany?—A. Yes; and here [pointing to Austria-Hungary] you get 4 and a fraction.

Q. (By Mr. LITCHMAN.) Does not my question come in very pertinent there—the contrast between the mileage as between 1 country and another—the large number of unproductive miles over which a passenger has to be hauled in the United States as compared with the compactness of territory in Germany?—A. Exactly; that is one feature of the mileage rate. When you compare the haul and the rate, the result is still in favor of the public systems on the passenger question.

Q. (By Mr. FARQUHAR.) In your analysis of that table is it not a fact that the whole cost of the road is the one you must consider, without eliminating the cost of the terminals?—A. The cost of the terminals is not eliminated in the table; the average rates per ton-mile and passenger-mile include the terminal charges and all other expenses of the railways. It is certainly true that in a good and valid argument you must take into account not merely the terminals, but the haul and the grades and the cost of construction, etc., and the number of laborers and the requirements as to safety and every element of the railroad system. Now, I simply say that that makes such a complex problem that no man on top of the earth can cipher out from the averages that rates are higher in one country than another.

Q. (By Mr. LITCHMAN.) Have you gone into the question of the difference in labor?—A. I have to some extent—I have said that wages in Germany, for example, are about one-half of ours.

Q. (By Mr. FARQUHAR.) They have more servants in Europe?—A. Yes; certainly.

Q. Did you ever figure out the grade matter, to know what effect the difference of grade has on rates?—A. In Germany and here?

Q. Anywhere. In Germany—do you take out the grades there?—A. I have made estimates of the effect of grades in my engineering days. I am familiar with Wellington's Economic Theory of Railway Location, which I suppose is still the best book on railway economics, and that only confirms me in the opinion that the whole problem is too complex to draw from rate averages any definite and reliable inferences as to the nature or efficiency of the management. That is only one of many factors affecting the rates, and in any case of differing averages we can not tell how much of the difference is due to different methods of control except by calculating and subtracting the effects due to all the other causes in the case. That is a very difficult and practically hopeless problem except where the comparison lies between a road under private ownership and the same road subsequently under public control, or where two roads are substantially alike except in the matter of the management, if it were possible to find such a case.

Q. (By Mr. CLARKE.) Did not Mr. Fink's report shed light on that subject of grades?—A. Yes; differences of grade and differences in the density of traffic were among the elements that made the ton-mile cost vary eight fold on different lines in Fink's system, all under equally good management—700 per cent more in some cases than in others. In view of that fact, what use is it to try to draw inferences from the average rate? I think none. I simply introduce this table to bring out the facts, call attention to the unreliability of the usual inferences from them, and show that I do not, for one, attempt to draw any conclusions at all from a comparison of average rates.

Q. (By Mr. A. L. HARRIS.) Before we pass from Table I, I would like to ask one question. What is the difference in the quality of the service between the United States, with private ownership, and Germany, Austria-Hungary, and Belgium, with public ownership?—A. The service here is better. The service in Great Britain, however, is inferior in many respects to what it is in Germany or

Belgium; at least their own writers say so. The railway journals in England are full of complaints, and have been for several years. The fact is, however, that that difference is not probably due to the difference in management of the two systems, but to the differences in the countries. Private concerns over there are just as much inferior or more inferior to private concerns in this country. Take, for example, the street railways of Great Britain. The street-railway system of Glasgow is public, and it has been one of the most progressive and one of the best administered of all the tramway systems in Great Britain. Yet it is far inferior to our private systems; but the private systems in England are still more inferior to ours. When we eliminate the effect of nationality by comparing systems of transportation in the same country, the public systems prove to be the best.

Q. What is the service in New Zealand?—A. In New Zealand the service is not as good on the whole as it is either in the United States or Germany, which is attributed by Mr. Reeves, Mr. Lusk, Mr. Henry D. Lloyd, and other authorities to the newness of the country. The service is being rapidly improved, and Mr. Lloyd says we have nothing in this country equal to the "bird-cage" car of New Zealand.

Q. (By Mr. LITCHMAN.) Have you any means of giving us information on the longest passenger haul in Europe?—A. I have not the figures in mind.

Q. As compared with the haul, for instance, between New York and Chicago?—A. No.

Q. Is not that a factor in the cost?—A. Yes; they are all factors in the cost; every difference is a factor in the cost. Now, where is the brain that can sum up all these differences and reach an accurate result—tell us what is due to the difference in civilization level in two countries and to grades, fuel, length of haul, wages, efficiency of labor, capitalization, density of business, and all the economic elements of railway construction and operation, and what is due to the difference between public ownership and private ownership? My point is simply this: That the only fair comparison of average rate levels is between private ownership and public ownership in the same countries, and not between public ownership and private ownership in different countries;—so far as the average rates are concerned the fair inference seems to me to be this: That we can see the tendency and direction of motion produced by public ownership in various countries and in this country, and then we have a right to argue that the movement will be in the same direction and of the same kind under the laws of human nature, of psychology, and social movement, that the same sort of change will produce a movement of the same nature in the same direction, although, perhaps, of different degree; that if public ownership in Glasgow lowers the rates, as compared with private ownership in Glasgow, and raises wages and serves the public better, and puts the profits in the city treasury instead of in the pockets of a few managers and stockholders, then, although we start here at a point further up the hill and the rates will not go as low as in Glasgow, nevertheless they will be lower than they are now, and wages will be higher than they are now, and public ownership will produce a better service of public interests than private ownership does here, and the profits will go to the public treasury.

Q. (By Mr. FARQUHAR.) Are the rates lower in Glasgow than they are in Philadelphia or New York?—A. Yes; the average rate is under 2 cents.

Q. What is the rate per mile?—A. I have not been able to get the average rate per mile, either there or here.

Q. Are not the rates in Glasgow for the distance run?—A. Yes; they have such rates.

Q. Have you ever figured it up to see if that figured up more than the cost here?—A. As I said, I have been unable to get the average mile rates on either side of the water. The density of traffic is greater there. They have 12 passengers per car mile in Glasgow; in Boston, 7 per car mile; in New York, on Broadway, 12 per car mile, and in Chicago 5 or 6, and the railways carry the passengers farther in Boston and Chicago, as a rule, than they do in Glasgow for a single fare. There is no doubt about that, but how much farther I do not know. Fares are nearly threefold here, but wages are almost double. I do not think our systems could carry for the Glasgow fare; perhaps in the future they may, when the cities take the street railways and pay off the capitalization, but they can not do it now. Whatever may be the truth about our rates as compared with Glasgow's, I think it is fair to conclude that the same kind of effect would be produced by a change to public ownership here that was produced by a change to public ownership there.

Q. (By Mr. A. L. HARRIS.) Taking into consideration the superior service in this country, what have you to say in regard to the relative rates for transporta-

tion?—A. I simply say that it is one more factor in the complex mass of factors which it is perfectly impossible to cipher out. If you want to find out about that, get Mr. Fink's statement of the various items of cost on the various divisions, the average of the various divisions of his Louisville system in his 1875 report, and it will convince you beyond a doubt, I believe, that no man on the face of the earth can figure the thing out from a comparison of rates; it is too complex.

Q. Then we are somewhat in the dark, as I understand, and will be probably as to the better of the two systems?—A. I think not. As I said at the beginning, I think that financial matters, as a whole, are infinitely subordinate to the human elements. Intelligence, virtue, justice, good government, diffusion of wealth, and civilization must take precedence of profit; and if the aim of a system under public ownership is to develop the country, to develop education and aid labor, and make just and impartial rates instead of unjust and partial rates, and in every way forward all public interests and the higher wealth, while private monopoly aims primarily at profit, subordinating these higher interests, and even opposing good government and the public welfare, the question at once—

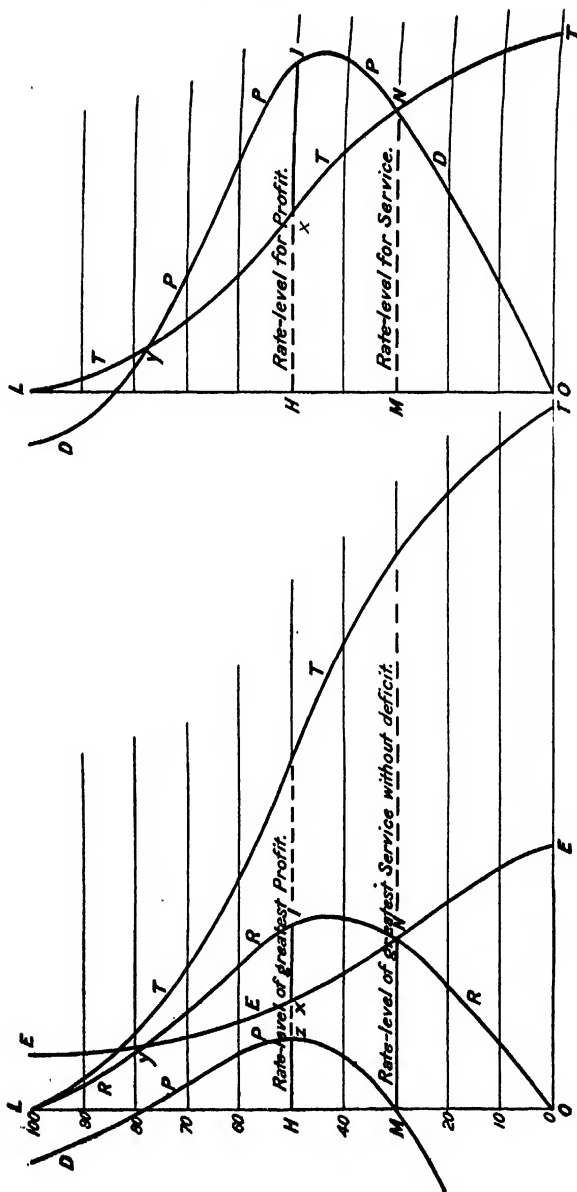

Q. (Interrupting.) I was asking my questions from a business standpoint.—A. Yes; but I can not admit that the business standpoint has any business to take rank with the other standpoint. It is important in its place, and I think we can reach some clear results even from the business standpoint, but even if we could not do this, there would still be considerations of vastly greater moment than any question of money. While we may not be able to solve the problem from the business standpoint as between two different countries, we can solve it by studying cases where both systems have been tried in the same country. In Austria and Germany and New Zealand they tried both systems. Germany tried private railways for 25 years and Austria tried it over a quarter of a century, and they have tried the two methods side by side ever since the public system was organized. In New Zealand also and Australia the two systems have been tried side by side. And in every one of these countries where they have thoroughly tried both systems the conclusion by an overwhelming consensus of opinion is that public railways serve the public interests best, and also make lower rates and serve the people at less total cost. Switzerland, after a careful study of both systems in various parts of the world, has come to the same conclusion, and her people have voted 2 to 1 to transfer the railways to public ownership and operation. All this is very strong evidence, and if we turn from the tangled web of an international comparison of averages and look at the *principles and causes* at work in the case it will be clear that public ownership tends to lower rates as well as to conserve the higher wealth.

If you will examine Diagram II a little, I think it will make the matter much clearer than is possible by any effort to deal with the average rates and the infinite mass of detail behind them.

In figure 1 (p. 142), L O is the rate line with zero rates at the bottom and at the top rates so lofty as to be *prohibitive*; T T T is the *traffic curve* expanding rapidly as the rates are lowered; E E E is the *expense curve*, beginning with the minimum of fixed charges and operating cost which must be incurred even with the smallest traffic, and expanding with the traffic, though not in the same ratio. A considerable traffic can be handled at a slight advance upon the minimum cost (the fixed charges being nearly the same with 60 passengers per car as with 1, while the operating cost is only slightly increased), and for the later ranges of the traffic curve the expense account expands at so much less a rate than the traffic that an enlargement of 100 per cent in the traffic frequently increases expenses only 30 to 50 per cent, and sometimes scarcely at all, as when Hungary adopted the zone system in 1889. R R R is the *curve of receipts*, which is a function of the rate and the traffic, and can be easily platted from them; y R N, the part of the curve of receipts that extends beyond the expense line, represents profits. This *profit line* is platted again at P P z M on the rate line as a base. H I is the *rate level that yields the greatest profit*, and M N is the *rate level that yields the greatest traffic without incurring a deficit*. It is the level at which the line of receipts crosses the expense line, so that there is neither profit nor deficit, but service at cost. M N, the line of greatest traffic without deficit, is always a considerable distance below H I, the line of greatest profit. As you go down the rate line from H the traffic increases and the profit diminishes, until you come to a point where the rates are so low that profit vanishes, and there you have the rate level of greatest traffic without deficit.

Now, private monopoly aiming at profit tends to establish rates at the level H I, the rate level for profit, while public ownership aiming at service tends to bring rates down to the level M N, the rate level for service.

In fig. 2 (p. 142), to emphasize the essential facts, the traffic curve is drawn on a narrower lateral scale, and the profit curve, on an expanded lateral scale, is platted

upon the traffic curve as a base. The profit curve crosses behind the traffic curve at N, the line M N representing the largest traffic that can be secured by lowering rates and yet escape a deficit; while H I, as before, is the line of largest profit, with higher rates but much smaller traffic, H x, than is the case on the level M N.

Private monopoly aiming at profit tends to put rates at H with the traffic H x and the profit x i, while public ownership aiming at service tends to put rates several flights of stairs lower down, at M, with the very much larger traffic M N and no profit. I say "tends," because actual rates may not be on the lines H I and M N—public ownership may place the rates above M N (though rarely or never as high as H I) or below M N, even down to the zero level, and private ownership may, through miscalculation, put rates above H I or below it (though rarely or never so low as M N). The significant fact is that *private rates gravitate to the high level H I with large profit and comparatively small service, while public rates gravitate to the low level M N, with large service and no profit, and in later stages of development may seek a lower level still and even cultivate the zero line.*

The curves in these figures would vary, of course, with the location and character of the business. Under some circumstances a 50 per cent reduction of rates would double traffic and increase expenses 30 per cent perhaps, while in another case a 50 per cent reduction would increase the business 20 per cent and the expenses 10 per cent or 15 per cent. In some cases the traffic curve becomes concave toward the left as it nears the zero level, while in other cases it might be concave toward the northeast and strike the zero level at a great distance to the right. But through all the various phases of these curves the essential facts remain the same, viz: (1) The rate level that yields the greatest profit carries a relatively small traffic and lies above the rate level that yields the largest traffic attainable by lowering rates without incurring a deficit, and (2) *private ownership seeks the high-rate level with maximum profit, while public ownership seeks the low-rate level with maximum service at cost.*

The great point is that the private system looks at this profit line while the public system looks at the traffic line. Private managers regulate this business simply in reference to the profit line, trying to establish rates at the level which will produce the greatest profit regardless of whether it produces the greatest movement in the country or not, or the greatest development of industry; whereas the tendency of the public system is to look to the greatest development of traffic so long as it remains within reasonable cost, and not always that. We make our public highways—not our iron highways, but our stone highways and common roads—absolutely free for the development of commerce and civilization.

Q. (By Mr. CLARKE.) Is that diagram based on actual experience, or is it mere theory?—A. It is based on the results of experience, the laws of movement indicated by actual cases. For the extremes—top and bottom—we have, of course, only general indications from what scientists call "adjacent cases" and from the results of selling water below cost and of making roads, parks, and schools free, and carrying school children and some fertilizers free in New Zealand and Australia. But the middle sections are carefully platted according to principles established by the experienced results of lowering rates on railroad and street railway systems. Telegraph and telephone experience, and actual reductions in rates for water, gas, and other similar services, illustrate the same general truths that business increases rapidly with lower rates, while expenses, as a rule, increase in smaller ratio, and that the rate level yielding the greatest profit is above the rate level yielding the greatest traffic without deficit—this is the universal and essential truth on which I base the proposition that public ownership aiming at service tends to make lower rates than private ownership aiming at profit. However much the shape of the curves may vary in different systems of railroad, street railway, telegraph, or telephone, *their relations* will always be such as to harmonize with and illustrate the fact that the line of greatest profit is at a higher rate level than the line of greatest traffic at cost. So that this diagram is not only accurate but universal in respect to the truth for the illustration of which it is added.

Q. Now, at some stage I would like to have you answer the question, and now, if this is the time when you wish to do it, whether or not there is not, in your opinion, sound economics in the principle that every tub should stand on its own bottom—that is, that every system should produce a good financial result, even a little profit, rather than a deficit?—A. No; I do not think it is a sound economic principle, not as a universal principle, for this reason: morals, intelligence, and civilization are just as vitally related to economics as dollars and cents, and the development of education is just as much a part of the business of an economic system, of a railway system, or any other industry, as the making of profit—in short, the serving of the public good is the only admissible purpose of all public utilities; and if the public good requires that the roads of the country should be

free, I think there can be no sound economics in requiring them to pay cost or make a profit; or if, considering all interests of the higher wealth as well as the lower, the public good requires that the public schools should be free, then any principle that requires them to make a profit can not be sound economics. It is right that the elevator in the building should be run free and the charge put upon the party who rents the building, because of the simplicity of the thing. And if it should turn out with the railways as it has with these other things, that it is best to make them free, there is no economic principle to prevent it so far as I know. There may be a *prima facie* presumption that each service should be self-supporting till good reason appears to the contrary, but when such reason does appear, sound economics requires that it should be heeded. Sound economics will do whatever is best for the community, and if it promotes the public welfare to carry mail, or school children, or fertilizers below cost, and make use of our streets, roads, hospitals, and fire departments free, then sound economics will do it. In most countries, as far as the mass of the business is concerned, the public railways are managed so as to make a little profit, but there is no sound economic principle that would require them to continue on that basis after it became clear that public interests would be better served by running them below cost to secure the education, intelligence, character, harmony, development of industry, etc., accompanying the increase of traffic that results from lower rates.

Q. Now, suppose the nontaxpayers are in control of the Government and seek to have the railways and their public conveniences run at cost, or less than cost, for their convenience and make up the deficit by taxing the people on their property. Does that seem to you to be an improbable result of that system?—A. In the light of the past I should say that it was a very improbable result with the railroads, so far as the near future is concerned, but I should not say that it was improbable in the far future. Let me give you a little summary by Professor Seligman, of Columbia University, which throws much light on this matter.

THE FIVE STAGES OF DEVELOPMENT.

"In all the media of transportation and communication there seems to be a definite law of evolution. Everywhere at first they are in private hands and used for purposes of extortion or of profit, like the highways in mediæval Europe or the early bridges and canals. In the second stage they are 'affected with a public interest,' and are turned over to trustees, who are permitted to charge fixed tolls, but are required to keep the service up to a certain standard. This was the era of the canal and turnpike trusts or companies. In the third stage the government takes over the service, but manages it for profits, as is still the case to-day in some countries with the post and the railway system. In the fourth stage the government charges tolls or fees only to cover expenses, as until recently in the case of canals and bridges, and as is the theory of the postal system and of the municipal water supply with us at the present time. In the fifth stage the government reduces charges until finally there is no charge at all and the expenses are defrayed by a general tax on the community. This is the stage now reached in the common roads and most of the canals and bridges, and which has been proposed by officials of several American cities for other services, like the water supply."

The extent to which public ownership and cooperative effort have replaced individual and private action in any community is one of the surest tests of the degree of its civilization. And the final stage in the case of a great universal utility, such as transportation, is free service, but in the nature of things this final stage is not likely to come or be closely approached very soon, and even if voters should call for such a system before the better wealth diffusion of the future has made them all taxpayers, still the change would not be nearly so unjust as it may seem at first sight, because the property of the large taxpayers has been chiefly produced by nontaxpayers and taken from them by an unjust system of wealth distribution, wherefore the railroad tax would in very large part be merely one step toward a fairer adjustment of wealth and burdens, like a progressive income or inheritance tax.

To come back to Diagram II: We have seen that in the same country and under similar conditions otherwise than in respect to ownership and control public ownership tends to make lower rates than private ownership. *The line of greatest profit is on a much higher rate level than the line of greatest service, and since private monopoly aims at profit it seeks the higher rate level. Public ownership aims at service, not at profit, and therefore gravitates to the lower rate level, where traffic and service are greatest.*

I regard this as a practical demonstration of the generalization as to the tendency of public ownership to lower rates.

ILLUSTRATIONS OF THE TENDENCY OF PUBLIC OWNERSHIP TO LOWER RATES.

A few illustrations of the vigorous manner in which this law works out in practice may be of advantage here.

The Hungarian Government at a single stroke in 1889 reduced State railway fares 40 to 80 per cent. Austria and Prussia have also made great reductions in railway charges. Belgium started in the thirties with the very low rate of four-fifths of a cent on her public railways. In New Zealand and Australia also the government managements have adopted the settled policy of reducing railroad rates as fast as possible. For example, in the New Zealand report for 1899 Mr. Cadman, the minister of railways, announced reductions of 20 per cent on farm products and 40 per cent on butter and cheese, concessions amounting to one-seventh of the railway receipts and equivalent to a reduction of \$150,000,000 in the United States. Following this, Mr. Ward, the new minister, announced a general lowering of passenger fares. In the United States, on the other hand, by reclassification, etc., rates on many products have recently been lifted instead of lowered.

When England made the telegraph public in 1870, rates were lowered 80 to 50 per cent at once, and still further reductions were afterwards made.

When France took over the telephone in 1889, rates were reduced from \$116 to \$78 per year in Paris, and from \$78 to \$39 elsewhere, except in Lyons, where the charge was made \$38.50.

Private turnpikes, bridges, and canals levy sufficient tolls to get what profit may be possible; but when these same highways, bridges, and canals become public the tolls are often abolished entirely, rendering such facilities of transportation free, and when charges are made they are lower than the rates of private monopolies under similar conditions, and generally reach the vanishing point as soon as the capital is paid off or before. The difference between public and private management of such undertakings is strikingly illustrated in the following comparison of the Brooklyn and St. Louis bridges:

The Brooklyn Bridge is owned by the cities of New York and Brooklyn. The St. Louis Bridge is privately owned. The contrast in the management of the two bridges is very great.

CHARGES FOR CROSSING.

St. Louis Bridge (cost \$13,000,000, bought by Gould interests for \$5,000,000):

On steam cars, 25 to 75 cents per passenger.
Street-car fare 10 cents, 5 cents for bridge.
Foot passengers..... 5 cents.
Vehicles, with 1 horse..... 25 cents.
Vehicles, with 2 horses..... 35 cents.
Bicycles..... 10 cents.

Brooklyn Bridge (cost, \$15,000,000):

On L roads 3 cents (2 fares for 5 cents), if you simply wish to cross the bridge—if you come from a distance or are going beyond the bridge it costs nothing to cross it, either in the L cars or the surface cars—the ordinary car fare takes you over without extra charge.
Foot passengers..... Free.
Vehicles, with 1 horse..... 5 cents.
Vehicles, with 2 horses..... 10 cents.
Bicycles..... Free.

Before the recent lease giving the companies the use of the Brooklyn Bridge the public operation realized more than enough to pay expenses and interest, on a 24-cent fare, etc (as above), paying the car men \$2.75 for an 8-hour day. The elevated railway companies running over the bridge pay \$2 for 10 hours, and some of the men receive less and work longer, so I am told by the men themselves. On the electric running over the St. Louis Bridge the men work 12 hours, for which the conductors get \$2.25 and the motormen \$2.

Under the lease the elevated roads pay about \$100,000 a year for the use of the bridge, and the trolleys 5 cents a car, a fraction of a cent per passenger. The franchise charges were made very small in order to arrange matters so that no extra fare for crossing the bridge would be collected from those paying the ordinary 5-cent car fare, thus making the bridge free for passengers coming from or going to a distance, and more than free to those who simply cross it in the bridge cars, since a ride in the cars anywhere else for any distance, no matter how short, costs a nickel instead of the 24-cent bridge rate—nothing for the bridge and half price for the car ride. The arrangement is good for the people and good for the companies, as it increases their traffic. It could only be improved by a larger payment from the companies, or lower fares in general, or, best of all, public ownership of the street railways as well as the bridge.

The net earnings of the St. Louis Bridge are one and one-fourth millions a year, or 25 per cent on the Gould investment, and 12 per cent on the impaisable capital (the excavating of the tunnels, etc., will never have to be done again). The St. Louis charges may be objected to, not only as extortionate, but as discriminating. A passenger who buys a ticket in New York or Philadelphia to go to St. Louis has to pay 75 cents for crossing the bridge, whereas if he buys a ticket to East St. Louis and then crosses the bridge in a railroad train, it will cost him only 25 cents.

The St. Louis Bridge is managed for private profit; the Brooklyn Bridge is managed for public service, the aim being to make the bridge as useful to the people as possible.

When Glasgow took the management of her street railways in 1894 fares were reduced at once about 83 per cent; the average fare dropped to about 2 cents, and 35 per cent of the fares were 1 cent each. Since then further reductions have been made, and the average fare now is little more than a cent and a half; over 50 per cent reduction in 6 years, while we pay the 5-cent fare to the private companies in Boston and other cities of the United States the same as we did 6 years ago, instead of the 24-cent fare we would pay if the same percentage of reduction

had occurred here as in Glasgow. At the same time that rates have been cut down in Glasgow wages have been raised, hours reduced, and the service greatly improved; and the profits of the business go to the people instead of a few stockholders. In the early nineties, when the private tramways of Glasgow were collecting an average fare of 3.84 cents, they declared that only 0.24 cent was profit. Now the public tram lines, with less than half the fare, still realize nearly a quarter of a cent clear profit and put \$200,000 a year in the public treasury above all cost of operation and fixed charges.

According to Baker's Manual of American Waterworks, the charges of private water companies in the United States average 43 per cent excess above the charges of public waterworks for similar service. In some States investigation shows that private water rates are double the public rates. (See City for the People, pp. 20, 195.)

For commercial electric lighting private companies charge 50 to 100 per cent more than public plants. (See Municipal Monopolies, p. 156.) What public ownership can do toward lowering the cost of street lighting may be seen from the following table:

TABLE II.—Cost of electric light before and after public ownership.

[Total cost per lamp year for electric street lights before and after public operation, the "after" service being as good or better than the service it replaced.]

	1.	2.	3.
	BEFORE.	AFTER.	AFTER.
	Price paid private company per lamp year just before public operation began.	Cost per arc, including operating expenses, taxes, insurance, depreciation, and interest.	Cost under complete public ownership, including operating expenses, taxes, insurance, and depreciation, but not interest, there being no interest to pay when public ownership is complete, i. e., when the people own the plant free of debt.
Aurora, Ill.....	\$325	\$72	\$61
Elgin, Ill.....	228	65	56
Fairfield, Iowa.....	375	95	80
Marshalltown, Iowa.....	125	40	30
Bay City, Mich.....	100	67	58
Detroit, Mich.....	132	83	68
Allegheny, Pa.....	180	86	75
Bangor, Me.....	150	58	48
Lewiston, Me.....	182	58	52
Peabody, Mass.....	185	73	62

Column 2 is made up of the operating cost plus 5 per cent on the investment for insurance, taxes, and depreciation and 4 per cent for interest, except where the actual interest is known. With Aurora, Fairfield, Marshalltown, and Bay City the real contrast is between columns 1 and 3, for there is no debt to allow for in those cases. Perhaps the same is true of Bangor and Lewiston. The data in my possession leave that point in doubt in those two cases. The true contrast is always between columns 1 and 3 if you wish to compare private ownership and operation not merely with public operation of a plant the capital in which is still privately owned, but with public operation and ownership complete.

When we are trying to ascertain what it is fair for a private company to charge we must add interest, but when we are trying to discover the effect upon the people of a change to complete public ownership there is no interest on the public side of the account.

The number of lights was greater in several cases under public ownership than with the private supply. On the other hand, the actual candlepower in the public lights is usually higher and the public plants are handicapped by lack of permission to engage in commercial lighting. This more than balances the advantage of a large number of street lamps—300 street lamps plus 20,000 private lamps makes a much larger business and lower cost per unit than 350 or 400 street lamps with no commercial business. Setting this handicap against the increase of street lamps, it seems fair to conclude that the above figures obtained from the reports and officials of the municipalities involved do not overstate the saving power of public ownership.

In the early years before the cost of electric lighting was understood and the companies were charging speculative prices, as in Elgin, Aurora, etc., the change to public ownership caused an amazing reduction. And even in later times the saving through municipal ownership is sufficiently marked. In Detroit, for example, one of the latest cases, the city, when considering the change to public ownership 5 years ago, could get no bid for its street lamps lower than \$132 per arc year; it saved nearly \$50 per arc at the start, and has now reduced the total cost, interest, depreciation, taxes, insurance, and operation to about \$70 per arc, and could cut it down to \$50 or less if the commercial lighting of the city were united with the street lighting in one system under public management.

THE ECONOMIES OF PUBLIC OWNERSHIP.

In addition to the fact that public ownership aims at service rather than profit, and therefore tends to a lower rate level than private ownership, gravitating to the level of greatest service without deficit—in addition to this we must note that public ownership permits economies which pull the expense line nearer the vertical and bring the line of greatest service without deficit to a lower level than it would have in the same system under private ownership. Thus public ownership favors low rates in a double way, first, by tending to bring rates down to cost, and second, by lowering cost.

Some of the reasons for the superior economy of public ownership are as follows:

(1) The public plant has no lobby expenses or corruption funds to raise, as many of the private monopolies have.

(2) It has no rebates or commissions or other secret concessions to favored customers to provide for.

(3) It has no dividends on watered stock to pay.

(4) It has no overgrown salaries or monopolistic profits to provide for. The principal salaries are apt to be smaller under public ownership and the wages of ordinary labor somewhat higher than under private ownership.

(5) Litigation expenses and lawyers' fees are likely to be less under public ownership than with private systems.

(6) The public plant generally is able to save on interest charges. The public credit is better than that even of very strong private companies, the government being able to borrow often at 3 per cent or less when a private company has to pay from 4 to 6 in the same locality. The government also saves on insurance, insurance being simply intended to diffuse loss, the government acting as its own insurer—diffusing the loss directly without paying the commissions and agents' fees.

(7) Public ownership gains through superior coordination of industry, which is impossible under private ownership except through incurring the dangers of a concentration of wealth and power in the hands of a few, the evils of which would be likely to outweigh the benefits of coordination.

(8) The public also gains through the civic interest of the people, which increases and facilitates the business. It is a fact of experience that the people patronize their own institutions, their own water plants, their own electric plants, and their own telegraphs and telephones to a far greater extent than they patronize a private institution. A man does not hesitate to increase the income of a public plant; his civic pride leads him to favor its prosperity; it is his plant; he is a partner in the concern; but the majority of men do not enjoy increasing the profits of a private monopoly.

(9) In the next place, the public plant escapes the costs and burdens of costly strikes and lockouts.

(10) Public ownership saves the cost of numerous regulative commissions and investigations into the secrets of private monopoly. Everything is open and public, and there is no necessity of those tremendous investigations. It also saves in the cost of legislation, since the time and attention of our legislators are very largely given to these great private monopolies, making laws they want and making laws to control them.

(11) The superior diffusion of wealth and elevation of labor resulting from a normal public system tend to diminish the extent and the cost of the criminal and defective and unfortunate classes; as in New Zealand, where they have practically wiped out the unemployed agitation through the administration of public utilities.

(12) The elimination of the antagonism between the owners of vast industries and the public carries with it all the useless activities and wastes of conflict which result from that antagonism.

SAVINGS THROUGH PUBLIC RAILWAYS.

How great are the savings that may result from the elimination of conflict and a thorough coordination of industry under wise and impartial public management may be seen by comparing the economy of such a system with the wastefulness of present railway methods.

While 800 or 1,000 companies carry on their business more or less separately, it is manifest that there must be duplication of management, of general officers, and duplication of railways, and of competitive agencies, duplication of depots, multitudinous ticket arrangements, competitive advertising, the carrying of empties, etc. I need not enumerate all the details; it is clear that the wastefulness of the present system is very great. In England careful estimates have

been made by leading railway authorities—the secretary of the London and North-western Railway Company, the manager of the Lancashire and Yorkshire, and the late eminent railway engineer, Sir Edwin Chadwick—and it is estimated that in Great Britain and Ireland the preventable wastes amount to 20 to 24 per cent of the operating expenses. In this country we have nothing like the union that exists in Great Britain. We have 863 independent systems, while the United Kingdom has only 133.

The whole railway system there is based on an understanding between all the companies, so the current railway literature affirms. The wastes of severance may, therefore, be greater here. But suppose we take it at 20 per cent. we shall find then that the wastes of severance in this country on the basis of the English estimates would amount to \$180,000,000. If we add to this the sums that go to legislative and legal expenses, and the amounts that are given away in free passes which still obtain to some extent, and the rebates that are still given in large measure, our present system of railway management probably costs the people not less than \$250,000,000 to \$300,000,000 more than it ought to cost—\$250,000,000 to \$300,000,000 partly waste and partly unjust increments to private pockets at the expense of the public. All this would be saved to the people by public ownership, and more, for the profits that now accrue to the companies would go to the people in lower rates, or lessened taxation, or added millions in the public treasury.

Moreover, if we had a system owned by the public clear of debt, as is the purpose of a number of the European governments, such as Germany, Belgium, Austria-Hungary, and France, which are aiming to secure a system of railways owned by the public with the capital all paid off, so that the railway system will be in the same condition as to capitalization as the public-road system is now, then rates may be reduced to the lowest possible figure, just large enough to cover operating expenses and depreciation and necessary extensions and improvements from year to year. That seems to me to be the ideal from an economic standpoint. Such bottom rates are of the greatest moment to the people for the improvement of social conditions, the relief of pressure upon the slums of the great cities, and so on. Politically, socially, and economically, low rates of transportation are of the utmost importance. Therefore it was of vast importance for a nation to have so nearly as possible a free-road system, only the expense of keeping it up falling upon the people. So it is of vast importance that we should get as near as possible to a free-railway system, putting upon transportation only the burden of operating expenses and maintenance charges and getting rid of the capital charges. If that were done the people might save about 600 millions of railway charges every year, adding the waste and misappropriation I have spoken of to the interest and dividends and surplus.

Here is an itemized account of the possible savings under a wise public management of railways. It is a statement prepared by me in 1895 for the *Arena* magazine, and is based on the estimates of railroad men:

TABLE III.—*Savings under coordinated public ownership.*

	In mil- lions.	Authority
1. By abolishing 599 presidents, with their staffs.	25	C. Wood Davis.
2. By abolishing the high-priced managers and their staffs.	4	Do.
3. By abolishing attorneys and legal expenses.	12	Do.
4. By abolishing merely competitive offices, writers, etc.	12	Do.
5. By abolishing five-sevenths of the advertising account which is incurred for competitive purposes.	5	Do.
6. By abolishing the traffic associations which are employed to adjust matters between competing roads.	4	Do.
7. By exclusive use of the shortest routes.	25	Do.
8. By consolidation of working depots, offices, and staffs.	20	Do.
9. By uniformity of rail, cars, machinery, etc., cheapening their manufacture; by avoiding freight blockades, return of "em- pties" belonging to other roads, clerks to keep account of foreign cars and adjust division of earnings among the roads; by making simple, easily understood tariffs, saving the time and labor of clerks and the public; by all the numberless little economies of a vast corporation under a single management, and no competitive warfare to waste its energies.	15	The present writer.
10. By avoiding strikes and developing a better spirit among the employees.	10	Do.
11. By abolishing the corruption fund for influencing legisla- tion, etc.	30	Thos. V. Cator.
12. By abolishing the <i>pass</i> evil.	30	C. Wood Davis.
13. By abolishing unjust rebates and commissions.	50	Thos. V. Cator.
Total.	242	

TABLE III.—*Savings under coordinated public ownership*—Continued.

FURTHER SAVINGS BY PAYING OFF DEBT AND EXTINGUISHING CAPITAL CHARGES.

	In mil- lions.	Authority.
14. By having no rent or interest to pay.....	286	By report, 1891.
15. By having no dividends to pay.....	82	Do.
16. By putting surplus in the people's treasury.....	52	Do.
Total savings per year by public ownership free of debt...	662	

I took the year 1891 in order that all the estimates might refer as nearly as possible to the same year. The people paid the railroads in 1891 about \$1,200,000,000. They could have had the same or better service for half the money if they had owned the roads free from debt and under good management, with a well coordinated public system.

We have now well toward a thousand different managements in place of 600, so that some of the wastes in the table have increased, while others have probably diminished. There are other items of saving not mentioned in the table. For example, adoption of the zone system and of cooperative methods in construction, etc., fuller use of safety appliances, a careful system of training railway employees, thorough coordination with the telegraph, telephone, and postal services, street railways, roads, police, and other departments. There is still abundant reason to believe that railway charges (\$1,480,000 this last year) could be reduced about one-half if the nation owned the system free of debt. In view of the fact that traffic is greatly increased by low rates and that the expense per unit both as to operating cost and fixed charges diminishes with the growing density of business, it is probable that rates and fares could be reduced considerably more than half under public ownership with the capital paid up. Even with the higher wages that ought to be paid and would be paid to brakemen, switchmen, and other workers, large reductions in rates would still be possible.

CONSOLIDATION.

In this country there have been about 5,000 railway corporations. About 3,000 of them have ceased to operate, and there are now a little over 2,000 railways—2,047, I think—and of these, there are 863 independent operating companies and about nine hundred and seventy-odd subsidiary companies leased or controlled by the independent companies. Two hundred odd of these—about 213, I think—of the subsidiary companies keep separate operating accounts, so that they are not entirely merged. Now, you see in those few figures that a tremendous movement toward concentration and coordination under private ownership is going on, and there is much at the same time that the figures do not show, for vast combinations are being formed among the independent companies. Coordination is good and ought to go all the way. It would result, as we have seen, in the very greatest economy if the whole railroad system of the country could be run under one harmonious plan and one management, in full coordination with the telegraph, telephone, and postal services.

In the transfer of empty cars, in getting rid of unnecessary stations and accounting offices, etc., great savings can be made—union of depots and all that. This concentration—which is so valuable that the German Government in arguing for public ownership of railroads put it as 1 of the 2 strongest arguments that they had—this concentration and coordination can be obtained under private ownership, but to bring it about under private ownership would result in establishing a power so colossal in the hands of a few men that the present dangers to free institutions resulting from monopolies would be intensified very many fold—intensified to such a degree that it would appear better for the country, perhaps, to forego the advantages of coordination than to have absolute or complete union of these enormous systems under private control. So that if we are to have the benefits of coordination with justice and safety to the Republic, we must attain them through public ownership. A consolidated system of railways in private hands would be a monopoly so vast, so powerful, so irresistible in its influence on legislation and administration that it would constitute too great a danger to republican institutions to be permitted. With private management we have either a lack of coordination or inharmony, or dangerous consolidation—harmony and coordination, together with safety and justice, can only be secured through public ownership.

Moreover it must be remembered that less than a third of the six hundred odd millions of possible public railway savings would be attributable to the element of coordination, over a hundred millions would be due to the abolition of corruption funds and discriminations in favor of privileged individuals, corporations, trusts, and combinations, and several hundred millions more belong to the capital accounts, rent, interest, and profits, and could be realized only by the extinguishment of railway capitalization and the making of rates on the basis of operating cost without profit, things that no private company, or consolidation of private companies, could be expected to do, so that far the larger part of the possible diminutions of railway taxes can only be secured through public ownership, not being attainable under private management, even if we were willing to risk the dangers of complete consolidation in private hands.

Q. (By Mr. FARQUHAR.) If 600,000,000 are taken out of the net returns of railroads, what would be left?—A. I did not say out of the net returns; I said out of the gross returns.

Q. Even say out of the gross returns; how much would that enter into the net results as at present constituted?—A. The \$600,000,000, according to those estimates, would be saved to the common people through the lessened cost of operation and the doing away with discriminative rates and corruption funds, and so on—all the losses of the present system—and the elimination of profits. Without touching profits, the possible reductions might be in the neighborhood of \$250,000,000 or more, basing our calculations either on the English estimates above referred to, or on the table and the comments following it.

Q. If discrimination in rates were abolished entirely by the flat plan of an equal tariff all over, would not that add to the profits of the railroads?—A. It would add to the gross revenues if the present tariff were enforced throughout.

Q. If you abolish all discriminations you are bringing more revenue into the railroads, and you say by the abolition of that, by coordination, etc., that you would save—that was the expression—\$600,000,000?—A. Yes. It would save that much to the common people. If the favored shippers, who get concessions worth 50,000,000 a year, did not receive those concessions the railroads would be \$50,000,000 better off, and could afford to reduce rates to the general public by that much. Discriminations are made, very many of them, by the payment of rebates and commissions. Now, if you do not make those payments, you save that amount of money to your railroad system, and can lower rates in general by so much. Suppose that the roads received \$1,000,000,000, and that \$50,000,000 were given back to favored shippers. Now, you do away with your discriminations and you can get along with \$50,000,000 less rates, can you not, than you could before? That is the point. Every payment or concession, whether positive or negative, to the Standard Oil, the beef combine, the grain trust, or other favorites of the railways, is just so much out of the pockets of the common people, who have no rebates or concessions and have to pay ordinary rates. It is just the same as if the amount of the concessions were added to the salaries of railroad officials, or as if the oil, beef, grain, coal, and other monopolists were put on the salary lists of the roads, and paid amounts equal to the value of the concessions they get. The common people have to pay for those concessions in railroad rates, and they would have to pay just that much less if the concessions were done away with.

Q. (By Mr. CLARKE.) Even if rates were not to be lowered, would you still see a great advantage in public ownership?—A. Certainly; I think the rates are not the main thing. This matter of partiality, personal discrimination, injustice, that is eliminated by public ownership; and the antagonism of interest between the small class owning the railroad system and the public as a whole, which is eliminated in favor of harmony; the relief of the pressure upon Government, tending to control and corrupt the Government, as our great monopolies do so far as necessary to accomplish their purposes and to protect themselves against bad legislation. All those things and others which are—

Q. (By Mr. FARQUHAR, interrupting.) Do you think that human nature changes in public service from what it was in private service in any way?—A. Yes; gradually; not all at once.

Q. Have you any knowledge of any country where it has?—A. Yes; every country. Man is molded by his environment as well as molding his environment. If we look back to the savage times when man began, we can trace through history the interaction between man and his environment, social institutions being a part of that environment. Now, every change toward harmony by elimination of antagonism and conflict tends to make man less barbarous, less antagonistic, less selfish, more sympathetic, brings him into closer relations with his fellows, molds and changes his human nature toward a higher manhood. That is one of the great benefits that I expect from public ownership,

Q. Do you think that in the railroad service of the United States, were it possible—which everybody seems to think is impossible, of course—for the Government to own them—do you think it is possible to serve the people better, have a more intelligent service by a public service, whether under civil service or not, than you have under the great brotherhoods that control the roads now?—A. Not perhaps a more intelligent service, but an equally intelligent service, aiming at the public good instead of at private profit under the control of the monopolists, not under the brotherhoods, for the brotherhoods do not control the roads, as is clear from the long hours and low wages of most of the men.

Q. Would you abolish the brotherhoods that are on the railroads now and bring in a civil service?—A. No; I would not abolish the brotherhoods.

Q. How would you employ your public servants on the public roads?—A. I would leave the present employees (when the different roads are taken) in the positions they occupy at the time of the transfer, subject to the condition of dismissal for lack of loyalty, under strong civil-service rules, made a part of the law under which the railroads are taken over, all new appointments and employments and dismissals being placed under those rules, and so the change from one system to the other would be made gradually, not by any sudden jolt.

Q. But in the long run that would tend, of course, to eliminate the present form of brotherhoods as they are now?—A. Oh, no; let the unions and brotherhoods stay as long as they want to.

Q. (By Mr. LITCHMAN.) Does the management of the railway post-office service under the Government eliminate the organization of railway postal employees?—A. Not that I know of. Trade unions are frequently opposed and sometimes broken down by private monopolies, but not by public managements. Unions are encouraged in New Zealand under the public service; the workers can not get their full rights under the law unless they do form a union. It is only the unions that can elect their judges to the appeal board.

PUBLIC BENEFITS ASIDE FROM LOW AND IMPARTIAL RATES.

The next point I would like to speak of very briefly is public service, aside from rate making. Take the matter of construction. In New Zealand the construction of railroads is so arranged as to relieve depression instead of creating panic, as our railways have been known to do. In 1873 we had what was practically a railroad panic. And overconstruction of railways in a time of prosperity is thought to be responsible in other instances for intensifying depressions and panics. In New Zealand and Germany the definite effort of the Government is to increase railroad construction in times of depression and to let up on construction in times of boom. In that way they get a double advantage. They equalize the labor market and the control of industry, and they get the railroads constructed at the times of lessened cost instead of at the times of higher cost.

Moreover, the management uses railroad construction and the adaptation of it—increase and diminution of it—to aid the farmers in obtaining the labor they need in harvest time. When winter comes and the unemployed are numerous, the railway managers increase their construction force. When summer comes, and the farmers want harvest hands, the managers slacken the work on the railroads and other public works, so that the men can go to the farmers.

In still another way railroad construction in New Zealand is used to aid the laboring people. The management lets out contracts for construction directly to cooperative groups of workers. A group of laborers contract for a given section of earthwork, another group for laying the ties, another group for laying the rails, another group for grading and repairing the road, another group for building stations and public buildings of various kinds; even iron bridges have been constructed in this way, by groups of cooperative laborers—anywhere from 6 to 50 or 100 men, who elect their own foreman and divide their money equally, the amount paid being determined by the engineer of the railroad system. The result is that the average wages made by the men are nearly double what they were able to make under the old system of private contract, because the men, knowing that the profit is to be theirs, put a great deal more energy and interest into the work, and consequently the state has secured its railways at a lower cost in every instance, so it is stated in their reports, than was the case under the old system of dealing with boss contractors. The elimination of the profits of the contractors and the stimulation of the industry of the men has resulted in these two conspicuous benefits, (1) affording the men double wages nearly, and (2) giving the state its construction at lower cost; beside favoring the development of sympathy, of cooperative effort and of ability to understand each other's efforts and interests. I believe that one of the greatest and most important tests of civilization is the

growth of cooperation. When men were mere savages and barbarians they were incapable of any cooperation. As they were developed they became capable of working in little groups, and larger groups, and larger groups, until finally they are able to work together in the all inclusive group of a public utility, and only as these larger groups of voluntary cooperations federate into a complete cooperation, and finally merge into the great all-inclusive circle of public ownership do we come to the final goal of civilization—the elimination of conflict and the replacement of it by harmony, by cooperative work for the benefit of all, instead of the mastery and conflict of most by the few for the benefit of the few. I believe that is the goal and the test of civilization, and, if so, the public systems in Germany and in New Zealand are emphatically superior to any private system under this test.

Germany controls her railways in such a way as to coordinate them—that is true of other public systems also—coordinate the railways with the telegraph, telephone, and post-office, and every other public service. The railway tariff, for example, is made to enforce the national tariff instead of nullifying it as our railroads are apt to do. For example, a few years ago, it appeared from the testimony in the Texas and Pacific cases that foreigners could ship from Liverpool or London through New Orleans to San Francisco and the Pacific coast, books, matings and carpets, confectionery, boots and shoes, hats and caps, gloves, linens, cashmeres, and so on, at a blanket rate of \$1.07; whereas, from New Orleans domestic products to San Francisco went at rates from \$2.88 to \$3.70. That is only one instance of the practical nullification of the protective tariff by our railroads; whereas, in Germany railroads not only do not nullify the policy of the state in regard to the tariff, but they enforce it, and they can actually establish protection to home industry by making the rates on foreign products higher than on domestic products, and they can admit raw materials for home industries at very low rates, so doubly encouraging home industries.

In one way more, with grand results, Germany has introduced the cooperative and coordinative principle into her railway system. The railways are governed by the minister of public works at the top (with a national advisory council), 20 railway directories, or district superintendencies (with 8 circuit advisory councils), and 6 classes of local officers (operating, machine, traffic, shop, telegraph, and building). One of the principal duties of the local-traffic office is to maintain a "living union" between the railway administration and the public. The chiefs of these offices are required to get into intimate relations with the people of their localities. Each local traffic chief, "by numerous personal interviews and observations, must inform himself concerning the needs of the service in his district, investigate and remedy complaints and evils without delay, and take such measures as will secure the most efficient service."

The local advisory councils are composed of representatives from chambers of commerce, labor organizations, farmers' unions, dairy associations, merchants' clubs, etc.; all sorts of industrial and social combinations are represented in these advisory councils, and the law requires the directories to consult these advisory bodies. The people, organized, according to their interests, into various forms of industrial union (chambers of commerce, labor unions, farmers' associations, etc.), elect the members of the local advisory councils, and these councils in turn elect 30 out of the 40 members of the national advisory board, the other 10 members being appointed, 3 by the minister of agriculture and forests, 3 by the minister of trade and industry, 2 by the minister of finance, and 2 by the minister of public works, state officials being ineligible. These advisory bodies do actually discuss with the greatest force, clearness, and effectiveness all sorts of questions about rates and classification and the conduct of the railroads; they make their recommendations and suggestions, and they are very largely followed. So that in Germany to-day the railroad system is practically in the hands of the people to manage and direct. The roads are actually operated in the interests of the people on one of the most democratic and cooperative plans it would be possible to imagine, it seems to me.

Q. You were speaking about cooperative construction in New Zealand, and I wish to know in that case who owns the facilities and apparatus. Supposing they were constructing a bridge, who would own the derricks and the hoisting engines and all that?—A. The state owns the machinery; but, adding the cost of supplying machinery to wages paid for the work, the total cost to the public is less in every case than under the middleman contract system, and since the abolition of the middleman and the establishment of the cooperative system, 9 years ago, there has been no unemployed-labor agitation in New Zealand.

(Whereupon the commission, at 12.55 p.m., took a recess until 2.30 p.m. The commission reassembled at 2.37 p.m., Mr. Parsons continuing his testimony as follows:)

I want to say that I do not believe personally that we are ready yet for the public ownership of railroads in this country. I should have stated that more definitely at the start. I believe we are never surely ready for the public ownership of anything in a republic until the people as a mass are thoroughly and earnestly awakened to that desire, and so, though I believe we are ready for public ownership of the telegraph, the public having expressed a desire for that for the past 50 years, I do not believe that public sentiment is sufficiently developed as yet to make us ready for public ownership of railroads; but, comparing the two systems throughout, I think there is very strong reason to believe that public ownership is the best, and will be the ultimate outcome when the people come to understand the matter fully. And I believe it is of the utmost importance that the people should be informed on the subject, so that they may make an intelligent decision as to the merits of the two systems.

SAFETY.

We come now to the question of safety. Which system is most likely to care for the public safety? Such special care for public safety as we have obtained on the railroads of this country and on the railroads of Great Britain has been obtained chiefly through severe legislation or direct and strenuous legislation, often resisted by the railroads. For example, the laws about grade crossings, and about keeping stoves in passenger cars, and about various safety coupling arrangements, and so on, have usually been resisted instead of being cordially adopted.

I remember a case in regard to the street railways of Philadelphia, when the presidents and makers of the roads came to consider the matter of putting on safety fenders, and an inventor had a fender that had been tested, and it was found that it would act like the fenders now used in Budapest, that will roll a child from the track without even bruising it seriously; but when it was found that it would cost \$50 a car to put it on the street cars of Philadelphia, the magnates made a little calculation, and found it would be cheaper to keep on paying damages for breaking legs and running over children. Afterwards a law was passed requiring fenders, and the roads delayed a long time until they were forced to get fenders, and then put on the cheapest kind they could get; and the fact is, in Philadelphia now, if a man is struck on the leg by one of those fenders, it would probably be as bad or worse than the blunt edge of the car. The fender has an iron edge anywhere from 6 inches to a foot from the ground, and would more certainly break him in two than if he was struck by the car itself.

When I come to the statistics in regard to accidents in various systems, public and private, I am not able to make out that the influence of ownership is the dominant one. I have here a table which I will incorporate in the testimony, with the permission of the commission:

TABLE IV.—*Railway accidents.*

	Passengers.		Employees.	
	Killed, 1 in—	Injured, 1 in—	Killed, 1 in—	Injured, 1 in—
United States	2,267,000	170,141	447	28
Germany	10,700,000	1,700,000	966	385
Austria-Hungary	8,781,000	652,000	1,560	200
Belgium	10,000,000	614,000	1,360	616
Great Britain	9,000,000	800,000	1,070	43
Switzerland	8,826,000	710,000	1,015	347
France:				
Public roads	12,000,000	4,000,000	1,175	390
Private roads	5,000,000	1,000,000	1,000	320

The Swiss and Austrian figures are for 1897; the rest are for 1898. The Austrian figures include a large block of private railways. I have not as yet secured the separate data. The English data as to employees are taken from *The Engineer*, London, January 28, 1900; the yearly returns of employees injured appear to have been, till recently, very imperfect.

It is made up for the United States, Germany, Austria, Great Britain, and France, and it appears that a passenger is about 5 times as likely to be killed in the United States as in Germany, and about 10 times as likely to be injured,

while a railway employee is more than twice as likely to be killed on our roads and 13 times as likely to be injured; but a comparison of the roads in Great Britain and Germany affords no such striking contrast. The result is not the other way; it is in the same direction, but nowhere near as strong, showing that the matter of ownership is not the dominant factor in the statistics of accidents. In France on the public railroads there is 1 passenger killed to 12,000,000, and on private roads 1 to 5,000,000—the private system being more than twice as dangerous so far as killing passengers is concerned. And 1 passenger is injured in each 4,000,000 on public roads and 1 in each 1,000,000 on private roads—4 times as dangerous on private roads as on public roads in France; and it is also more dangerous for employees on the private roads.

Q. While you are on that point, state how these data are made up.—A. From the reports of the French minister of railways.

Q. In proportion to the population and miles of railroads?—A. No; in proportion to the number of passengers carried. In Germany 1 passenger in 10,700,000 is killed, while in the United States it is 1 passenger in 2,267,000, and by a still later report the ratio is 1 passenger killed in every 2,189,000 passengers carried, 1 injured in each 152,000 passengers; 1 employee killed in 420 and 1 injured in each 27, showing an increased danger in the United States since 1898.

There is one thing further to be said about France, namely: The private roads consist of the great systems, while the public roads in France are comparatively small branch affairs, and that may account for the difference in safety. I am not able to come to any satisfactory conclusion about that.

CAPITALIZATION.

My next point relates to capitalization, and here there is a tremendous contrast. The tendency with the great private monopoly is to build up capitalization year after year, and decade after decade, adding together the cost of the original plant and the cost of all improvements, reconstructions, etc., until, even with honest bookkeeping and without any stock watering, the capitalization, by simple accumulation and accretion, comes to be 2 or 3 times the actual worth of the plant.

Q. (By Mr. A. L. HARRIS.) That is the face value, is it, and not the amount received by the company?—A. No; I am talking about the actual cost put into the road. It accumulates year after year, till it far exceeds the real value or cost of duplication of the plant.

Q. Not the face value of stock and bonds?—A. No. When we come to that, the face value of the stock and bonds, there is a great increase beyond the total capital cost—beyond all that has been put into the roads—a great expansion through the watering of stock and through the inflation of values otherwise than by accumulation of worn-out construction costs.

I do not suppose it is necessary to give illustrations, as it is so well known to be the tendency of our railroads, telegraph, telephone, and street railways, but I might name one of the most conscienceless cases, that of the Boston gas system, where some years ago, I think in 1888, the capitalization was less than \$4 per thousand feet of output. That was about fair. Between \$3 and \$4 capital per thousand is the actual value in large cities, according to the gas experts. Since that time the Boston companies, by a complex system of consolidation and increase of stock upon consolidations, and leases and contracts, and so on, have gradually worked their capitalization up until it is \$43 per thousand feet of output, or about 10 times—more than 10 times—the fair capitalization.

Take the Metropolitan system of street railways in New York. It appears from an estimate made last year, based upon the testimony obtained by one of the legislative committees of New York as to the cost of making railroads in New York City, that the market value of the stocks and bonds of the lines owned by the Metropolitan Company was then 23 times the actual value or cost of reproduction of the said lines, according to the evidence given. That is another very strong case.

The prevalence of water in the railroad system is so well known that it is not necessary to do more than touch upon the matter. Vanderbilt set the pace in consolidating the 11 roads between Albany and Buffalo and increased the capitalization by nearly \$9,000,000 in doing it, then adding 50 per cent to the stock capitalization of the Hudson road, of which he was president; then extending his control over the Central and adopting the same tactics there he added 80 per cent to the New York Central; then he consolidated the two roads, and in doing it inflated the Central 27 per cent more and the Hudson 85 per cent; so that in the 4 years from 1866 to 1870 he brought the capitalization up from \$54,000,000, which was a little more than the total cost on the books of the company—about \$4,000,000

more—to \$108,000,000. The total cost on the books in 1870 was under \$70,000 per mile, while under his capitalization it was \$122,000 per mile.

That example has been followed to a great extent all over the country, so that our railroad capitalization is now about half water, or water and wind. The figures of construction and equipment cost given in Poor's Manual from time to time indicate that the railroads of the United States are capitalized at about double what they could be built and equipped for at the present time.

Q. What about the total capitalization?—A. A little over \$60,000 a mile; and the actual value, according to Poor's figures as to the cost of reproduction, would be under \$30,000 a mile.

Q. In round numbers what is the total capitalization of the railroads?—A. Something over \$11,000,000,000.

Q. (By Mr. LITCHMAN.) That is, outside of the bonded debt?—A. No; including the bonded debt.

Q. Also includes the bonds in the capitalization?—A. Yes.

Q. (By Mr. PHILLIPS.) Is it fair to include both the bonds and the stock as capitalization?—A. Yes, I think so; for this reason: Take the ordinary manufacturer or business man without any monopoly, and it is clear that he can not make his prices any more than is necessary to pay him a reasonable profit in a competitive market on the actual capital value or cost of reproduction of his plant. He can not mortgage his business and issue bonds and pay interest on that out of his prices and still expect to make a profit in the way of dividends for himself. If he tried it, some business man without any bonds or mortgage, who would be satisfied with one profit on the actual investment, would undersell him and drive him out of the market. The merchant, farmer, or manufacturer can not make his customers pay interest on bonds equal to the capital invested and dividends on stock equal to the real capital also. He has to be satisfied with one profit on the actual capital cost of reproduction, and that is right. It places the monopolist at a great advantage in reference to the everyday business man, and especially the small people, if either the bonds or stock or both together are allowed to go beyond the actual value of the plant and become a charge on the community.

Q. (By Mr. CLARKE.) Do you think the present cost of reproduction of a plant is a fair test of the capitalization?—A. I think so, for the reason that I have just stated. It is the test with the manufacturer and the agriculturist. The point I wish to bring out, though, is this: Not to blame the railroads especially, although I do not think they have acted fairly in the matter, many of them, yet they have acted much more fairly than the gas people and street-railway people in many instances; but I wish to bring out the total difference of policy under the public systems where there is no water or inflation, no policy of building up capital from year to year, but exactly the opposite policy of reducing the capitalization from year to year by devoting a certain fund to paying it off so that in the course of 20, or 30, or 50 years the capitalization shall be extinguished, and the railways or other service shall be open to the use of the people at rates just high enough to cover the actual cost of operation and depreciation. That is the policy which is being definitely carried out in Belgium with the railroads, and on the German railways, and the railways of Austria-Hungary; and France, even, has made an agreement with the railways whereby in the middle of this twentieth century they are to revert to the State, as I understand it, free of capital cost. The Swiss Federal Council, in giving their reasons for desiring public railways, made this matter very emphatic; they said, "We are surrounded by countries who are aiming to reduce rates to the lowest practicable figure. If they do accomplish that in the course of the next half century, and we leave our roads to pile up their capital year after year as they are doing, we will be at a great disadvantage. Our rates will be so high that we can not possibly compete, and we will not get any through traffic, but get absolutely nothing except the rates from our own people." That was very influential, I am told, in producing the remarkable vote of two to one in favor of the nationalization of railroads in Switzerland.

STOCK GAMBLING.

Passing from that point, the next one is that railway capitalization, and especially the stock part of it under the private-monopoly system, supplies an opportunity for the speculation and gambling which goes on in New York and other cities, to the great detriment of our industries and to the detriment also of the ideals of our youth. Just so long as our young men feel that there is a chance for them to gain wealth by speculation instead of by honest industry, so long will they turn to speculation instead of relying on useful work—to just that extent we are holding before them a premium to devote themselves to gambling instead of fruitful labor—putting the premium on activities which are not nearly so beneficial to

the public, to say the least, as honest industry is. The public system, on the contrary, by wiping out this railway stock, and gas stock, etc.—the fluctuating securities on which the gamblers of the stock exchanges rely—causes a marked reduction in the speculative and gambling elements in our business life.

COORDINATION.

Then, the point of coordination, which I have briefly referred to before, but wish to emphasize here in a little different way. In Germany, Belgium, New Zealand, and Austria-Hungary, where are the systems I have mainly studied, the railway service is coordinated with the telegraph, telephone, and all other public services in such a way that each one aids the other to the utmost. For example, in the European countries you can telephone your telegram, and in some places you can do it, without charge. They regard the telephone as a feeder to the telegraph, and they use each one of the systems of transportation to help the others.

ANTAGONISM OF INTEREST.

Now, this coordination and unity for public service and the public good, which is so natural to public enterprise, is directly opposed to the antagonism of interest between a small body of owners and the public which characterizes private monopoly. From the antagonism of interest between the owners and the public, I believe, grows nearly all the evils that we have experienced from private monopoly, and also the great difficulty of enforcing the law in the public interest. It is because the owners wish profit, and have the vast power which the great public monopoly gives them to enforce their will, that they are able to make these discriminating rates between big and little shippers and between the city and the country. They can discriminate against a man, a company, a street, a town or city, a State or a nation. They can make the fortune of a city or of a man, or make or mar the fortunes of an industry. They can ruin or build up a city, man, or State, and they are prompted to use that great power against the public interest because of this antagonism of interest between the small group and the whole. That antagonism does not exist to anything like the same extent in any of the countries where the railroads and telegraph, and so on, are owned by the State, and under the best systems it does not exist at all.

THE TEST OF MOVEMENT.

My next point is one that is somewhat novel, but I think I may perhaps make clear what is in my mind by calling your attention to the fact that one of the main differences, and perhaps the whole difference, between a man and a piece of stone is a difference of movement. I suppose there is a certain movement among the particles of the stone or it would be down to the zero of total cold—a little heat movement—but the rock is not able to move itself; it has none of the motions which we call life. And those differences which distinguish a man and a rock exist in a less degree between one man and another, and between one nation and another. Other things being equal, the nation that has the greatest, freest, and most harmonious movement of its molecules among themselves is the most advanced nation, the farthest removed from inanimate existence. This motion of the molecules of the nation—its citizens and their possessions—produces what may be called social thought, wealth, activity of every kind, and social progress. The amount of free, harmonious motion among the molecules of society being one of the basic tests of civilization and evolution, it is fair to ask which of the two systems under consideration conduces most to such molecular motion. When we compare the two systems in respect to this matter of social dynamics we find that the public system greatly excels in its facilitation of the molecular movements that underlie and create social heat, thought, life, and progress. Take a couple of illustrations. In 1869, the year before Great Britain made the telegraph public, there was one telegram to each five persons; in this country at the same time there was one telegram to each three persons. England made her telegraph a part of the public post, and now there are two telegrams per capita in England and about one in this country. In other words, when both systems were private we were nearly twice as far along in the rapid transmission of intelligence as England, but when she changed to the public system and we kept on with the private system she gained on us and passed us, so that her movement of thought along the electric wire is double ours. New Zealand and some of the Australian colonies also have two telegrams per capita where we have but one.

Again, taking railroad movement. In 1888 a comparison was made between Germany and the United States and it was found that the United States had nearly 7 passenger trips per capita to 5.3 in Germany. But in 1890, comparing the records, there are just about 10 passenger trips in the United States and just about 10 in Germany also; almost exactly alike, though the German figure is a fraction above ours. So that again in the railroad movement the change to public ownership has enabled Germany to gain greatly upon us and even surpass us in that movement, in spite of the much greater general activity in the United States; industries which are private in both countries or public in both countries, like the post, showing very much greater vitality and movement here than in Germany. It is easy to see why public ownership increases social movement and vitality. Take the telegraph—our telegraph system confines itself to the better districts, and the companies are not to be blamed for doing it at all: it is in the nature of a system built for profit that it must confine itself to the profitable routes. It does not put lines into the rural districts where lines will not pay; it can not do it. The English private companies did the same thing before 1870, but when the lines were transferred to the State one of the first things the Government did was to extend them very greatly. They more than doubled the facilities, lines, and instruments, and the facilities were increased many fold by making every post-office and post-box a depository where a telegram could be placed. So the difference is inherent in the two systems, without any blame at all being placed on the private system that must naturally and necessarily promote first the private interests.

Another striking illustration which must not be neglected is what took place in Austria-Hungary in 1889, when the zone system was introduced. Rates were reduced from 40 per cent to 80 per cent, and the traffic more than doubled in the first year—an enormous increase in the wealth-creating and thought-producing, sympathy-developing, civilization-making activities of the nation.

As I have already stated, in England, when she took the telegraph and increased the facilities and lowered the rates from one-third to one-half, the result was an increase in traffic which doubled the number of messages in less than 2 years, and doubled the word-miles in 1 year. The term "word-mile" corresponds to the "ton-mile" in freight transportation and the passenger-mile in passenger traffic. One word going 1 mile is a word-mile.

DIFFUSION OF WEALTH.

Now, I want to speak a moment of the question of wealth diffusion—the effects of the two systems in regard to the distribution of wealth. The private system tends to the congestion of wealth, and not to the diffusion of it. Our railroads and telegraphs are recognized without dispute as being large creators of great fortunes, and the railroads, at least, are indisputably largely connected with the growth of other great monopolies which tend to the congestion of wealth. Many of the trusts in their inception owe their growth and power to railroad favoritism. The beef combine, for example, and the oil trust, and so on.

After a trust is once on its legs the removal of railway privileges might not break it down in many instances, but so far as the origin of trusts is concerned a private railway system is of the utmost importance, and with many trusts and combines the railroad system is of great importance to the maintenance of their power.

While I am on that matter of trusts, however, I want to say I am not one of those who believe that public ownership or complete control of the railroads would abolish the trust evil. I do not believe that taking away the protection of the tariff from trusts would do it. Neither am I in favor of destroying the trusts, but only of molding them into good forms and directing their energies in proper channels. I think that the organization of capital is one of the greatest advances of the age, and that trusts, on the whole, represent a movement in the line of progress. Each trust is a brotherhood or cooperation on the inside. It gets rid of the conflict between the different manufacturers or producers who enter it, but intensifies the antagonism that is left between that group and other groups and the public.

Now, if we carry the process of trust making a little further—the same process of organization of industry and cooperation—if we extend the limits of the trust idea in some way so that it shall cooperate not only internally but externally, we have solved the trust problem, and I think that can be done without serious break simply by good laws of taxation and other laws which shall make the advantages of organizing capital on the lines of cooperative industry so great and the disadvantages of organizing on competitive and antagonistic and anti-

public lines so great that capital will voluntarily, of its own motion, tend to organize along cooperative lines instead of antipublic lines. For example, take the ordinary level of taxation on common competitive business as a median level, and for antipublic aggregations of capital that refuse to open their books to public inspection, refuse to cooperate or to allow prices and wages to be fixed by a board of arbitration or public tribunal—for such aggressive combines make the taxes higher and higher in proportion to their size and antagonistic spirit. On the other hand combinations that would open their books to the public and allow the fixing of profits and wages and prices to a greater or less extent, either on a sliding scale or by a board of arbitration, should have rates of taxation below the median level—rates progressively lower in proportion to the size of the combine and the degree of public spirit and cooperative method manifested by it. By such taxation cooperative organization would be encouraged and aggressive organization repressed. The motive of trust formation is profit. So long as profit is linked with aggressive, antipublic organization, capital will flow in that direction. If we can sever profit from that sort of organization and attach it to cooperative, open-hearted, public-spirited organization, capital will unite in cooperative forms. This change in the incidence of profit can be made by well-adjusted progressive taxes—aggressive combinations can be taxed so heavily that it will mean loss instead of profit, leaving cooperative combination the only form of organization from which the promoters and participants can derive a profit.

In some such way as that I think we can solve the trust problem along the line of voluntary association instead of along lines of repression, or of public ownership of manufactures.

Now a word more about the diffusion of wealth. In all these countries, Belgium, Germany, Austria-Hungary, and so on, the railroads and telegraphs and telephones are instruments of wealth diffusion, not millionaire mills nor pauper factories. They do not manufacture great fortunes for individuals and they do not force together large populations in the slums of cities.

The policy of New Zealand is definitely and expressly in favor of wealth diffusion. Everywhere in New Zealand the people and officials express the intent "to have no millionaires or paupers." They administer the railroad system and every other public system, including the land system, with direct reference to that intent—to diffuse wealth—and that is the reason the railroads carry the unemployed below cost and give them work in cooperative groups, and help to keep up wages by cutting out the profits of great contractors, and so on.

They deal with trusts, as Germany does also, to some extent, by threatening that if they do not make fair prices, low rates will be given to small concerns at a longer distance, and so bring competitive products to cut down the prices of the combinations. They make a direct effort to prevent the accumulation of vast power and wealth in the hands of the few.

DEMOCRACY.

Now a word as to the attitude of these two systems, public ownership and private monopoly, in regard to democracy. The whole trend of history in our century is toward democracy in political life, and I suppose none of us Americans would dispute the wisdom of that tendency. We all believe, I presume, in the reasons on which it is founded—to protect the people against injustice, sure to result if great power is in the hands of the few—arbitrary, irresponsible power; and to develop and educate the people through the activities and responsibilities of self-government. These reasons apply just as truly, I think, to industry as they do to politics. Arbitrary industrial power in the hands of a few leads to oppression just as surely as arbitrary political power. Political justice requires that every member of the political group of reasonable age and discretion shall have a voice in the political control of the group, and industrial justice requires that every member of an industrial group of reasonable age and discretion shall have a voice in the industrial control, helping to determine the policy of the group and elect its officers. The educational reason also applies with full force to the democratization of industry, for quite as much development of mind and character is to be attained through sharing the responsibilities of industrial government as by participating in political government. Moreover, real political democracy is hardly possible where you have industrial aristocracy or the concentration of industrial power in the hands of the few. If a few men control the great railway systems, telegraphs, and so on, they will necessarily have an enormous control not only over industry, but indirectly over political and social affairs; so that perfect and real equality before the law and equal sovereignty or democracy in government can hardly be secured unless democracy in industry is joined with democracy in politics.

In fact I believe that the underlying cause of the great unrest of our time is that we have experienced an enormous progress in the accumulation and diffusion of intelligence, and in the diffusion of political power at the same time with an ever intensifying congestion of power and wealth in the industrial field; and the two things can not coexist; they are incompatible. Democracy of intelligence can not continue side by side with aristocracy and concentration of power in industry.

So it appears to me to be of fundamental importance to consider the attitude of the two systems in this relation, and it is of course apparent that the publicly owned monopoly is much more in harmony with the principles of democracy than the private monopoly. The whole people own the public plant. The employees and all the citizens are copartners and coowners. All have a voice in the management and all receive a share in the profits and benefits, whereas under the private system the power and profits belong to a few.

If you should run over the list of the directors of the Western Union, or take the names of the leading men in the railway systems, you would see how deeply true it is that the great fortunes are clustering about these monopolies, because they are produced by and fostered by these monopolies.

The very reason men try to get a big monopoly is that it enables them to obtain more than a fair remuneration for the services they render, and more than they could get in an open competitive market, and just so long as they have private monopolies they will be able to get more than a fair remuneration.

PRIVATE MONOPOLY MEANS SOVEREIGN POWER IN PRIVATE HANDS.

I would like to make this point as clear and definite as I can. Not only does a private monopoly in these great industries antagonize the principles of democracy and tend to establish the principles of aristocracy—concentration of power and wealth in the hands of the few—but it also involves the exercise of what is truly sovereign power by private individuals in private interest.

John Stuart Mill and other economists are agreed that the charges of monopolies engaged in essential services are really in the nature of taxation; and taxation is certainly a sovereign power. Monopoly of a great public utility, like transportation, involves the power of levying taxes on the community. I would go a little farther and say that the great monopolists are able not merely to tax the people, but to tax them without representation and for private purposes; the people are not represented in the body that fixes the monopoly taxes, and the taxes go into private treasuries. Now, taxation without representation was the cause of the Revolution; and the insignificance of the taxation then in question, compared to the taxation which the masses of the people are suffering at the hands of the monopolies now, is very evident. If this taxation, levied by our home monopolies, was levied by an outside power across the water, there would be a revolution in this country without doubt. But we are estopped from any revolution, or any serious objection so long as the laws remain as they are, because we have assented to the growth of this system, and we are almost as much responsible for it as the railroads and telegraphs themselves.

But further, it is not only taxation without representation, but for private purposes, and please note that no legislature in the civilized world has power to do that. That is not merely sovereign power—that is ultra sovereign power—power beyond the reach of any accredited sovereign under free institutions, under constitutional government.

In the second place, the control of the ebb and flow of commerce in foreign goods in competition with domestic products which we call the tariff—the protective tariff—is a sovereign power, and, as I have shown, the railroads are able to nullify or to make duties of that kind inoperative, usurping thereby the sovereign power of regulating international trade and even overruling, in effect, the regulations imposed by Congress to govern such trade.

In the third place, the railroads can make and unmake cities; they can make and unmake private fortunes, and even make or mar the fortunes of a whole State or section of the country. That, again, appears to be a power that should not be lodged anywhere but in a sovereign, and hardly there. I can not conceive how, under free institutions, that power should exist anywhere. The aim should be equalization and not the making or marring of one person, city, or State at the expense of another.

Again, great monopolies are able to exert a very large control over our governments themselves. We are all familiar with the fact that the great railroads, particularly in New York, Pennsylvania, and Illinois, carry the legislatures in their vest pockets; and one of our legal writers, Mr. Lawson, writing on railroad

law some time ago, warned the student of railway decisions not to pay much attention to what the supreme court of Pennsylvania said on railroad matters, because, so far as he could make out, the Pennsylvania Railroad ran the supreme court in Pennsylvania about as successfully as they did their own trains. There is some good ground for such statements as that.

Vanderbilt used practically to own and control the New York legislature until Fisk and Gould came on the carpet, and then it was a question which of the two great railroad interests should get its bills through and carry its points in court and legislature; but until there is a fight between great monopolists the legislature usually yields to the persuasions of any great monopoly.

Even in Massachusetts, where we are supposed to have a pretty good state of affairs, we find it practically impossible to do anything effective in the legislature against the railroads, or the street railways, or the great gas and electric light interests. When we did succeed, after several years' effort, in getting a gas and electric light law permitting the cities to establish municipal plants, the monopolists succeeded in putting in a clause which nearly nullified the benefit of the law by making the conditions so severe that towns and cities have found it very difficult to take advantage of it. The law establishing the State board of gas and electric light commissioners was drawn by the attorney of the gas monopoly—drawn to protect the companies and put the public to sleep, while giving it little real benefit. And when a commission was sent by the legislature all over the country to study public gas plants and electric-light plants, they took the attorney of the gas and electric light companies along, and in one instance, at least, it was shown that the gas attorney wrote the report, and of course the report did not say anything very favorable to public ownership. The superintendents of two or three places wrote letters objecting and saying they had been totally misrepresented; and the superintendent of the gasworks in Richmond wrote that the report contained positive lying and totally misrepresented the facts.

Governor Pingree said, after his experience as mayor of Detroit, that the street railways owned the council body and soul. They would pay \$3,000 for a member and even tried to buy the mayor himself, offered him \$75,000 to sign a bill, and another time the monopolies offered him a trip around the world if he would do something they wanted him to. In city after city and State after State we have the testimony that these great monopolies are exerting their influence to control the government.

In all these ways therefore the private monopolies involve the exercise of sovereign power, and in some cases even ultra sovereign power, and such power ought not to be intrusted to private hands. Only the people have a right to own the great monopolies, for only the people have a right to sovereign power.

JUSTICE, GOOD GOVERNMENT, AND OBEDIENCE TO LAW.

Public ownership tends to justice by eliminating personal discrimination in rates, by making fairer rates to develop the country in every way, and by treating the employees in a more just and humane manner as a rule. The tendency is to increase wages and shorten hours. The aim and purpose is more likely to be in the direction of justice than where personal interests dominate the policy of the system.

As to good government: In the first place, so far as the pressure upon legislative government is concerned, the removal of the great private monopolies would clearly abolish one of the principal causes of our present difficulties with legislative bodies; but when we come to the administrative side of the government we are met by the difficulty of an increase of patronage, which undoubtedly is a very great and serious danger, and which makes me feel that we are not yet ready for public ownership of railroads in this country, because that difficulty could only be overcome, I believe, through a state of public sentiment so earnest and so intelligent as to secure a complete enforcement of thorough civil-service rules.

This difficulty has been overcome in the republic of New Zealand, and to a large extent it has been overcome in the republics of Australia with the railroad, telegraph, and telephone systems. There is still some difficulty with it in Australia, and there is still necessity in New Zealand for careful watch, although they have very thorough civil-service rules, and they are well lived up to.

In Germany there has not been nearly so much trouble on this account, because they adopted a thorough civil-service system at the time they put the railroads into public hands, and the power of the Government has been such that the system has been excellently carried out.

In the English telegraph and post and other public services we have perhaps the very best example, or one of the best, of the thorough enforcement of good civil-service regulations, so that a change of party in Great Britain involves no change except that of forty-odd heads of departments who control the political policy of the Government, and there is no change of employees or subordinate officials whatever.

We have in this country in the post-office some civil-service rules in force to a certain very limited, and, I think, seriously defective, extent; and I am sorry to say there is a tendency just now toward retrogression. Nevertheless, it is simply a difficulty in the administration, which a thorough organization can overcome as has been proved by experience in other lands.

England is quite as democratic, on the whole, as America, in spite of the figurehead of the Crown. New Zealand is certainly fully as democratic as America, and they have solved this problem. We ought to be able to solve it also, and I think we can solve it at any time the people are aroused sufficiently to demand it.

Moreover, the transfer of great interests to public ownership in a community of reasonable civic interest and enlightenment creates one of the strongest influences tending to secure thorough civil-service regulations, because it makes the necessity and importance of such regulations so much greater that, if the people have any intelligence and civic patriotism at all, they will require honest and careful administration, and the wider and more important the public business is the more likely a really intelligent people is to demand good civil service.

It is a question of the degree of civilization of the people. If they are in the state of civilization that New York City is at the present time, large monopolies in the hands of the public are not proper, for the city has not yet shown itself capable of rising to the occasion. I hope and believe they will in the near future.

In England—take Glasgow and Birmingham—the increase of public ownership of great monopolies proved to be one of the most powerful forces moving toward the political purification of those cities, because the people were in a condition where the vast increase of interests awakened their civic patriotism to new effort. They said, "Look here, the business in the hands of public servants is getting so tremendously important it will not do to let this thing be run by a ring. We must see that it is run honestly and fairly, and we must rouse ourselves and go to the polls and vote for honest men." And they have done it, and it has purified those governments. The mayor of Birmingham some years ago wrote an article in one of our leading reviews in which he attributed a large part of the political development and purification of Birmingham to the increase of public ownership in that city.

PUBLIC OWNERSHIP OF THE GOVERNMENT ESSENTIAL TO REAL PUBLIC OWNERSHIP OF OTHER PUBLIC UTILITIES.

Q. (By Mr. A. L. HARRIS.) Should public ownership of public utilities become universal and controlled by the civil service, as you have just described, would not that build up an office class that would cause a great deal of unrest?—A. May I say just a word more about this other matter, and then deal with that. I want to add on the patronage point that, while we are considering this subject of the political aspects of public ownership, it seems to me very essential to note the difference between public ownership and Government ownership. The two are not the same, are not identical. For example, Russia has Government ownership of railroads, but she has no real public ownership, although the railroads are largely administered in the public interest. She has no real public ownership, because the people or the public does not own the Government. If the Government is a private monopoly, everything in the hands of the Government is a private monopoly. Philadelphia, they sometimes say, used to have public ownership and operation of the gas works, but from my studies of Philadelphia I do not think there was really public ownership of gas works there in any true sense, because the people did not own the councils; private monopolies owned the councils and not the people, as shown by the fact that councils refused to submit the question of leasing the works to a referendum. Mass meetings were held, and there were tremendous protests through the press. I think every paper in the city appealed to councils to submit the lease to the people to see whether they would vote for it or not, and the councils would not even do that. They would not allow the lease to go to the people on referendum.

Now, in the light of this distinction between public ownership and Government ownership, the argument I have been making about public ownership—while it applies in a certain degree to Government ownership, in proportion as Government ownership is real public ownership and not private—does not apply to the system

of Government ownership where the Government itself is really a private monopoly in the hands of a political ring or machine, so that the first and absolutely essential point to keep in view in considering public ownership is that the people must have public ownership of the Government, must own their councils and their legislatures, before they can hope to make a success of the public ownership of industrial monopolies. The Government itself is a monopoly and a public utility, and the doctrine of the public ownership of monopolies and public ownership of public utilities includes as its most important element the public ownership of the Government. Now, complete public ownership of the Government involves civil-service reform, and I think it involves also a system of direct nominations and direct legislation, so that the people can at all times control their representatives and their administrative officers; so that if they do what the people do not want, the people can call them down (just as we can stop our agent or architect if he attempts to act in our business in a way we do not approve), or if the representatives refuse to do what the people desire, the people can instruct or compel them to do as they wish, or enact the popular will into law at the polls in spite of councils and legislatures. That is a fundamental element in the philosophy of public ownership, the key to the whole situation.

AN OFFICE CLASS.

Now, your question was in regard to the building up of a great office class. I think that is a serious difficulty. At the same time, if this matter I have just been speaking of is duly regarded, there is nothing alarming about an office class. Those public servants under a fair system of civil service would be as free as the present servants of the great monopolists, and I think freer. They could vote as they chose. In fact, take the carriers in the post-office now. They do not vote all one way by any means. They are Democrats, Republicans, and Populists, Prohibitionists, Social Democrats, Union party men, and nonpartisans, and they are not discharged because of their political affiliations. Public employees are freer now as a rule than the employees of private corporations; and when the people really become aroused to the need for good civil service, public employees will be perfectly free to vote as they please. So long as they do their work well they will be sure of their places no matter what their politics may be, which is more than can be said of the employees of our private monopolies. New Zealand is our best example, perhaps. The English telegraph is very good; but the New Zealand railways and telegraphs and telephones treat their employees in such a way that they feel—the universal testimony is that they feel absolutely free, not merely to vote as they please, but to criticise their own Government. Every railway officer and employee has a vote in electing the appeal board or arbitration court that settles all questions between employees and the Government. It is a bit of real industrial democracy. Any employee who is discharged can appeal to the judicial tribunal to decide upon the justness of the dismissal, or if he is degraded, or his wages are changed, or if he is not treated rightly in any way, he can appeal to the board to determine the justice of the case. It is a court in full power, and the employees have far more liberty, both industrially and politically, than they have under our system of private monopoly. There is little or no tendency, so far as I am able to ascertain, either in the English telegraph or in the German public systems to exert even the slightest control over the politics or religion of employees. In New Zealand there is absolutely none.

Q. (By Mr. LITCHMAN.) Do you take into consideration in that analysis the contrast between the conditions in a new country like New Zealand and the conditions in our own country?—A. Yes; I admit that it would be more difficult in this country to organize and carry on a thoroughly good system, both because of its size and because it has got to running in ruts that are not in the right direction. But the problem can be solved on the same lines here as elsewhere. America is used to larger affairs than other countries, and her strength is greater than theirs, as well as her difficulties. Moreover, the size of our railway systems multiplies and intensifies the evils of private monopoly in transportation, magnifying the need of public ownership in even greater proportion than the difficulty of it. Everything is on a large scale—system, strength, need, difficulty.

Q. Now, doesn't that reach the point where you can consider the question which I asked this morning, that perhaps the greater extent of mileage and consequently vaster extent of the problem itself in America—.—A. (Interrupting). Would make it more difficult?

Q. Would tend to approach a question of impossibility?—A. No, I think not. The difficulties resulting from size do not really affect the question of public ownership as compared with private ownership in the same country, for those

difficulties apply to private roads as well as public. In any given country, whatever its size, if part of the people can own and operate a railway system, surely the whole people should be able to accomplish as much as a part of the people can. It would be a colossal undertaking, if we contemplated the taking of the railroad system, telegraph and telephone, etc., all at one gulp; it would be almost like a man trying to eat a dinner at one mouthful, but under any fairly arranged system of transfer, such as that organized in Prussia, for example, we would take one great line at a time, and organize that thoroughly on the basis of the present employees and officers, superintendents, managers, etc., as agents, to operate for a big body of stockholders, the whole people, instead of operating as at present for a small body of stockholders. That is the only difference so far as the operation is concerned. Now, then, if the big body of stockholders, the people, get sense enough—it is only a question of intelligence—get sense enough to make proper by-laws and regulations so that these agents will run the thing under reasonable conditions, I think they can run the system for the big body of stockholders just as intelligently and just as honestly as for a little body of stockholders—more honestly probable, for they would not be under the same temptation to make private concessions, rebates, etc., as they are now. Then, of course, there must be good civil service rules to prevent dismissals without cause; you would have to have that at the start. Then, after some experience with the one system, we can do as Prussia did, take others gradually, and we can give fair prices for the roads, I think, in the same way that Prussia did. We can say to the railroads, "estimate what you ought to have for your road, and if it is fair we will pay it, but we warn you to be fair, otherwise we will apply to you the principle of competition, which you admire so much, until you are ready to do what is fair." In that way Prussia bought her railroads for very reasonable value, fair to the owners and fair to the people. We could do something like that, although perhaps we could not get entirely satisfactory terms without a preliminary process of legislation to squeeze out some of the water in our railroad capital.

Q. How many railroad hands are there estimated to be in the United States?—A. Oh, I think something like 800,000 or over.

Q. Suppose that 800,000 people were under one party's control or management, which would naturally be the case with the appointments under whatever party was in power, how would you eliminate the sectional question which Mr. Kennedy asked you about this morning—preferences of section rates, or whatever may be given one section of the country against another?—A. I would deal with it in the same way that Germany has dealt with it—advisory councils and a national council representing and equalizing the pressure of interests from all sections. You can't get rid of the sectional question entirely, but you can go a long ways toward it by such a system. In the first place, I do not admit that the 800,000 employees would be under the political control of the party in power. I have clearly stated that civil-service rules controlling appointments, promotions, etc., on the merit system must be a part of any true system of public railways. Every appointment must be by merit or competitive test, and every employee discharged must have an appeal to an impartial tribunal to try his case. No appointments except for merit, and no discharges except for cause, and a public sentiment back of the law that will see it enforced. That is why I emphasize the necessity of strong public sentiment. Coming back to the sectional question, local directories and local advisory boards, representing the various interests of the locality, and sending their representatives to the national council would balance and harmonize sectional interests far better and deal with them far more justly in every way than they are dealt with by private railways. In that way, in Germany, through the discussions of these representative bodies, the counterbalancing influences of these representatives from different parts of the country, the railroad system is kept practically just and reasonable.

Q. Do you think that system of advisory boards would apply to a road 3,000 miles long?—A. Yes; or a hundred thousand.

Q. With the diversity of interests in different places?—A. No trouble about that; the local representative board expresses what its local interests require, and then it sends its representative to the national council, where State and sectional interests would reach a reasonable adjustment, as they do in Congress now, an adjustment in the light of publicity and after full discussion and investigation, instead of adjustment by the arbitrary will of a few railroad men, who decide in reference to their own private profit and not according to the interests of the section involved or of the country as a whole.

Q. Would not this system of civil service, as outlined by you, necessarily involve a system of pensioning?—A. Of old age pensioning?

Q. Yes.—A. Yes. I thoroughly believe in that. Old age insurance is a better name for it.

Q. Are you not doing exactly what Governor Harris asked about—establishing an aristocracy of officeholders?—A. I believe in pensioning or insuring *all* employees in the country, not only on railroads. A man who has worked honestly and industriously during his years of health and power is entitled to a reasonable sustenance in his old age. I see no aristocracy about giving old people the means of comfortable existence any more than it is creating an aristocracy to give little babies a comfortable subsistence.

Q. Is not this whole question of yours a direct creation of a special class of specially favored employees?—A. No, I think not, unless just treatment can be called favor. Public employees are more justly treated as a rule than the employees of private corporations, but they get no more than is fairly due to labor. But even if we waive the objection to the misleading element in the phrase and call them a "favored class," the difference is only temporary. They have come up nearer to the level on which all employees belong, and the rest will follow. Railroad employees will not be any more favored than other employees, provided the progress in other branches of industry keeps pace with the progress in the railroad system. We ought to have public ownership of other monopolies, and cooperative industry in other businesses that are not monopolistic, and if the progress in these other branches keeps pace as it ought to with the development of the railroad system, there would be no privileged class at all. At present I suppose the carriers, the regular employees of the post-office, are in one sense privileged, but that is inseparable from the fact that our civilization does not develop all at once all along the line, and I did not suppose it was an objection to the public post that it treated its employees better than street railway employees are treated, or the workers in our coal mines, or telegraph offices, or sweat shops. I supposed it was one of the strongest arguments in favor of public ownership, that it tends to the elevation of labor, better wages, shorter hours, sick relief, old age pensions, etc. If the creation of this sort of favor is a valid objection to public ownership, the objection applies to the post-office, fire service, police departments of our cities, and State and municipal employment in general.

Q. (By Mr. A. L. HARRIS.) Would there not be danger of this large army of officials banding together and demanding of legislators legislation especially in their favor?—A. Suppose we take 800,000 people. There are over 18,000,000 voters in the country, 16,000,000 or 17,000,000 that exercise their right. Now, can 800,000 people have their way against the majority of the people?—If that 800,000 people wished to accomplish anything that the rest of the people did not want them to accomplish they could not do it. The 800,000 railroad employees, even if a solid unit, could not win against a majority of the people—8,000,000 or 10,000,000 of voters. If they did win, it would be because they had a majority, and if they had a majority with them they ought to win.

Q. (By Mr. LITCHMAN.) Could they not accomplish it if the people were not willing but they were not so well organized?—A. That is simply a question of intelligence. It is not likely the railroad employees would have all the brains. Until the people are intelligent enough to unite to carry out their purposes we do not want—

Q. (Interrupting.) Do we not reach that result in the very examples you have given, where they do not have 800,000 people, yet they do manage?—A. They do it through the immense control of vast property and wealth. They have enormous private profits of their own to spend. How could that be applied to public ownership? You have no such power as that, and under civil-service rules there would be no offices to give. The English telegraph does not enable any officers or band of officers to control anything to speak of.

Q. It seems to me that you do not make clear the application of the theory which you recently had apparently clear as applied to a small undeveloped country, or to a highly developed country that is also small—you do not make that theory clear when applied to a vast extent of territory like our own, with its great diversity of industries and great diversity of thought and application.—A. Yes; but if it is a fact that the public system is a thorough success in New Zealand, under democratic organization, that the people are intelligent and wide-awake enough to look out for it there, then it is simply a question of solving the same sort of a problem under slightly more difficult circumstances on the same principles, on the same lines exactly—a little bigger problem. The same elements, the same principles, publicity, watchfulness, balancing of interests—if the people of each State watch the railroads as New Zealand does, then the business in that locality will go all right, and the representatives of the local organizations will adjust the interstate interests in the National Council.

Q. (By Mr. TOMPKINS.) Did you ever consider the proposition of having the public own the roadbeds and the corporations or individuals do the transportation business in competition, the same as is done by boats on rivers? It is the roadbed that is the monopoly.—A. Yes, I have considered that a little; but it does not appeal to me because it does not eliminate the element of antagonism of interest which I think lies at the bottom of the whole thing, and I do not believe either in the possibility of running the railroads on the principle of competition with good results. Competition means the building up of great cities, and of private individuals, and the system of discrimination would be kept up if private parties owned the business, no matter who owned the roadbed; and I do not believe we could solve the problem in that way in its most vital elements. Moreover, the practical difficulties of the sort of competition you speak of have been found to be insuperable. That was the theory of railway service in the early days, but it was found to be impracticable. Two lines of boats can pass each other on the river, but two companies can not operate trains on the same tracks; so that if two companies are to operate between New York and Washington, each company must have its tracks, and that causes a wasteful duplication, breaks up the business, weakens each company, and neither service is as good as it ought to be, and finally the two companies get tired of fighting and combine, and you lose even competitive rates and have to pay dividends on a double capitalization.

MEANING OF MONOPOLY.

Q. (By Mr. FARQUHAR.) You have used very frequently the word "monopoly," and I think it would be fair to this commission and to your whole address to have an exact definition?—A. I defined it exactly this morning.

Q. Let us have it again.—A. I define monopoly as any advantage which tends to shut out competition, whether it be a franchise, railroad rebate, or other privilege—a vast combination of wealth, the ownership of land, mines, or whatever it may be—any advantage that tends to shut out competition.

Q. Then all your plea is for public ownership of monopoly. Or, otherwise, it is socialized public service.—A. I should not confine my plea for public ownership to monopoly. I think there are cases like public schools and libraries, and fire departments, and so on, where there is no monopoly necessarily, where still the advantages of simplification, and the depth of public interest in the service, and the importance of entire diffusion, bringing the service within reach of the poor as well as the rich, and other considerations are so vital that public ownership is a necessity, without regard to the element of monopoly.

Q. Can you name a railroad in this country that is a monopoly?—A. Yes; every railroad is a monopoly. Every railroad has advantages in regard to its local traffic which tends to shut out competition in regard to that traffic.

Q. How is it with other industries—the carpet trade, the cotton trade, the iron trade? Where is your line of distinction on monopoly coming in there?—A. The same as before. If a concern has a grip on the market that tends to shut out competition, it is to that extent a monopoly.

Q. But you said, competition being eliminated it became a monopoly.—A. No; I said this: any advantage which tends to shut out competition, if it only shuts out a little competition, if it shuts it out partly. There is some competition in every monopoly. A gas plant has to compete with the electric-light plant, or with petroleum. Monopolies, as we ordinarily use the word, are businesses which have great advantages which tend to shut out competition; whereas a man who is manufacturing shoes, for example, in the ordinary way, has no monopoly—anybody with a little capital can go into shoe manufacturing and manufacture on equal terms with such a concern.

Q. But your own advocacy here of municipal ownership, State ownership, national ownership, governmental ownership, creates the greatest monopolies in the country, standing by your own definition.—A. Exactly; but I have no fault to find with public monopoly; the evil lies, not in public monopoly, but in private monopoly, that monopoly which is used for private interest instead of public interest.

Q. (By Mr. LITCHMAN.) The fault is not with monopoly, but private ownership of monopoly?—A. Exactly.

SCOPE OF PUBLIC OWNERSHIP.

Q. Will you suggest what lines of industry you would monopolize under public control, or control in the public interest?—A. I think that is to be decided step by step, going as fast as experience and the sentiment of the people and the evils

of great monopolies justify. Take first those monopolies which the people see ought to be taken, and make experiments step by step.

Q. Have you not in some measure thought that out far enough to give an expression?—A. I believe in the public ownership of the great monopolies, franchises, public utilities, natural monopolies, monopolies of essential services.

Q. Transportation and transmission of intelligence; you include those?—A. Yes; and gas and electric-light works.

Q. How about, for instance, fuel?—A. Well, as far as the commerce in fuel is concerned, I think that the principle of forcing organization of capital into the channels of voluntary cooperation will work, and I am in favor of trying to get capital and labor to organize in voluntary forms of cooperation. I think they have all got to come to cooperation, but I am in favor of trying to get it so far as possible through the channel of federation of voluntary cooperative groups.

Q. How would you apply that in a case like anthracite coal, for instance, where the entire body of coal is already in the control and ownership of capital?—A. The coal industry at its source in the mines is a natural monopoly of the first importance, and I say public ownership of coal mines.

Q. (By Mr. FARQUHAR.) Suppose that you take over the street railroad plants and bring them into municipal ownership, say, costing 3,000,000, how are you going to provide for that amount of money being taken off the tax list?—A. Provide for taxes out of the earnings of the road. I would not take the roads off the tax lists.

Q. Going to make the road earn taxes?—A. Just as it does now. I should not make any change in regard to that.

Q. How will you manage in the case of telephones, where you have probably 5,000 people using telephones in a city where there are 300,000 people, and families and hundreds of people who never use it at all shall have to pay for it under the municipal system?—A. I should not advocate their paying for it any more than they are paying for it now.

Q. Individuals pay for it now?—A. Exactly, and let the individuals pay for it then.

Q. You mean then the city should go into the telephone business?—A. Certainly, but the ones who use the telephone would pay for it, though it would not cost them as much as they pay now.

Q. So then make the political organization the owner of it, and charge rates accordingly; instead of individual or corporation ownership, you want the city to be a corporation?—A. In the case of the telephone I believe that either cooperative ownership or public ownership is perfectly practical, and if the city or town will organize an exchange it can be managed in the same way that public exchanges are managed in many European cities. The city or town may charge an entrance fee to help cover the first cost, and then a reasonable rent per year, which runs from a half to a third of what private companies charge in very many instances, and the system will still pay taxes on its own cost and interest. They can do it without charging any entrance fee, if they want to, by raising the construction money on bonds and paying off the bonds out of earnings. No damage will be done to anyone who does not want telephone service, but experience shows that when the rates are reduced, as they can be under public operation and ownership, to a reasonable figure, that a very great proportion of the people use the telephone, a far greater proportion than under the private system where rates are high. That is one of the greatest advantages of the public system.

Q. Practically, do you think your theories would work well, except with a thing of universal use in a community, like water?—A. Well, yes. There are two replies I should like to make to that. One is that the service, which does not seem universal now, often has that appearance, because it is under private ownership, and the rates are so high that the common people can not afford it. That is the case with the telephone service. The telephone service in European towns and in some of our own, where cooperative systems are operated, is practically a universal service—that is, it is used so largely by the people that it becomes a real public utility. The reason that the telephone is not a public utility in many of our towns is that the rates of the private companies are so high that they are practically prohibited to the masses of the people.

Q. (By Mr. LITCHMAN.) The theory is that there are a great many more letters sent at 2-cent postage than when it was at 25 cents?—A. Yes.

Q. And if there was public ownership in the transmission of intelligence by wire as there is now by post the cheaper service would produce larger use of it?—A. I think so. I think in its nature the communication of intelligence is a public utility, and that it would become practically universal if properly managed.

Q. Is not the success of your theory dependent—I would not say exclusively, but very largely—upon universal intelligence?—A. Certainly; I would state this: I do not believe that democracy in government is practical, except in a high state of civilization. I do not believe that democracy in industry is practical until a slightly higher civilization is reached; but I believe that that higher degree of intelligence has already been reached by our people to a large extent, and that they will attain the full intelligence which will make complete democracy in industry practical just as surely as the high degree of intelligence has been reached which makes political democracy practical.

EFFECT ON CHARACTER, HARMONY, CIVILIZATION.

I guess I will merely state these points in outline. I believe that the public system favors the development of high character and intelligence among the people to a greater extent than the private system, and thereby every step toward public ownership through these effects, and by eliminating conflict and mastery between man and man, developing sympathy, and giving labor fuller opportunities for education and development, tends to secure the very conditions of a further rational and practical advance into the field of public ownership, so the advance of public ownership is the cure of the conditions which make public ownership difficult. It is its own road builder, step by step. It does not come all at once; it is a growth like the life of a youth, each year preparing him for the fuller and more arduous life of the years to come.

Under the public system, therefore, summing up the points I have tried to make, civilization, as a whole, appears to me to be favored as to mobility, as to moral development, as to political purification, as to treatment of employees, as to coordination of industry, as to application of the cooperative principle, as to justice in the administration and making of rates, as to aim and the whole tendency of the system toward a public instead of a private purpose, every test of civilization points to a system of public operation of public utilities as the ideal.

As a consequence of such a system our science of society will become a unified whole instead of a severed system, as it is now. The old political economy is like the old astronomy. The old astronomy thought the world was stationary at the center of the universe, and looked at the stars and sun as things going round the earth; and the old political economy thought that material wealth was the center of all things human. The new astronomy knows that the earth is not the center, and stands off and looks at the world and gets its true relation to the sun and the stars and the moon; and the new economy knows that material wealth is not the real center of human life; it stands off and looks at it and gets its true relations to mind, soul, affections, government, ideals, and human development. The importance of this is apparent when we note that if your government says, "Democracy, power in the people," and your industry says, "Aristocracy, plutocracy, power in the few;" if your jurisprudence says "Justice," and your economy says, "Get rich;" if your ethics and your religion say, "Love, service, devotion," and your economy says, "Self-interest, conquest, mastery," there is civil war in your social science; and we can not have a unified, consistent body of thought and principles until we get rid of these contradictions, and coordinate our political economy, our government, and our jurisprudence with ethics, and make them all one harmonious system under the law of love and service.

(The commission took a recess till 10.45 a. m., January 5, 1901, at which time Mr. Parsons continued his testimony, as follows:)

THE GROWTH OF PUBLIC OWNERSHIP.

The WITNESS. The next point in order in my thought is the growth of public ownership and the development of sentiment in favor of it. I have already spoken to some extent of the development of public ownership of railways and of the fact that the two systems were tried in Belgium and Prussia, and Austria-Hungary, side by side, with results favorable to the public railways. I did not speak of the experience of Australasia. There they started with private systems, as they did also in Prussia, and they had the same experience that private systems were unsatisfactory, and have changed now in all the colonies of Australia and in New Zealand, so that almost the whole system is under public management. The South African Republics have State railroads, the Orange Free State taking the roads over in 1897. Cape Colony owns 2,000 out of 2,350 miles, and Natal owns all. So we find under all sorts of government—monarchical, constitutional, republican, or democratic to the last degree, as in New Zealand—this same tendency of the railroad system to be absorbed by the Government.

When we come to the telegraph and telephone the same thing is apparent. England tried the private telegraph system for over a quarter of a century, and after investigating fully the systems of public telegraph in other countries, decided to make her system public, and has tried that for 30 years with great success and with acknowledged superiority to the former private plan in the same country. With the telephone the French Government tried private concessions first, and finding the private operation unsatisfactory, took the telephones over and made them a public institution. England has followed the same path, making the telephone private first, and now it has taken over the trunk lines and is proceeding to absorb the exchanges. In Australasia—in some of the colonies—the first telephones were private, as in Victoria, and again the private system proved unsatisfactory, and the government decided to make the service public. Those are just a few illustrations from many.

If we look at waterworks and electric-light plants in our own country we find the movement very strong in the direction of public ownership. The number of public electric-light plants in the United States has risen from 1 in 1880 to about 400 now, while public water systems have increased from 1 in 16 in 1800 to 1,690 in 1896, or from about 6 per cent to about 53 per cent of the total. Of the 50 largest cities in the United States, 21 originally built and now own their waterworks, 20 have changed from private to public ownership, only 9 being now dependent on private companies for their supplies, and several of the 9 are considering a change to the public system. Fifty years ago the idea of public ownership of waterworks was vigorously combated and objections urged very similar to those now raised against public ownership of street railways and railroads. But in Massachusetts now 75 per cent of the waterworks are public; in Illinois, 78 per cent; Michigan, 81 per cent; Iowa, 82 per cent; Minnesota, 87 per cent; Nebraska, 88 per cent, etc., and public water supply is quite universally recognized to be the proper thing. Another half century will probably see as great a change in sentiment and practice in the field of transportation.

The street railway movement in Great Britain is one of the most interesting examples. In 1882 there was only 1 municipality—Huddersfield. From 1893 to 1895 4 municipalities took over street railway systems—tramways, as they call them—and from 1896 to 1898 11 municipalities, including Liverpool and 1 line in London, came under public management, and now there are 30 cities in Great Britain owning and operating their tramways. The movement is still very strong, and as fast as the concessions to private companies expire the municipalities are making arrangements to take over the lines, so great has been the success and benefit of public ownership, as proved by actual experience where the two systems have been run side by side in the same country. It is because of the superiority of the public system, proved by such experience, that this movement has grown with such vigor as I have mentioned. There appears to be, in fact, an irresistible sweep of events toward public ownership of municipal monopolies especially. And when we turn to the matter of public sentiment, which I will not dwell upon, but simply call brief attention to, the movement of thought is even more remarkable than the movement of events, promising for the future a continuance in a still more emphatic degree of the change to the public system. I have here a circular, which gives a list of members of the National League for Promoting the Public Ownership of Monopolies,¹ and if you will glance over the

THE N. P. O. LEAGUE, OR NATIONAL LEAGUE FOR PROMOTING THE PUBLIC OWNERSHIP OF MONOPOLIES.

names you will see that many of them carry much weight, such as Dr. Edward Everett Hale; Dr. Charles B. Spahr, New York; Col. Thomas Wentworth Higginson, Cambridge; William Dean Howells, New York; Mary A. Livermore, Melrose, Mass., and so on. Miss Jane Addams has since withdrawn, on account of having so much to do that she did not feel able to give attention to the matter.

Q. (By Mr. PHILLIPS.) What is the address of the league's headquarters?—A. The headquarters is at No. 11 St. James Avenue, Boston; my own address.

The league was organized a few years ago for the purpose of ascertaining, through referendum votes, from time to time, the opinion of leading men on various questions that might arise in respect to public ownership, and of publishing the opinions adopted by a referendum vote. This league has adopted, by referendum vote, a number of statements on the subject, which have been sent out quite widely over the country, and if the commission would like them, I can leave them. I have here a few samples of the work that the league has done.¹

Q. Are they on the specific subject of monopoly, or railroads, or telephone, or telegraph?—A. Some on railroads, some on monopoly. We have no circulars on the telegraph or telephone as yet.

Q. These are bulletins of your league?—A. Yes, some of the bulletins adopted by referendum vote and then issued, and there has been no adverse vote, so far as I recollect, on any of these circulars. One slight qualification from Col. Thomas Wentworth Higginson on one of the bulletins, which qualification was adopted.

I would like to emphasize the important fact of the movement of thought and events toward public ownership in this way. There was a time, not so very remote in history, when the fire service was private. Now it is almost universally public, or very largely so. There was a time when the school system was private. Now it is almost wholly public. There was a time when even the common roads were private, and further back still there was a time when the administration of justice and the matter of defense were private affairs. If a man's rights were infringed, he had to look to himself or the voluntary assistance of his friends for redress. Now all these matters have been made subject to public ownership and operation.

a Deceased since joining the league.

If the principle of public ownership and operation of public utilities is a right principle, then it seems to me we should carry it wherever the reasons apply—wherever the reasons which have caused the growth of public ownership apply to new fields of enterprise. And vice versa, if the principle is not a right one as applied to monopolies and utilities like railroads and telegraphs, telephones, street railways, and so on, then consistency would compel us to go back to primitive times and give the courts and armies and navies over to private syndicates and schools to private combines, and so on. I see no escape from the logic of the past, no escape from the adoption of public ownership in other fields which are similar to those already covered by that system and to which the same reasons apply, the essentials being the vital interest of the public, the importance of diffusion—bringing the service within the reach of all the people, the element of monopoly causing great abuses in private hands when linked with large power—and the necessity for simplification, coordination, unity, and broad cooperation throughout the industrial activities of society—all this being continually held subordinate to the fundamental purpose of the development of mind and character and social institutions to the highest forms conceivable, in which conflict and antagonism shall be so far as possible eliminated, and harmony and mutual service, cooperation for the benefit of all concerned, shall be the dominant ideal and the realized fact.

Before passing to objections, I would like to introduce as part of my testimony an analytic summary of the railroad question.

SUMMARY.

Stating briefly the difficulties with private railways already spoken of and some others not yet mentioned, and placing in a parallel column the advantages of national ownership of railways, we have the following summary:

Difficulties with private railways.

1. Wrong aim: Private profit in place of the public good, dollars and cents instead of social service, dividends for a few instead of benefit for all, mastery and money instead of partnership and manhood.
2. Antagonism of interest between the owners and the public.
3. Lack of due coordination or else a consolidation too vast and powerful to be safe in private hands; a giant monopoly overriding and defying the regulative power of government.
4. An economic waste of hundreds of millions a year.
5. Watered stock and inflated capital, about half the capitalization of our railroads being fictitious, according to Poor and other high authorities.
6. No effort to free transportation from capital charges by the progressive cancellation of bonded or other indebtedness, but, on the contrary, a progressive piling up of capital without even the writing off of depreciation. As to the stock capital, a private road could not be expected to clear that off, since the owners can not be expected to give the road to the public as a present.
7. Higher charges than need be; an effort to obtain all the traffic will bear.

Advantages of public railways.

1. True aim: Service and the public interest first; financial gain subordinate to justice and social welfare.
2. Harmony of interest by making the owners and the public one and the same.
3. Full coordination with entire safety to the public, because the combination belongs to the public, and, with a few simple safeguards, is easily held to the public interest.
4. An economic saving of hundreds of millions a year.
5. No inflation of capital, but, on the contrary, an effort to get rid of the wind and water in the capital of purchased lines.
6. The progressive cancellation of the whole capital, so that transportation may be freed from the burden of interest and dividend charges.
7. Lower charges than private roads can make under the same conditions, and a definite policy of reducing rates as one of the leading objects of the administration.
8. Steady and uniform rates favoring honest provision and cutting the ground from under speculation.

8. Fluctuating and chaotic rates favoring speculation, but throwing honest provision off its hinges.

F. PARSONS.—PRIVATE AND PUBLIC OWNERSHIP CONTRASTED. 171

9. Unjust discrimination between persons, places, and industries. Free passes, secret rebates, differential preferences, etc.

10. Excessive reduction of rates at competitive points and overcharges on local traffic, to the injury of country districts and the overrapid growth of the cities.

11. No effort to relieve the pressure in the tenement districts of the great cities.

12. Defiance of law when it interferes with powerful railroad interests.

13. Purchase of legislation when practicable and useful to railroad interests.

14. Building and sustaining other monopolies and trusts, by privileges that enable them to control the markets.

15. Creating millionaires and disturbing the fair distribution of wealth.

16. A cause, at times, of industrial disturbance and depression and even panic.

17. Gambling in railway stocks and manipulation of their value by seesawing traffic, withholding dividends, or paying unearned profits, etc.

18. Exorbitant salaries for managers, with long hours, low wages, black listing, and other unfair treatment for ordinary employees, and disturbance of industry by periodic strikes.

19. Insufficient regard to safety of employees, passengers, and the public.

20. Imperfect coordination with the military department in time of war.

21. Injury to political honesty and good government through railway lobbies and the corrupting pressure of enormous private interests.

22. Great opportunity for success by fraud and indirection. (Read *Wealth against the Commonwealth*.)

23. Moral debasement of business men and degradation of the ideals of youth, through the spectacle of enormous wealth and power secured by railway rebates, manipulations of stock, fraudulent issues, and dishonest political action under railway pressure.

24. The payment of public moneys and gift of public lands to build railroads to be owned by private corporations and managed for their profit. The land and money, for instance, bestowed on the Illinois Central was enough to build and equip the whole road and give the company a bonus of \$2,000,000 besides.

9. Fair and impartial treatment of individuals; no secret rebates, passes only to those who render an equivalent in public service; equal rights to places and industries under the broad principles of the zone tariff or other equitable system.

10. Due concessions to through traffic, but earnest attention also to the reduction of local rates to give the small towns and rural districts their fair share of the advantages of cheap transportation.

11. A wise use of the roads to relieve the pressure of population and secure a healthful distribution of the people.

12. Conformity to law; the railroads and the lawmaking power being in the same hands.

13. No motive or power in public roads to purchase legislation.

14. An important means of controlling the organization of capital, by refusing transportation to objectionable combines, instead of giving them secret rebates.

15. A powerful means of securing a better diffusion of wealth.

16. A means of regulating industry, relieving depression, and avoiding panic.

17. Removal of railway-stock gambling and manipulation.

18. Moderate salaries for managers, and altogether better treatment of ordinary employees, higher wages, shorter hours, more good homes, better citizenship, more contented and efficient labor, no strikes.

19. Better provision for the safety of employees, passengers, and the public.

20. An added source of strength in time of war.

21. Removal of one of the greatest sources of political corruption without incurring new danger if reasonable precautions are taken in respect to civil-service rules and nonpartisan management.

22. No opportunities for private fortune by fraud if a proper system of accounting and auditing is established. (Read the *History of State Railroads*.)

23. Removal of one prolific and all-pervading influence tending to moral debasement and low ideals.

24. When public money and land is devoted to building a public road the road belongs to the people who pay for it and the profits go into the public treasury.

25. Public administration of railways means the retention of sovereign power in the hands of the Government, where it belongs; the "public control of public highways;" the public performance of a "public function;" the due enforcement of the tariff; the national regulation of commerce; an added justice, peace, and safety to industry, and an escape from one form of taxation without representation.

25. Private railways mean sovereign power in private hands—not only the sovereign power of modifying or nullifying the tariffs on imports, but the sovereign power to regulate commerce between our cities and States, to determine the distribution of wealth, the success or failure of individuals, the growth of cities, the development of the country, the life or death of industries, the power to tax the people without representation and for private purposes.

OBJECTIONS.

Now for the objections: First, the matter of patronage was spoken of yesterday, but there is one point more I would like to make. The transfer of great industries to public operation does undoubtedly increase the temptations to abuse of patronage. At the same time it creates in a still greater degree, I think, a powerful force opposed to that abuse. Under the private system the financial interests of the wealthy and influential classes are very largely opposed to good government, and it is this opposition of the financial interests of the wealthy classes (the owners of these monopolies) to honest government that is responsible for a large part of the corrupt legislation and bad administration that afflict our politics to-day. As Mayor Swift, of Chicago, said in speaking to an audience of business men. "Who is it that is corrupting the council? It is you business men. It is not the saloons or the slums of the city, the riff-raff or the hoodlums, it is you business men who are responsible for the corruption of councils." Now, the transfer of the great utilities to public ownership changes the financial interest of the wealthy, the great owners of property on this matter, so that it becomes their interest in common with the rest of the people that the Government controlling these great industries should be honestly and fairly administered. They no longer have a financial interest in the abuse of legislation or the abuse of governmental power of any kind. Their interest is strongly opposed to abuse of patronage. Their interest is wholly for good administration, for pure government in every way, or low cost and first-class service, and their interest is usually the controlling factor in the Government. So that the transfer of the great monopolies to public ownership means the transfer of a controlling influence in political affairs from the side of dishonest government to the side of honest government.

EFFICIENCY.

The objection is made that public management is not efficient, and I think the objection is made with great force in many cases. At the same time a review of public ownership in practice, both in the railroad, telegraph, telephone, street railways, etc., in other countries and in the electric-light systems in this country and the waterworks, indicates that the question of efficiency is rather a matter controlled by individual factors and the condition of society than by the form of ownership. Private industries as well as public are less efficient in Germany—that is, it takes more labor to yield a given product: a bricklayer lays fewer bricks in a day than our bricklayers do, and so the same thing occurs there in private industry that occurs in the railroads and the telegraphs where they have to have more employees for a given amount of work.

Again, part of the difference in the product per worker is not really a difference in efficiency, but arises from the fact that public systems give their employees shorter hours. That is true in the contrast between our railroad system and the German. The hours are very much shorter for large classes of employees in the German system than they are here. The same contrast exists between the English telegraph and our telegraph, their hours are very much shorter.

Then there is another difference. They regard safety as of such high importance in Germany that they increase the force of employees upon the roads in order to secure greater safety. These elements must be taken into account when considering the difference in the number of employees, which is greater per ton handled over there and per passenger than it is here. I do not feel able to draw any precise conclusion on the subject, I only indicate the elements.

ECONOMY.

Now, as to economy, which is a very important matter, two points are made. First, it is affirmed that rates are lower under private ownership than under public, our average freight rate being cited as an example; and secondly, it is said that absolute economy, absolute cost, is lower under private ownership.

I have already covered these points with sufficient fullness, perhaps, but I would like to emphasize a few illustrations of the principles that I dealt with yesterday. Take for example the Austria-Hungarian system of railways. The Government there introduced a tariff at one stroke that on long distances was 80 per cent below the former rates and on median distances about 40 per cent below—a reduction that astonished the railroad men of the world—and yet it has been a very great success and has justified itself not only in its social results, vast increase of traffic, and all civilizing influences, but it has also justified itself financially, the expenses not increasing materially—nothing like in proportion to the increase in business—and the net earnings being larger than they were under the high rates.

The English telegraph reduced rates at once one-third to one-half on taking over the lines, and subsequently made a further reduction amounting to one-half, down to the present time. So that about four times as much telegraph service can be bought for a dollar as could be bought when the lines were taken over, while in this country not over twice as much. There is a conflict in the reports of the Western Union Company. In their earlier reports they stated the average cost and average receipts for the earlier years lower than the more recent reports state the cost and receipts for the same years, so it is a little difficult to tell which account is right. But taking their highest figures, there is no such reduction here as there has been in Great Britain.

THE TELEPHONE.

I have already stated the facts regarding the reduction of telephone rates in France when the Government took the lines.

I took pains last night to get a few facts in regard to the Washington telephone system. I called up "Central" and got the exchange rates here and the rates for long-distance work; and the rates here in Washington, they say, are \$96 for residence, unlimited service, \$48 for four party, unlimited, and \$36 for four party, measured. For a business 'phone, \$120, recently reduced from \$135. They declare that they would lose money on a residence rate of \$36. The fact is, however, that the cost of operating a telephone in this country is not very much greater than it is in foreign countries, because, while wages in general are higher here, telephone wages are very little, if any, higher. Telephone girls receive abominably low wages, and the contrast is very slight there, while materials cost more in Europe than here, good Swedish telephones costing \$14 to \$16, while the best American instruments can be bought for \$8 or \$9.

Now, here is Stockholm, with a population of 290,000 (about the same size as Washington), which has metallic circuit, underground wires, unlimited service, \$16 for residence and \$22 for business, interurban communication free within a radius of 43 miles, telephoning telegrams and telephoning messages to be written down and delivered by messenger at low cost. The Bell Company, bought out by the Government, was charging \$44 for far inferior service, without metallic circuit or underground wires.

A United States Government department here in Washington—the Department of the Interior—a few years ago (1894) were paying a total of \$75 per 'phone. They paid the Bell Company \$80 to \$125 per 'phone and employed a lady at \$600 a year to operate the main exchange, making a total cost of \$75 per year for each of the 65 'phones. The Department asked the Bell to reduce rates and the Bell refused. They then put in their own 'phones, and they gave me the figures from the books of the Department, showing that the cost per year was \$6.43 operating cost and \$10.25 total cost, including interest, depreciation, and repairs—about \$10 for what used to cost \$75 under the Bell régime—the cost under private ownership being sevenfold more than under public ownership.

Q. (By Mr. PHILLIPS.) That is here in this city?—A. Yes; that is right here. Among the most interesting facts that I have on the telephone are those relating to Trondhjem, a city of 30,000 inhabitants in Norway. There they have a municipal telephone system which gives rates of \$16 for business and \$8 for residence, in round numbers, and they make a profit, a fair profit, upon the capital invested. The wages, however, are slightly lower than they are in this country, but not very much. In Grand Rapids, Wis., there is a cooperative telephone—

Q. (By Mr. CLARKE, interrupting.) You mean Wisconsin or Michigan?—A. Wisconsin. There is a cooperative telephone there which operates on the same principles as the public system, namely, for the benefit of all who are concerned in the service—and wherever the voluntary cooperative plan is possible, I believe it is preferable even to the public system in the present state of our civilization, so that I regard this example as one of the finest that we have. I have kept track of the enterprise for several years. Here is a letter just received a week or so ago. The present condition of things, in brief, is this: They have about 800 lines; the average cost is \$43 construction; the cost of maintenance and operation is about 75 cents a month for each line. The prima facie charges are \$1 a month for a residence and \$2.25 for a business telephone per month. Each subscriber has a right to take 1 share of stock and is urged to do so, \$50 per share, and nearly all, over four-fifths, do take one share each. One and one-half per cent dividends per month are paid back upon these shares, amounting to 75 cents for each shareholder. So that the actual charge for a residence phone is 25 cents a month and the actual charge for a business phone is \$1.50 a month. The actual cost to the subscriber is \$3 a year for a residence phone and \$18 a year for a business phone. They are continually reducing their rates, and even after paying these dividends they have a surplus fund for improvements. The former Bell Company was charging \$36 a year for a residence phone and \$48 for a business phone, and refused to reduce their rates. They said, just as they say now in Washington, that they could not afford to reduce rates. Yet the people of Grand Rapids are now receiving telephone service at one-third to one-twelfth of the former monopoly rates.

Now, as to distance charges. Philadelphia is 137 miles from Washington. The charge, the day charge, is \$1.25—and I would say that in this country and also in France and several of the other European countries they have half rates at night; I will simply compare the day rates. To Philadelphia, 137 miles, day rate \$1.25, 5 minutes. In England the rate would be 48 cents, in France 30 cents, according to their published tariffs. They have a distance rate in France of 10 cents for 82 miles and in England 6 cents (3 pence) for the first 20 miles—any town within 20 miles—and 12 cents (or 6 pence) for towns within 40 miles, and 12 cents for each 40 miles afterwards. New York is 228 miles from here, and the charge is \$2. In England it would be 72 cents and in France 40. Boston is 417 miles away, so the railroad folks say—I have taken the miles from the railroads and the prices from the telephone—the telephone rate is \$4. In England it would be \$1.30 and in France 70 cents. Chicago, 716 miles; the rate is \$4.25, England \$2.16, France \$1.20. Richmond is 116 miles away; our rate is 75 cents, England 30 cents, France 20 cents. New Orleans is 1,116 miles; our rate is \$6.35, England \$3.16, France \$1.90. We have here three tariffs, all made on the distance plan, the American being a private system and the English and French public systems. The English distance tariff is from one-half to one-third of ours and the French from one-third to one-sixth of ours. I have tested that with many more data than these. I simply give these as illustrations that are applicable right here in Washington. In Boston you must pay 10 cents to send your breath a few blocks over a telephone wire, while the street railway will carry your whole body all over the city for a nickel, and even that is known to be nearly double the reasonable fare. In the State systems of Europe the charge for a local telephone conversation to a nonsubscriber is from 2 to 5 cents, as against a charge of 10 to 15 cents in many of our cities.

The service of the telephone in other countries where the system is public is far superior in its coordination with the post-office and telegraph. You can telephone letters; you can telephone messages to be written down and sent by messenger just as telegraph messages would be; you can telephone telegrams without going out of your house. To a very slight extent, I found in Philadelphia and other cities, you can get service for telephoning telegrams, but it is only by special arrangement, the ordinary telegraph rules in our cities being against the receipt of telegrams by telephone. The telegraph company does not want to make telephoning too interesting, and they prefer to have the message in the sender's writing, so they refrain from making such agreements very accessible. No such coordination of services can be expected between two private corporations like our telegraph and telephone companies, as occurs where both services are public property under a single management.

Q. (By Mr. FARQUHAR.) Can you give a comparison of what the Washington companies here could afford to furnish this telephone service at?—A. The matter has been quite carefully investigated by expert engineers in New York, Chicago, and Boston. I am personally acquainted with one of the men, who is president

of a company that is putting a large amount of capital into a telephone concern in and around Boston—Mr. Holbrook, of the Bibliotheca Sacra, a very fine man and thoroughly acquainted with all the details of this work. They find they can construct the lines for \$40 or \$50 in small places and \$100 to \$150 in large cities, with underground work—an average cost of about \$60 to \$80, or—

Q. (By Mr. PHILLIPS, interrupting.) Eighty dollars per mile?—A. No; for the average cost of line to each subscriber; some will be long and some short. You see that is a little higher than the Grand Rapids; their cost was \$42. They can operate the telephone so as to be able to furnish service even in a large city at about \$30 a year. Offers have been made in Chicago, if they could get a franchise, to supply telephone service for \$30. A similar offer has been made in New York. And in and around Boston Mr. Holbrook's Massachusetts Telephone Company is putting in 'phones and operating them on the basis of \$3 a hundred calls or \$12 to \$36 for an ordinary residence subscriber, up to \$72 for unlimited business service, with underground wires in the heart of a giant city—rates that will work out an average considerably below \$50, since the New England Bell rates, which are about double the Holbrook rates, work out to an average of \$58 per 'phone. Mr. Holbrook's data indicate that Bell monopoly rates are more than double what the system can be operated for either in the towns or in the large cities, even considering the fact that the larger the city, other things being equal, the higher must be the rate for the telephone—exactly the opposite principle that applies to most services. The more dense the business in the case of the electric light the lower should be the charge, other things equal; but the more dense the business in a telephone exchange the higher must be the charge, other things being equal, because more complicated arrangements must be made to connect the different subscribers. That is, if you have 10,000 subscribers, each one may call for communication with any one of nearly 10,000 others; whereas if you have only 1,000 subscribers, each one is limited in his calls to 999; so it is more complex and more costly with a large system. In small places an average charge of \$8 to \$12 or \$15 a year, according to conditions of the locality, is sufficient, and those charges are actually in successful operation in various parts of the country. There is a small telephone system, private system, in Kansas which operates and makes a profit of 10 or 12 per cent on the capital, and their rates only average about \$12 or \$15 per year on their phones. The fair cost of maintenance and operation runs from \$9 to \$12 per 'phone in an exchange of moderate size, and double that in a big city.

Q. (By Mr. FARQUHAR.) Would the matter of the Washington prices here be in some way modified on account of the fact that all of our telephone wires are underground, but if they were put overhead—A. (Interrupting.) In Stockholm also the wires are underground.

Q. So that the extra cost of the installation underground does not make a greater cost there for the use of the 'phone?—A. It adds something to the first cost, but the system needs less repairs, and in the end the result is not very different.

I might mention one or two facts as to the service in the public systems. In Belgium you can send your telegrams free; in France you can also send telegrams free. In England also you can send telegrams free over the telephone, and you can also telephone messages to be sent out for 6 cents in England, and such messages are sent to the subscriber free. In Germany it costs 2 cents plus one-fifth of a cent for each word to telephone a message, telephone a telegram, or telephone a letter. You go to your telephone and send a letter for 2 cents and one-fifth of a cent for each word, and the clerk at the other end writes it down and posts the letter; you have to pay postage in addition.

Q. (By Mr. PHILLIPS.) Now, it may not be quite clear about telephoning a message. What do you mean by telephoning a message?—A. Suppose I want to send a message to someone. I do not have a telegraph office in my house, but I have a telephone. I will go to my phone and telephone whatever message I want to send. Instead of having to go out to a telegraph office and write it, I simply go to a telephone and telephone to the clerk at the other end that message; he takes it down and sends it by messenger to the person to whom it is addressed, or he sends it to a telegraph office and it is sent by telegraph, or he telephones it to the telegraph office directly, or I can be connected directly with the telegraph office and they write it down there and send it at once.

Q. (By Mr. FARQUHAR.) Would it be possible in this city, Professor, to furnish a phone, house or business, say for \$30 or \$35, unlimited?—A. I think so; yes. One of the reasons why the Bell companies think they can not furnish service at such rates is the state of their capitalization. The water in their system is hard

to deal with. Dropsy is an inconvenient affliction for a company as well as for a man. For example, the New England Telephone Company (operating in Boston and other cities and towns of Massachusetts and New England) is capitalized at more than \$300 a line, whereas President Holbrook finds that the system could be duplicated for less than \$100 a line—there is an excess charge of \$10 or \$12 per phone year. Then the "general expenses," salaries of managers and officers, and other office and general expenses amount to a sum almost as great as the whole sum put down to "operating expenses" proper. For each subscriber's station in the New England Company, the average receipts are \$58 per phone year. At least \$10 must be deducted on account of overcapitalization, and \$5 or \$6 more on account of excessive office charges. The "operating expenses" proper are stated at about \$11 per station and maintenance at \$24. The report does not state just what items go to make up this maintenance account, and it is so out of proportion to the cost of maintenance in public systems as to indicate that it is affected by the common corporation custom of charging up to maintenance large amounts that ought to go into the extension and improvement account. A maintenance charge that would duplicate the entire system in about 4 years is certainly very high. The probabilities are that an allowance of \$11 for average operating expenses per phone year, \$4 for general expenses, \$15 for maintenance, including depreciation, and \$5 for interest, making a total of \$35 per year, constitute sufficient charges even in a very large city.

I am aware that in *Manning v. Chesapeake and Potomac Telephone Company* (28 Wash. Law Rep., 97) the supreme court of the District of Columbia has held unconstitutional an act of Congress fixing maximum telephone charges in Washington at \$50 a year with 1 telephone on a wire, \$40 with 2 telephones on a wire, \$30 with 3 telephones on a wire, and \$25 with 4 or more on the same wire (30 Stat. L., 537, 538, chap. 540, June 30, 1898), but a careful reading discloses sufficient evidence on the face of the opinion to invalidate the decision when the case comes before the court of last resort, the supreme court of public opinion. The ground of decision was that the rates fixed by Congress were unreasonably low, the evidence being the testimony and accounts of the Chesapeake and Potomac Telephone Company, doing business in Washington. In 1898 the company had a little over 2,000 telephones in use. It had been receiving \$135 for a business phone, and had averaged \$100 income for every phone in use. It was estimated that the new law would reduce the average receipts to \$47 per phone. The company was paying about \$20 per phone in interest and dividends, and \$8.50 per phone to the Bell Telephone Company and the Western Electric for receivers and transmitters used by subscribers, drops on the switchboard in the central office, and the use of patents the Bell Company may hereafter acquire. It claimed an average annual working expense of \$71.20 per phone. The capitalization was \$470 per phone (\$100 bonds and \$370 stock).

Now let us look at these items in the light of other facts stated in the opinion. The actual value of the plant was found to be \$441,436 as against \$950,000 capitalization, or less than \$220 real capital per phone, instead of the \$470 of existing stock and bonds, making the fair capital charge not over \$10 per phone, instead of \$20. But, further, a very large part of the \$220 was due to the fact that the plant was not used anywhere near up to its capacity, and this in turn was probably due to the high rates maintained by the company. A large part of the capital outlay was for underground construction, putting in vitrified terra cotta ducts under asphalt pavements. The court said that "the cost of additional ducts to provide for future growth of business is very trifling, and it is in evidence that some 3,000 or 4,000 subscribers could be served by cables to be drawn in the vacant ducts now maintained;" that is, the business could be doubled or trebled without more ducts, and even further increase could be provided for at trifling expense. If the rates enacted by Congress had been put in operation, the subscription lists would doubtless have expanded greatly, and it is quite probable that the real capital per phone would have been speedily reduced to the neighborhood of \$100, or \$150 at most, in spite of the fact that Washington is a "city of magnificent distances." I know the judge doubted any substantial increase of subscribers through lower rates, but the facts prove that the doubt was not well based. The following table presents a few of the facts bearing on the relation between rates and the use of the telephone:

	Relative size.	Rates.	Number of persons to 1 telephone.
Washington (1896)	1	\$36 to \$135; \$100 average.	120
Stockholm ¹	1	\$20 average	28
Christiania ¹	$\frac{1}{2}$	\$22 average	30
Trondhjem ¹	$\frac{1}{2}$	\$18 average	38
Berne ¹	$\frac{1}{2}$	\$10 upward	40
Zurich ¹	$\frac{1}{2}$	\$10 upward	50
Berlin ¹	7	\$36	60
Copenhagen	$1\frac{1}{2}$	\$41	70
Amsterdam	2	\$50 to \$100	150
Paris ¹	10	\$75	170
Greater London	22	\$100	700
Greater Boston	4	\$25 to \$150	60
Greater New York	13	\$90 to \$240	120
Chicago	6	\$60 to \$175	180
Philadelphia	5	\$60 to \$250	170

¹ These cities have public systems, the others have private plants. The American figures relate to 1897 and 1898, the year of the Washington discussion. The European figures are a little earlier and therefore probably less favorable to them, as the use of the telephone grows each year. In the column of size, Washington has been taken as the unit and the other cities classed according to their relative size as compared with Washington; Zurich, half the size of Washington; Copenhagen, one and a third times as large as Washington; Philadelphia five times as large, etc.

The evidence is that low charges, whether in cities larger or smaller or the same size as Washington, induce far larger use of the telephone than exists in Washington, such larger use being found as an accompaniment of low rates in cities of vastly less general intelligence and prosperity than Washington, and in cities having private plants as well as those having public systems; whereas in foreign cities, like Amsterdam, Paris, and London, having high charges (though only one as high as Washington) show a lower use of the telephone than Washington, and the same is true of American Bell cities, excepting Boston, which, being the hub not only of the universe but of the telephone business, and a city of great prosperity and unsurpassed intelligence, naturally breaks the record.

In Rochester, N. Y., a city of 163,000 people, or about three-fifths the size of Washington, there is an independent telephone company with rates of \$30 and \$48, on which 8 per cent dividends are made on a large body of stock, all of which is water, as the bonds more than cover the value of the plant. With these rates, which are still too high, there is one subscriber in Rochester to each 40 persons, showing that with anything approaching reasonable rates our people become large users of the telephone.

Upon the facts here stated and the whole body of existing telephone data, there is the strongest reason to believe that lowering the rates to the Congressional level of \$25 to \$50 would very largely increase the number of subscribers, probably doubling the use of the telephone, and perhaps trebling it within 2 or 3 years. The judge said that the court must take "care not to intrench upon the authority of the law-making power, not to disregard the statute under consideration, unless it be *unmistakably* repugnant to the fundamental law." Yet the court refused to consider the case on the basis of the probable increase of business and decided it upon facts relating to the preceding years under high rates. Suppose the law in Hungary establishing the zone system, reducing rates 40 to 80 per cent, had applied to a private system of railways instead of a public system, and the railroads had brought the matter into court, claiming that the law confiscated their property, saying that since they had only been making ordinary interest on their capital at the old rates, they would surely make a loss on the new tariff averaging less than half the old one. The companies would have made out their case on the basis of existing rates and business, and the law would have been declared unconstitutional on the principle of this Washington decision, and yet the law was so far from being *unmistakably* repugnant to the fundamental law against confiscation that the actual result of putting the law in operation was an increase of net earnings instead of a loss, as had been expected. It is not possible to foresee the effect of such a lowering of rates either in the railroad or the telephone field, wherefore the court can not know that such a law as that relating to the Washington telephone is "*unmistakably*" repugnant to the Constitution. The true plan in such a case is to enforce the law for a reasonable time, until it becomes clear that the effect of the law is to deprive the company of a reasonable return—clear as a matter of fact and not as a matter of supposition or inference from

more or less irrelevant data. Then the law may rightly be declared unconstitutional, and the company should have the right to collect from the Government whatever damages have been inflicted upon it by the said enforcement, but if upon fair and honest trial the law justifies itself, it should be continued in force.

In the Wellman case (143 U. S., 839) the Supreme Court of the United States clearly recognized the principle that the increase of business from lowered rates must be taken into account, and made this principle one ground for refusing to hold void a railway law of Michigan fixing maximum passenger rates at 2 cents a mile. In Indiana a statute fixing the rent of a telephone at not over \$3 a month, or \$36 a year, has been held valid, although the company in suit was charging \$11.16 a month, or \$134 a year, and claimed it was only making reasonable profits and could not manage on \$36 a year.

To return to the Washington items. It is probable that the enforcement of the Congressional rates would double or treble the business and bring the real capital per phone down to \$100 or near it, thereby reducing capital charges from \$20 to \$5 or \$6 per phone.

The \$8.50 monopoly tribute to the Bell and Western Electric is almost wholly an unjustifiable charge under an agreement made years ago under pressure of the fact that the Washington company, like those in most other American cities, are really subsidiary Bell interests, or branches of one big monopoly.

The claim of \$71 per phone for working expenses is absurd in my judgment. Compare it with the working expenses of \$6.43 reported in this same city of Washington for the telephones of the widely scattered buildings connected with the Interior Department's exchange above mentioned, and the difference makes the \$71 claim incredible. Remember that this same private telephone interest which now claims it can not reduce rates because its \$100 of average receipts is only just enough to cover cost of working and capital charges made a similar claim when the Department of the Interior asked for reduction 6 years ago, and yet when the Government put in its own phones the service cost only \$10.25 for maintenance, operating cost, depreciation, and interest, in place of \$75 per phone formerly paid. The claim of the company in 1894 that it could not reduce its charges of \$60 to \$125 for these phones has been conclusively proved erroneous, and there can be no doubt in the mind of anyone familiar with telephone data that its present claim is also erroneous. In Grand Rapids, Wis., as I have said, the Bell interest was charging \$36 to \$48, and claimed it could not reduce rates, and yet the people are now actually obtaining equally good service for \$3 a year residence and \$18 for a business place, and a small surplus realized even at these rates. Bell estimates are clearly unreliable. Considering the length of time the Bell companies have been in operation, they seem to know remarkably little about the business when it comes to reducing rates.

With the fine underground system established in Washington repairs and maintenance should cost comparatively little, and the operating expenses are not very heavy. All lines go to the central station, where one operator manages 100 lines, and the public stations in hotels, etc., are managed on the nickel or dime in the slot machine plan instead of having paid attendants as in Boston and many other cities. The \$71 I believe to be more than double the fair figure for working expenses. Companies have many ways of adjusting their accounts so as to show large expenses and small profits. It is a common thing to charge the cost of extensions and repairs to maintenance and operation. Sometimes quite ethereal expenses are put down in the material column. For example, last year in examining the accounts of the Boston gas companies an item of "\$15,000 for gas mains" was found to cover such expenses as \$1,200 to Mr. L, \$1,500 to Mr. M, etc.—L and M being gas lobbyists at the statehouse. This year it is stated on the authority of one of the directors of another gas company that \$1,000,000 is charged on the books of that company to an account that did not receive a dollar of the money, which was abstracted and used for illegitimate purposes. Corporation accounts are very unreliable affairs. And this Chesapeake and Potomac Company has had, without any unlawful abstraction of money, special opportunities of erroneous accounting as to the capitalization and expenses in Washington. These special facilities arise from the fact that Washington is only part of the territory occupied by the company, the stock for its whole territory being \$2,650,000, and for Washington alone \$750,000. A small percentage of error in apportioning expenditures as between Washington and the outside territory of the company might make a considerable difference in the Washington results.

I believe the Manning decision was a judicial blockade of a just law. There was no reliable evidence that the Congressional rates were too low, while, as the court admitted, there was evidence "that in many cities in this country, and also in Europe, telephone service is supplied by the government or by corporations at

rates which appear to be less than those fixed by this act," and there is a vast amount of evidence not referred to in the case which tends to show the unreliability of the company's claims and the fairness of the law. Nevertheless, in view of the well-known power of giant corporations to tangle a court with ex parte statistics, and claim protection against possible loss, it seems to me it would be wise to provide in such acts that the law shall be enforced for a year or two under a guaranty that the Government would make good any deficit resulting from the legislative rates causing the income to fall below working expenses and fair capital charges, providing such deficit occurs in spite of reasonable efforts to make the new rates successful, and is ascertained upon accounts carefully watched day by day by a public officer with full powers of inspection, both of the accounts and the manner of conducting business. In some way the public must take the risk of such changes for the benefit of the public, or else the courts will stand between the corporations and the law. For while the judges say that the law must be unmistakably contrary to the Constitution to be void, they frequently act on the principle that it will be void if the companies can make it appear doubtful whether the new rates will yield a profit. Through some such modification as I have just suggested, or by frequent small reductions, the regulative power may make itself felt; but the only clear, clean, certain, and complete solution is public ownership.

After making this statement regarding the Manning case, I submitted to President Holbrook, of the Massachusetts Telephone Company, the question of the credibility of the \$71 charge for working expenses under Washington conditions. His reply was that the said claim was not only absurd but pathetic, and not only pathetic but humorous: pathetic that a claim nearly three times the reasonable figure should be made, and humorous that men in authority could be made to believe such a claim. With underground wires in a plant like that of Washington, the fair charge for maintenance and operation would be about \$25, according to President Holbrook. In Montreal, a city about the same size as Washington, with wires largely underground, a good profit is made on a \$50 telephone rate established by the Dominion Government. In Rochester, a city of 162,000 people, the independent telephone company has 3,600 subscribers, and the Bell has dropped to 400. The cost of the independent company's lines has been a good deal less than \$100 a line. The plant is bonded for \$400,000, and the stock is \$400,000, a capitalization nearly three times the real value of the plant, yet the company pays 8 per cent dividends with rates of \$36 and \$48 per telephone year. Referring to the New England Telephone Company, President Holbrook says: "The cost of operating they claim is \$11 a phone; the cost of maintenance, \$24 a phone. Their general expense, including taxes, is about \$11 a phone. Now these figures are excessive. There is an overcharge on maintenance of \$13.50 per phone, which is due to the necessity of their building old-fashioned and worn out plants entirely over. They are obliged to pay \$4 a year royalty on each phone, \$2 extra on taxes per phone, owing to the fact that they are stocked and bonded at \$300 a phone; whereas \$100 would rebuild, and in an entirely modern way, their entire system. A capital charge of \$12 in excess is therefore put against each phone. In other words (taking all the facts into account), the New England company is handicapped to the extent of about \$31.50 a phone." As the New England company averages \$58 per phone, this opinion of President Holbrook would indicate \$26.50 as the normal average charge for that company's exchanges, which more than confirms my own estimates stated above.

FURTHER OBJECTIONS.

When the English Government began to consider the absorption of the telegraph, the telegraph companies used every effort to prevent and impede the reform. The objections they raised were:

1. It was not the Government's business to telegraph.
2. There would be a loss if it did.
3. The telegraph would be better conducted under private enterprise.
4. The Government rates would be higher.
5. And the use of the telegraph would decrease.
6. The Government service would be nonprogressive—no stimulus to invention, etc.
7. The secrecy of messages would be violated.
8. The telegraph would be used as a party machine.
9. The Government could not be sued.
10. To establish a public telegraph would be an arbitrary and unjust interference with private interests. The companies had risked their capital in the new enterprise, and just as they were about to get their reward the Government was

going to take the business away from them—private enterprise experimented and the people wanted to steal the fruit.

These objections are very familiar. Our monopolists know them by heart, and use them over and over, taking no notice of the answers to them, no matter how many times they are refuted. It is easy to answer them a priori and the overwhelming demonstration of their falsity by the actual experience of England ought to have buried them forever beyond the possibility of disinterment:

1. It is the Government's business to transmit intelligence, and that business includes the use of the telegraph and all other appropriate means of transmission.

2. If rates remained the same, an increase of profit instead of a loss was to be expected by reason of the economies that would result from a united telegraph in combination with the postal service. The people could keep rates up and realize a large profit, or put rates down, thereby increasing the usefulness of the telegraph, and taking their profit in the form of more and better service for the same money. They did the latter, and, as a matter of fact, they have saved at the lowest estimate \$150,000,000 in 30 years. The telegraphing they have done would have cost them at least \$150,000,000 more than it has cost, including expenses of operation, extensions, repairs, interest on the capital, water purchase, and all.

3. It stands to reason that a manager appointed and paid by himself, and whose avowed interest and effort are to line his own pocket with the utmost possible "giltiness" consistent with his personal safety—it stands to reason that such a manager will not conduct your telegraph or any other business of yours as well as you can do it yourself or have it done by your own agent. As a matter of fact the public telegraph service turned out to be vastly superior to the private telegraph service according to the universal verdict of the English people. Complaints of inaccuracy ceased, and instead of the old delays we find a service as prompt as that of Belgium and Switzerland. "The service is performed with the most perfect punctuality." (U. S. Consular Report on the English Telegraph, Consular Repts., vol. 47, p. 565, 1895.)

4. It was reasonable to expect that the Government rates would be lower, because the Government would work at cost, and would, moreover, secure an absolute economy relatively to private corporations in the conduct of the telegraph. In fact, the rates dropped at once one-third to one-half, and afterwards the ordinary inland rate was again reduced almost one-half.

5. The use of the telegraph doubled the first year.

6. The Government service has adopted new inventions and shown a progressive spirit in respect to employees, as well as the service of the public.

7. There has been no complaint of violation of secrecy.

8. Nor the least suspicion of partisan use.

9. The Government can be sued and is sued. Claims against the Government are tried judicially the same as other claims.

10. Interference with private interests to accomplish a public good is not arbitrary and unjust. It is the very essence of justice and good government. The private interests of gamblers, saloon keepers, opium sellers, shipowners, house builders, powder makers, bone grinders, grain-elevator men, etc.—private interests both good and bad—are interfered with for the sake of the public welfare. Telegraph interests form no exception. The companies had already received large returns on their investment, and would receive full compensation for their capital when the public took their plant—more than full compensation, as it turned out.

There is really no force at all in the current objections to public ownership aside from the patronage question, which is covered by the merit system of civil service and the transfer of the interest of the wealthy classes to the side of good government and honest administration, which accompanies the establishment of public operation.

THE ITALIAN COMMISSION.

The report of the Italian commission of 1880 is often referred to as proving the case for private railways, being ranked as the strongest document in existence against the doctrine of public ownership. Even Professor Hadley, now President of Yale, lays much stress on this report as a proof of the inferiority of public railways. The fact is, however, that the report has little real bearing on the relative value of public and private systems, and while the commission decides in favor of leasing the Italian roads to private companies, its conclusions are practically worthless so far as we are concerned, (1) because the reasons given by the commission for its decision are partly false, invalid on their face, and partly inapplicable to this country; (2) because the commission lacked almost the whole of the important facts and experiences that have since demonstrated the superiority

of public railways, and (8) because the commission was appointed on purpose to make the decision it did make, the commissioners being selected with reference to the conclusion desired by the appointing power.

The commission based its conclusion mainly upon three propositions: (1) That the credit and finances of the Italian Government were too weak to make it wise to undertake the operation of the railroads, needing, as they did, large sums for improvements and extensions, and strong financial backing to steady their operations under the fluctuations of traffic; this was the principal reason on which the commission acted, and it is a reason that is clearly inapplicable to this country; (2) the unsatisfactory results of a brief experience with direct operation in northern Italy (1878-1881), the said results being due partly to the fact that the lines came to the Government from the private companies in a dilapidated condition, and partly to the fact that the road, having been part of an Austrian system, was officered throughout by Austrians, who were, of course, displaced en masse when the road was taken by the Italian Government, as it could not trust the loyalty of such employees, the result being that all the most valuable officers and employees were swept away and their places filled by occupants in large part green and unfit; (3) the idea that "State operation is more expensive than private," a statement the commission thought it had succeeded in proving by showing that the percentage of operating expenses to receipts was lower with private companies than with State systems in a few cases which were given as the evidence, and the only evidence, of the conclusion as to cheapness. Yet it is perfectly clear that the percentage of operating expenses to income may be low, not because of economy in operation, but because the rates are high, and vice versa the percentage of operating expenses to income may be high, not because of lack of economy, but because the rates and fares are low; if the rates were so low that they just paid the cost of operation the operating expenses would be 100 per cent of the income, although the roads might be managed more economically than another system where the rates were high enough to make the income double the operating cost and the coefficient of operation 50 per cent instead of 100 per cent. No conclusions as to economy can be drawn from the percentage of operating cost to income without a careful comparison of rates, volume of business, grades, cost of fuel, labor, etc., elements which may make the percentage of operation vary from 40 to 100 per cent on different lines in the same railroad system under the very same management, and as the Italian commission paid no attention at all to those elements in their study of economy, but based their whole argument upon a comparison of percentages of operating expense to income without allowance for differences of rates and conditions behind those percentages, their conclusion on this matter is entirely worthless.

It must be remembered, further, that the Italian commission did not possess the light we have to-day. Prussia had not made her remarkable success with State roads when the commission gathered its testimony; the law had been passed, but the roads had not been taken over. Austria had not established her great public system either, having only one-eleventh of the railways when the commission gathered its facts. The zone tariff, with its wonderful developments and simplifications, did not come till 1889. Switzerland had not then voted 2 to 1 for public ownership, after studying the question deeply for many years. The achievements of New Zealand and the Australian republics were not in evidence.

Finally, it is charged on high authority that the commission was packed with railway men and agents of those who desired to lease and operate the roads, instead of having the Government take charge of them. (See Quarterly Journal of Economics, July, 1887, article by Simon Sterne.) The railway promoters wanted the lease, and the Government desired it also, in order to get funds for other purposes, so the Government and the railway men united to secure a commission that would render a report justifying the lease. "Soon after the report was made, Simon Sterne, a prominent member of the New York bar, being in Italy as the confidential agent of President Cleveland, received trustworthy inside information that the commission was appointed with the understanding that it should make the sort of report it did in order to enable the Government to lease the roads and obtain thereby much-needed funds for the reorganization of the Army and Navy." (Prof. E. W. Bemis at Massachusetts Legislative Hearing, March 20, 1900.)

REGULATION.

On the subject of regulation, which is the last objection I will speak of, I would like to remark that the plea that regulation is sufficient to solve the problem does not seem to me to be true, for this reason: Regulation can not overcome the antagonism of interest between owners and the public, nor the congestion of wealth

and power, nor the aristocratic tendency. We have antagonism, wealth congestion, and aristocracy instead of harmony, diffusion, and democracy, which are secured by a normal public institution in far greater degree, at least, than they can be secured under private ownership. It is a fundamental maxim of business in modern times that property is to be administered in the interest of its owner; and our business ethics compel the managers of private systems to manage them in private interests; and the same business ethics would impel the managers of the public system with the same earnestness and honesty to administer the system in the public interest.

THE TELEGRAPH.

Passing to the telegraph, I would first like to say that under the Constitution of the United States it seems really to be the duty of the Federal Government to establish a postal telegraph system. The Constitution not merely gives the Government a right to administer the means of communicating intelligence, but the provision is mandatory, and is so understood by jurists. Congress is bidden to supply the people with means of communication. Now, it is a fundamental principle of the law of agency that an agent or trustee is bound to use the best means reasonably attainable for the purpose of his agency.

Q. (By Mr. A. L. HARRIS.) What section of the Constitution do you refer to?—A. The section which deals with post-offices and post-roads. I will give an authority for this in a moment. When the stage coach was replaced by steam railways and the ordinary sailing ship by the steamboat, it became the duty of Congress to adopt those improved means for the transmission of the people's mail, and they did use those means. When the electric telegraph was invented and came into use, and when the telephone was invented and came into use, it was equally the duty of this trustee to adopt the new and improved methods for the transmission of intelligence. That duty has been recognized and strongly emphasized in one of the reports to Congress made some years ago, and as the matter is very important, I will give you the reference: House Report 187, Twenty-eighth Congress, second session, pages 1 to 3.

Q. Is it a majority or a minority report? It was a committee report, as I understand.—A. Yes: it is a majority report.

Mr. PHILLIPS. Please read the paragraph.

The WITNESS. (Reading:) "The Government is authorized and required by the Constitution to carry intelligence. The functions thus devolved on the Government of performing for the people the office of universal letter carrier and news carrier is a matter of the very highest consequence in every light in which it can be viewed. The bare fact that our ancestors refused to leave it dependent on individual enterprise or State control, and rested it expressly in Congress, abundantly attested their anxious sense of its importance and their conviction of the impracticability of realizing the requisite public advantage from it otherwise than by giving it Federal lodgment and administration. But though not anticipated or foreseen, these new and improved modes were as clearly within the purview of the Constitution as were the older and less perfect ones with which our ancestors were familiar; and there being no doubt entertained, either on this point or as to the obligation of the Government to lay hold of the best and most rapid methods of transmission which the improvement of the age puts in its reach, steam power commended itself at once to adoption and has long been extensively employed both on land and water for the carriage of the mail.

"It is not without full reflection that the committee insist on the principle that it was the duty as well as the right of the Government thus to avail itself, even at heavy additional expense, of the powerful agency of steam for the purpose of accelerating the mails."

I think I might omit a little here and still give the whole sense:

(Reading:) "This great and fundamental principle upon which the Department acts (of not being outstripped in the transmission of correspondence and intelligence) led necessarily to using the steam engine in the service of the post-office, and it must and will lead with equal certainty to the adoption of any other newly discovered agency or contrivance possessing decided advantages of celerity over previously used methods. The same principle which justified and demanded the transference of the mail on many chief routes, from the horse-drawn coach on common highways to steam-impelled vehicles on land and water, is equally potent to warrant the calling of the electro-magnetic telegraph—that last and most wondrous birth of this wonder-teeming age—in aid of the post-office in discharge of its great function of rapidly transmitting correspondence and intelligence."

Q. (By Mr. CLARKE.) What is the date of that?—A. That is the Twenty-eighth Congress, second session, March 8, 1845, report of the Committee of Ways and Means.

Mr. PHILLIPS. You will proceed in your own way, Professor.

The WITNESS. The application of the law of agency and the trustee principle they do not mention specifically; but that is an obvious legal method of stating or emphasizing the point made by the committee.

Now, I would like to discuss for about 10 minutes or so the experience of England with her telegraph. As I have already said she tried the private system. Complaints were made of delay, inaccuracy, high charges, and insufficient facilities. Chambers of commerce took the matter up; some of them petitioned the postmaster-general and the Government. An agent, Mr. Scudamore, was appointed by the postmaster-general to go to other countries and study the public systems and compare them with the private systems of England. He did so, and made full reports with the result of showing conclusively, as appeared from the subsequent vote of Parliament, that the public systems of Belgium, Switzerland, and other countries far excelled the private telegraphs of England both in cheapness and quality of service and in facilities. The Government thereupon bought out the English telegraph companies, making the mistake, as I believe, of buying them all out at once—instead of one at a time as the Prussians did with the railways—and paying about four times the real value of the lines. The Government immediately reduced rates very much—from a third to one-half it is estimated, as I have said—and extended the lines into the country districts where the companies had refused to go because there was no profit. They increased the facilities in every way by opening telegraph offices in the post-offices and even making the post-office boxes places where telegraph messages could be deposited.

They secured a great economy by the saving of rents and wages and light and fuel through the coordination of the telegraph with the postal service, the same officers and employees very largely being able to attend to both services, especially in country districts.

Q. (By Mr. PHILLIPS.) Will you give the date when this occurred?—A. They took the telegraphs over at the beginning of 1870. The effect on labor was very beneficial, the Government telegraph pursuing a systematic policy of increasing wages from time to time, so that the percentage of wages to receipts rose from 39 per cent in 1870 to 72 per cent in 1895.

They have also shortened hours so that since 1881 the hours have been reduced from 56 per week on an average to 48 and 42—48 for day work and 42 for night work. All Sunday work is paid for as overtime.

The diffusion of wealth has been helped through the removal of the opportunity for making vast profits out of the telegraph for any individual or group of individuals. The public operation and ownership of the telegraph has brought about a harmony of interest which has been secured by getting rid of the antagonism between the small group of owners and the public.

The benefit to the press has been great through the enormous reduction of rates, which the postmaster-general claims has given England the lowest press rates in the world. The facilities for press work were also greatly increased by public ownership. I notice, however, that some of the newspapers are not wholly satisfied in England with the conditions there in spite of the great reduction and the increased facilities. Public ownership is not perfect, but it is better than private monopoly—it is the least imperfect of the two systems—and sentiment in England is practically a unit to the effect that the postal telegraph is a vast improvement on the private system.

The development of business has been something remarkable. I have already referred to it in brief. The number of messages doubled in two years. The actual amount of business done doubled almost in the first year, and the subsequent increase has been very large, so that the rate of increase in England under the public system has been 6 times as rapid as the development of the telegraph business in America under the private system.

Further, there has been a great strengthening of social ties by the civilizing influences of easy communication among the people. That contrast is brought out very strongly by comparing the testimony of the president of the Western Union some years ago in a Congressional investigation, where he said that 46 per cent of the total business in this country is speculative—stockjobbing, wheat deals, pool-room matters, etc.; that 34 per cent is legitimate trade, 12 per cent is press, and 8 per cent social. Whereas they find that in Belgium and Switzerland and other public systems the percentage of social messages runs up in some cases as high as 63 per cent of the total.

President Green, of the Western Union, in an article of his some years ago in the *North American Review*, said that only about a million people in this country use the telegraph—chiefly the stock gamblers and speculators, and pool room men, and so on, and he asked if that was the class that the Government ought to seek to benefit. In some of their testimony it was stated that they believed the masses of the people would not use the telegraph to any great extent even if they had the privilege of low rates. They apparently regard the farmer as a sort of hermit, or relic of primeval times, who does not care very much about matters of commerce or social intercourse, and has no need or desire to use the best means of communication. But the facts in other countries appear to indicate that, if the rates are low and facilities ample, the masses of the people do use the telegraph to a very great extent. The electric current belongs to the people. It is one of the great inventions of modern times and it ought to be brought within the reach of the people.

Summing up we find that for 27 years Great Britain permitted the telegraph to remain in private hands; that the companies combined to keep the rates up and to destroy any real attempt at competition; that the tariff was exorbitant, the service very poor, the lines confined to the more populous districts, the treatment of employees such as is usually accorded them by private corporations; that a few thoughtful men called attention to the existing abuses and advocated national ownership as the remedy; that the chambers of commerce and the press took up the matter, and with the help of a leading statesman carried the measure against the powerful opposition of the companies and the inertia of those afflicted with the heart failure of extreme conservatism and public distrust; that the immediate results were—

1. A reduction in rates of one-third to one-half.
2. A vast increase of business, the work done by the telegraph nearly doubling in the first year after the transfer.
3. A great extension of lines into the less populous districts, so as to give the whole people the benefit of telegraphic communication.
4. Large additional facilities by opening more offices, locating offices more conveniently, and making every post-office and post-box a place where a telegram may be deposited to be taken to the nearest telegraph office for transmission.
5. A considerable economy by uniting the telegraph service with the mail service under a single control, avoiding useless duplications, using the same offices, the same collecting and delivery agencies, and often the same operatives for both services.
6. A marked improvement in the service, throwing complaint out of the steady occupation she had had so long, the aim of the post-office being service, not dividends.
7. A decided gain to employees in pay, hours, tenure of office, etc.
8. Unprecedented advantages to the press for cheap and rapid transmission of news, at the same time freeing it from the pressure of a power that claimed the right to dictate the views and opinions it should express.
9. The development of business and strengthening of social ties, ties of kinship and friendship, through the growth of business and social correspondence.
10. The removal of a great antagonism and the cessation of the vexatious and costly conflict it had caused between the companies and the people.

Looking at the subsequent history of the English postal telegraph we find—

1. A further reduction of nearly one-half in the average cost of a message.
2. More than a tenfold increase of business in 25 years, while population increased but one-fourth, over 1,000 per cent telegraph growth to 25 per cent population increase.
3. A sixfold extension of lines and fiftyfold increase of facilities.
4. A steady policy of expanding and improving the service, adopting new inventions, putting under ground hundreds of miles of wire that formerly ran over houses and streets, etc.
5. A systematic effort to elevate labor, resulting in a progressive amelioration of the condition of employees in respect to wages, hours, tenure, promotion, privileges, and perquisites.
6. A good profit to the Government (excluding interest on the water-logged capital cost) in spite of low rates, large extensions into thinly populated areas, advancing wages, heavy losses through carrying press dispatches below cost, competition of telephone companies in the best-paying part of the traffic, etc.
7. Satisfaction with the telegraph service even on the part of conservatives who objected to the change before it was made.

Comparing the English situation with our own, we find:

IN ENGLAND.	IN THE UNITED STATES.
Low rates.	High rates (twice as high).
Good service.	Poor service.
Extension of telegraph facilities to the masses.	Facilities only for the classes.
Rapid growth; 40 times as rapid as the growth of population and 4 times as fast as the growth of the letter mail.	Slow growth; less than one-sixth of the growth of the English system.
Progressive improvement of labor.	Progressive maltreatment of labor.
Harmonious, uninterrupted operation.	Big strikes.
Large popular use of the telegraph.	The telegraph an adjunct of speculation.
A management aiming solely at serving the people.	A management aiming solely at serving themselves.
Moderate salaries for leading officials.	Exorbitant salaries for leading officials.
No big fortunes from telegraph manipulation.	The telegraph a millionaire machine.
Universal satisfaction with the telegraph situation.	Universal discontent.
Public monopoly.	Private monopoly.

We do not need to imitate England's mistakes--

- In paying too much for old lines;
- In allowing the telephone to remain so largely in private hands;
- In serving the press below cost;
- In giving the railways a vast service every year for nothing;
- In leaving the telegraph debt to hang like a millstone around the neck of the department, instead of paying it off from the postal profits or other public funds;

In charging new construction against current income.

But we may well imitate her energetic adoption of a needful reform, her economies, her progressive administration, her care for the welfare of labor, her public spirit in this matter of the telegraph.

Now, in regard to our own telegraph system. I will take up first the matter of watered stock or inflated capital, and the question of rates.

First, in regard to the stock. The National Board of Trade some years ago made a summary, which I can supply in detail if you like. The result was this: That \$60,000,000 of stock represented less than \$10,000,000 of actual value which had been issued in the building up of the Western Union; and something like \$35,000,000 of stock, largely stock dividends, which we can not analyze and can not tell just how much is solid and what is not.

The highest estimate I have seen in any of the legislative investigations as to the actual amount of money paid in by the stockholders into the companies that formed the Western Union is \$16,000,000. The plant has been built up out of earnings very largely, and money secured on bonds, and by the issue of stock to some extent, I presume.

The railroad commissioners of North Carolina 3 years ago (1897) made an extensive examination and came to the conclusion that about \$5,000,000 was the actual value of the Western Union plant above the bonds. The stock at that time was about \$97,000,000, which would leave \$92,000,000 of water--about 18 of water to 1 of solid.

I sent circulars to all the States and got a good many replies, which gave the assessed value per mile of line and per mile of wire, and so on; and I also gathered together the statements put out in the Western Union reports, and in the various hearings by their officials. Combining all the evidence it appeared that the plant could be duplicated for 20 to 25 millions, or at the very outside \$80,000,000. That was 4 years ago when I made that investigation. The data on which my estimate was based and the statements of the National Board of Trade may be found in the Arena for March, 1896, and in chapter 111 of the Telegraph Monopoly, Equity Series (1520 Chestnut street, Philadelphia).

Since my estimate was made a careful investigation has been made in Ohio which fully confirms my conclusions. Under the Nichols law in Ohio telegraph companies are taxed on a value ascertained by taking the same proportion of the total market value of the capital stock that the lines in the State bear to the total lines of the company. The assessors took the market value of Western Union

stock, subtracted the real estate and the stocks and bonds of other companies held by them, and dividing the remainder by the total number of miles of line belonging to the company, found the assessable capitalization per mile of line to be \$364. This gave \$3,016,614 for the 8,272 miles of line in Ohio. As assessments in Ohio are at two-thirds value, the Western Union was assessed at \$2,000,000. The company rebelled and took the matter into court, claiming that the law was unconstitutional and declaring that all its property in Ohio was not worth more than \$647,000; that the average cost of the poles was \$1.50, plus \$1 more to put them up ready for wire; that the wire cost \$17.50 per mile and stringing \$4, and that the total cost was \$103 per mile of line—poles, wire, stations, equipment, and everything. This would give (taking the company's figures of 190,000 or 200,000 miles of line, in round numbers) a total of \$20,000,000 as the actual value of the whole system, if Ohio was a representative State, as to quality of the telegraph plant, and that supposition can not be very far out of the way. So the evidence points very strongly at least to the broad conclusion that there is a good deal of inflated value in Western Union capitalization; just how much I would not like to say that I was sure, but a good deal.

Now in regard to the rates: In this country the average receipts are about 31 cents for a 10-word message, not including the address. In several countries of Europe the rates are very much less than that. For example, in England we have a 12-cent rate for 12 words, and in France a 10-cent rate for 20 words. In Great Britain, however, and in France also, they include in that rate the address as part of the words counted; but the actual result on the average brings the telegraph rate in England below 15 cents, showing that the people are able to use the telegraph, even counting the address, to great advantage by cutting down the words so as to bring the communication within a very moderate limit. In Belgium the ordinary minimum charge is 10 cents (for 20 words) and in Germany 12 cents, in Switzerland 12, Austria 11, and the United States 25 cents (for 10 words and the address).

	Ordinary rate per word.	Ordinary minimum charge per message	Average receipt per mes- sage.
	Cents.	Cents.	Cents.
Great Britain	1	12	15½
France	1	10	15½
Germany	1½	12
Belgium	½	10	8½
Switzerland	½	12
Austria	1	11
United States	2 to 7	25	31

This table was prepared in 1896 and revised about a year ago. The ordinary rate per added word in Great Britain was 1 cent, in France 1 cent, Germany 1½ cents, Belgium two-fifths of a cent, Switzerland one-half of a cent, Austria 1 cent, while in the United States the ordinary rate per added word is from 2 to 7 cents, according to the information given to me in the Western Union offices.

Now, whether the rates are too high in this country or not is a question that may be difficult, as we found the question of railroad rates was difficult yesterday. The Western Union officials in their testimony say, in the first place, that the distances are so much greater—double distances, they say, in this country—an average of double the European distance. That, however, hardly seems to explain the difference between 31 cents and 15 cents; because, if we take the total cost given in the Western Union reports for maintenance and reconstruction and divide that cost by the total number of messages, we find that the cost due to distance is not over 3 cents a message, so that half that cost, or the cost due to excess of distance as between this country and European countries, would be only about 1½ cents, which of course would not account for the difference in rates.

The Western Union officers introduced in their testimony tables purporting to show rates and distances in this country and Europe—

Q. (By Mr. PHILLIPS, interrupting.) Where would this testimony be given—at various places or in the city of Washington?—A. In Washington, I think. It was a Congressional committee. The Western Union, in its endeavor to overcome the force of the tremendous fact that telegraph charges here are more than double the public telegraph rates of Europe, made tables of rates and charges to prove their assertion that the difference was a matter of distance.

Unfortunately for the Western Union, the Washburn committee consulted geographies and telegraph maps and found that the length of telegraph routes between the cities of Europe was strangely minified in the Western Union statement, while the distances between American cities were mysteriously larger than those set down in maps and geographies. Here are some examples:

From London to—	Telegraph distances.	
	Western Union statement.	Truth.
	Miles.	Miles.
Dover.....	56	82
Plymouth.....	190	246
Paris.....	200	313
Reims.....	250	400
Hamburg.....	380	556
Munich.....	540	860
Berlin.....	560	722
Prague.....	600	958
Madrid.....	750	1,225
Rome.....	850	1,349
Naples.....	950	1,510
St. Petersburg.....	1,100	1,806

Not one single distance is correctly stated. It is necessary in nearly every case to add at least one-third and often more than one-half of the stated distance to obtain the real distance. The sum of the stated distances was 15,734 miles, and the sum of the real distances was 23,578 miles, or almost one-half more than the Western Union's statement. To show the falsity of statements about American routes it was not even necessary to disturb the dust on the geography—the statement was its own refutation; for example, the distance from Memphis to New York was placed at 2,000 miles, while in other tables of the same Western Union testimony the distance was said to be 1,000 miles. So the distance from New York to Chicago was placed at 750 miles, and to Galena at 1,400 miles, though Galena is only 185 miles from Chicago. Substituting the true distances in the comparison of telegraph charges in Europe and America, the committee obtained very different results from those of the Western Union statement. The rates and distances from Paris to thirty-odd cities all over Europe were placed in one table; a similar table was made with Berlin as a center. For the United States a table was made of the rates and distances from Washington to thirty-odd of our chief cities having distances almost identical with those in the tables of Paris and Berlin. The conclusion of the committee from these tables, together with the corrected tables of the Western Union statement (rates and distances from New York to 61 American cities, and from London to 29 cities in all parts of Europe, the cities in each table being chosen by the Western Union), was that the *rate per mile in Europe was less than half the rate per mile in America*. And the rates compared were for internal traffic in the United States, and for international traffic in Europe. The cost of international communication is more than the cost of internal communication for an equal distance, because the receipts have to be divided among two or more nations, each of which desires nearly or quite as much return as for an internal message, and the division itself entails additional expenses of bookkeeping, etc. *When internal rates in Europe are compared with internal rates in America, mile for mile, the contrast becomes more glaring than ever; the committee found that the rate per mile in England was less than one-third the rate per mile in the United States, and in France less than one-fourth of our rate, mile for mile.*

Q. (By Mr. A. L. HARRIS.) When was that report made?—A. That report was in 1870. Afterwards Postmaster-General Creswell made an examination, and he came to a similar conclusion, that the rates per mile in this country were from 1½ to 4 times higher than they were under the European public systems.

Q. (By Mr. PHILLIPS.) That was just the year that they took over the telegraph in England, was it not? That report was made the year they became public property in England—1870?—A. Yes; that is correct.

Q. Therefore it would compare them under private ownership, at least so far as England is concerned, with private ownership here?—A. No; at the beginning of 1870 the lines in England were taken over by the public and the rates were put down at once. It was the public system in England that our lines were compared

with. In Senate Report 577, part 2, p. 25, Senator Hill, of the Committee on Post-Office and Post Roads—

Q. (By Mr. FARQUHAR.) What year was that?—A. I have not the year. He said to President Green, of the Western Union: "How can you say that your system is cheaper when France sends 20 words 2,000 miles for 20 cents, and in several countries of Europe messages are sent for one-half a cent a word?" President Green replied: "When you understand that we pay more than twice as much to our operators as they do, and that material, except as to wood and coal, is higher, there is every reason why it should be higher here." You see he shifted his ground in two respects. He had formerly claimed that rates were lower here than in Europe, and also that the excess of rates here was due to distance; now he claimed it was due to wages.

Soon after, President Orton, of the Western Union, told the Washburn committee practically the same thing, that salaries of operators in Europe were less than half as much as the similar employees receive here. Immediately afterwards he gave a table which showed that the French telegraph employees below the grade of superintendent got an average salary of \$430, and in the same speech he said that \$2,000,000 was expended for labor by all the telegraph companies in the United States; and the committee found that the number of operators was 6,000, so that if the whole \$2,000,000 went to operators they would only receive an average of \$333 instead of \$360 as would be necessary to make good President Orton's assertion.

The Tenth Census, volume 4, gives the average salary of telegraph employees in Great Britain as \$300, and it has since risen above \$400. In Germany the average was \$300, and it is now stated as \$446 in a recent English work. The average for European countries was \$320. That was in 1880. In 1883 the president of the Western Union told the Blair committee that "the aggregate salaries from president down are between 4 and 5 millions a year." This was in the Senate investigation on labor and capital, volume 1, page 901. He also stated that the number employed and paid by the Western Union Company was about 25,000, which would make the average salary \$200 to the telegraph employee in this country. European telegraph wages are 60 per cent higher on these facts than telegraph wages here, while our wages in general, taking other industries into account, are 50 per cent higher than in Europe.

The Western Union officials also say in their testimony that the work done per employee is greater here; that the efficiency of labor here is greater; they say that it is double. The Tenth Census gives data which show that there were 1,370 messages per employee here and 1,180 in Europe. That does not show "double" work here by any means, but comes nearer to the Western Union statement than might be expected by one familiar with their methods. The larger number of messages here per employee is partly due to the longer hours, and to the selection only of the more populous districts through which to run Western wires, so that the assertion as to efficiency is not wholly to the credit of our system. Probably, however, our efficiency is somewhat greater even in the telegraph system in spite of the lower average pay.

But I would like to call attention to the fact that if, as on the Western Union testimony would be the case, the efficiency of their labor is twice as great as that of Europe and if, as investigations bring out clearly, the wages are found to be lower here on an average than in Europe, they ought to be able, so far as wages are concerned, to furnish telegraph services at lower rates here than in Europe, more than balancing the difference in distance, which, as I said, was only a cent and a half, so that upon Western Union data they ought to make the rates here even lower than they are under the European system.

In reply the Western Union is likely to say, and has said—there is a deficit under the public systems of Europe. It is true that a deficit has appeared in Great Britain, but it has not appeared so far as I am able to ascertain in the other systems. The returns of the telegraph and telephone systems are merged, so it is not possible to tell certainly whether the telegraph alone makes a profit, but the two systems together do make a profit in Belgium, France, and Germany—a very material profit.

The value of these Western Union statements may be estimated perhaps by recalling the fact that one of their presidents said that governments never made any profit on anything, whereas we know that Prussia is making \$75,000,000 a year on her railway system, net profits turned into the treasury; the British post-office is turning in some \$16,000,000, and many other countries are making large profits on their public industries.

I would like to give here a conversation which occurred between the president of the Western Union, Dr. Green, and the Blair committee, and which will be

found in the Blair Report of 1885, Senate Committee on Education and Labor, volume 1, page 875:

"Q. What is it that causes the great disparity between your rates and the rates charged between England and the Continental countries?"

"GREEN. I think a good deal of it grows out of the conducting of a commercial business by the government and the conducting of the same business by individual enterprise.

"Q. Do you know of any other cause to which the difference can be attributed?"

"GREEN. No, sir; salaries are much lower there than here. They pay much less for the service than we do.

"Q. Is the telegraph a source of revenue beyond expenses to the governments abroad?"

"GREEN. I do not know of any government that has ever made any profit out of the telegraph." [Very extensive knowledge.] "The British post-office system claim to be making about expenses, but they get large appropriations every year. They claim, however, that those appropriations are for the extension of the plant, the construction of new lines.

"Q. They must do much less business there than is done in this country in proportion?"

"GREEN. No, sir; they do a larger business in proportion to the amount of wires they have than we do in proportion to our wires.

"Q. Then, if they are doing a larger business with cheaper labor, and are receiving much higher prices than you receive, why should they not make money?"

"GREEN. Well, I do not know why; but somehow governments never make any money out of anything.

"Q. You state the fact as you understand it, but you do not feel called upon to account for it.

"GREEN. I do not feel called upon to account for it."

I do not think in all the history of cross-examination a witness was ever tangled up any more beautifully and brought to a clearer *reductio ad absurdum* than in that examination.

Now, as to the deficit in England. In the first place England paid 4 times the fair value of the lines—an example which we ought not to follow; in the second place she pays high wages; and in the third place she has been burdened by great competition of the telephone; in the next place the Government is not aiming at profit at all, but at the development of the country, as I said yesterday—the development of other industries, business in general, social intercourse, etc., and they get, even on the financial basis, very large returns—far greater than any experienced deficit—from the superior development of the industries of the country through low rates. They have 2 telegrams per capita to 1 in this country.

Q. (By Mr. PHILLIPS.) Please state whether they created a sinking fund and have liquidated the purchase money yet, or is it still bonded?—A. It is still a funded debt, still bonded. I think they made a mistake in that, in not using the great profits of the postal system, of which the telegraph is a part, to pay off the telegraph debt, and so release it from that burden. It is just as absurd, it seems to me, to keep that debt and turn in a large postal profit, as it would be to keep a debt on mail boxes or pneumatic tubes. It is a part of the postal service and ought to be paid for with postal profits.

There is another point. Telegraph experts in England told the inventor, P. B. Delaney, according to his testimony, that if the expenses were properly divided between the postal system and the telegraph—the mail system proper, I mean, and the telegraph—there would be no deficit, in spite of the tremendous interest on the overgrown debt. They say that the postal authorities are anxious to make a strong showing for the mail department as compared with former records and that they are not quite fair in the division of expenses. How slight a change would account for all the difference can be seen when it is stated that a 2 per cent variation in the division of expenses between the mail department and the telegraph would more than cover the deficit. The very low rates to the press, carrying large masses of press matter at 9 cents per 100 words, is another element that must be considered, and the free service to the railroads, so that in reality I do not think much weight can be placed on the English deficit.

John Wanamaker in 1890 made some investigations, which he told me personally resulted in his judgment that a uniform 10-cent rate—

Q. (Interrupting.) When he was Postmaster-General?—A. Yes. He told me a little while afterwards that his investigations had led him to believe that a uniform 10-cent rate in this country with the postal system would be remunerative and cover all cost.

We may see from the example of a little line between Milwaukee and Chicago, put in some years ago, how excessive our rates are in some instances. That company made at first a 10-cent rate, and paid back from 30 per cent to 40 per cent of the receipts to the patrons of the road after paying a large interest (7 per cent) on the capital. Subsequently they reduced their rate to 5 cents, or half-cent a word, and still paid back from 25 per cent to 40 per cent of the total receipts to the patrons of the company, although they had doubled their stock, making it half water. There is a vast mass of facts which go to indicate that our rates are high; that is one of the most interesting perhaps.

The treatment of labor by our telegraph system is, I think, one of the most objectionable features of the management. According to the testimony of telegraph employees in various investigations and Congressional hearings, a systematic policy of reducing wages has been pursued by the telegraph monopoly. They have put boys to work in the offices to learn the business, and then if the operator resigned or moved away or did not prove satisfactory, or if for any other reason his office became vacant, they would offer the place to this young student or apprentice at \$5 or \$10 less than the salary formerly paid: and in that way and in other ways they have reduced the wage so that, according to the testimony, it was reduced 40 per cent from 1870 to 1883.

The great strike of 1883 throughout our telegraph system was largely due to the low wages and long hours. They asked for an increase of pay of 15 per cent and for 8-hour work, and no salary lower than \$50. These requests, moderate as they were, were refused, and the great strike was fought out at a cost altogether of over \$1,000,000, and after the strike, according to Western Union testimony, the result was that the company was able to get about one-third more work out of the men for the same pay. The hours of operators are in many cases very long, the work is very trying, and they are apt to be affected by consumption and other diseases—unable to continue many years under the strain.

Q. You have no knowledge of how many are male employees or female?—A. No; I have not the difference.

They also blacklist their employees, I understand from the workers, so that the man who meets with their disapproval is practically unable to get employment in the country. They try to shut out the unions of the men, and they even deny them the privilege of petition. The men say that the leaders in presenting a joint request for amelioration of conditions, if found out, are almost sure to be discharged from employment.

The profits of the system may be realized from a couple of statements. Postmaster-General Wanamaker in 1890 found that early investments in Western Union stock had received an average of 300 per cent cash dividends per year from 1858 up to that time (1890), and 150 per cent a year in stock dividends besides. In 1858 the capital stock was \$385,700. From 1858 to 1866 the stock dividends were \$17,811,140 and the cash dividends \$4,156,240, a total of \$21,967,380. The annual earnings were \$2,745,920. The cash dividends in that period were 100 per cent a year and the total dividends 700 per cent a year. These figures constitute another proof of high rates. Excessive profits prove that charges are exorbitant.

Our telegraph facilities are not what they ought to be, because private monopoly naturally and necessarily limits itself to regions that will pay, whereas public ownership tries to give the whole people the benefit of the service.

Poor service is very strongly brought out sometimes by such experiences as these: Several cases are in evidence where persons before going on a railway trip have telegraphed to the friend they were going to visit that they were coming—telegraphed sometimes 2 or 3 hours before they started—and yet they have been able to travel hundreds of miles and get to their place of destination before the telegram. I recently had that sort of experience myself. I telegraphed from New York City to Philadelphia, and half an hour later I took a train and went to Philadelphia; half an hour after I got to the house my friend received the telegram saying I was coming. That is simply one of many illustrations that our service is not what it ought to be.

Professor Ely and former president Walker of the Institute of Technology, and many other men who have traveled extensively in Europe, have told me that the service in Germany and Great Britain was in their judgment greatly superior to our service except where speculative telegrams are concerned. Instead of being an advantage, that is in my judgment a fault of our system, that it discriminates in favor of speculative telegrams, even setting aside, according to the testimony, not only social messages, but Government business, and violating the law in so doing, in order that speculative messages should go first.

Postmaster-General Wanamaker accuses the Western Union of having bought up and shelved, or otherwise suppressed, 16 inventions, instead of giving the

country the benefit of every improvement, as a public system would be likely to do. The tendency of the private monopoly is to adopt only those inventions which improve the service and also increase present profits. If an invention, no matter how great the improvement may be, will make their present investment practically valueless so that they will have to rebuild the system, they are apt to try to repress that invention and keep their capital intact until they can wear it out and get all the service out of it.

The company goes into politics to a certain extent. It has distributed favors among various legislators and among Congressmen, and Western Union testimony is explicit as to the benefits they have received. Long ago the president of the Western Union said:

"The franks issued to Government officials constitute nearly a third of the total complimentary business. The wires of the Western Union Company extend into 37 States and 9 Territories within the limits of the United States, and into 4 of the British Provinces. In all of them our property is more or less subject to the action of the National, State, and municipal authorities, and the judicious use of complimentary franks among them has been the means of saving to the company many times the money value of the free service performed." (Western Union report of 1873. See also Wanamaker's argument, p. 164; Postmaster-General Creswell's report, 1875, p. 49.)

The passage is constantly cited by writers and speakers dealing with the telegraph, because of its astounding nature and implications. I have it on the authority of one of the most distinguished members of the United States Senate that "books of telegraph franks are tendered to every Senator and Member of Congress, and most of them accept the favor." The company confesses it has received large benefits from this distribution of favors, and some of us have thought perhaps the reason Congress has not been more alive to this question and has not passed laws asked for by petitions, signed in some instances by as many as 800,000 voters and backed up by some of the strongest men in the country—that the reason may be that they do not want to get rid of a system under which they can do their telephoning free and come to a system where they would have to pay for their own private telegrams at any rate, and to a system under which they would get no profits on telegraph stock. Perhaps I am unjust to Congress; I hope I am, but it is a little difficult to see just what influence could withstand the enormous pressure of thought and business interests brought to bear by John Wanamaker, for example. He told me he was the most disappointed man in the country; he expected fully to pass his bill, but found he could not.

METHOD.

Now, this question of method: A public plant may be secured in many cases, or in all cases, probably, without a dollar of taxation. This can be done in two or three ways. The Government may, in giving a franchise, put into it a clause that at the end of the term—20 or 30 or 50 years—it shall become public property free of debt. That has been done in France and in Italy and to some extent in Germany and England, I believe. Another way is for the Government to issue bonds and pay off these bonds out of the earnings of the system, as is being done by the railroads in Belgium, Germany, and Austria-Hungary. Another plan, which is especially applicable to municipal monopolies, is for a group of citizens to advance the capital and make the plant a public one, but worked under a lease so that the operation is governed by the private parties and the city together—a copartnership—until the capital is paid for out of the earnings, at which time the system becomes completely public. This plan has been adopted in Springfield, Ill.—substantially this method—with the electric plant with very good results.

A more serious question relates to the method of procedure in taking over a private plant or a part of it, and also the question as to construction or purchase.

In reference to the telegraph, I believe that a good method would be to begin by offering to purchase a few of the chief lines if the companies are willing to sell at a reasonable valuation; if not, the Government, under its constitutional power to build post-roads, should construct lines joining some of the main centers and gradually extend the lines, making reasonable rates, but not the lowest rates, not to cut the bottom out from under the company completely, simply to bring a little pressure to bear, and then do as the Prussian Government did with the railroads; say to the company: "We will buy your lines one after the other if you will put a reasonable price upon them; if not, we will apply competition and continue to construct, till you are ready to sell at reasonable figures what we may wish to buy."

In reference to the railroad system the same method might be adopted, but it

is more difficult on account of the great cost of new lines and the established character of the present system. Therefore I believe the practical plan there, when public sentiment is ready for public roads, will be to buy out one or two great systems—one great system, perhaps, from east to west—and then make reasonable rates and simple tariffs and gradually absorb the other systems on the same plan that Prussia did and as New Zealand is now doing.

As steps preliminary to construction or purchase, investigation and publicity are of the utmost importance and every effort should be made to bring the innermost facts in regard to these great monopolies to the knowledge of the people. If a law could be passed which would open the accounts of all corporations to public inspection, I think it would be of very great benefit; and if a competent expert could be sent out, some officer of the postal system, as was sent in Great Britain, or some man of acknowledged ability and impartiality could be sent to study other systems and our system and make a scientific colorless report—no propaganda matter in it whatever—in regard to the conditions of labor and service, and so on, in the railroad, telegraph, and telephone systems of various countries, I believe it would be of great benefit, as it was in England. What we want is light; and with light I believe the public spirit of the people and the intelligence of our legislators can be relied on in the end to produce true results.

Q. (By Mr. CLARKE.) Before you recapitulate I would like to ask one or two questions. In Europe do the public-owned utilities set aside a percentage of gross earnings for depreciation to provide for renewal of plant?—A. It is just the same as with our private companies here—some do and some do not. In the Belgian and German systems they are very careful indeed to cover depreciation. In many of our own—take the Massachusetts companies, that I am most familiar with—very many of them do not allow anything for depreciation at all, and it is the same way with some public plants. My experience is that the public plant is a little more apt to make provision for depreciation than the private monopoly.

Q. You believe it should be done?—A. Certainly.

Q. Now, in regard to the basis of capitalization on which you take over the properties of corporations, do you recognize that the securities of corporations are in the nature of a contract between the company and the holder of the security?—A. Yes; I am in favor of being very liberal on account of what I understand to be the doctrine of estoppel. The companies have in many cases violated not only law but common honesty in inflating their capital; in other instances the inflation is not morally reprehensible. In the first class of cases there is strong argument in favor of those who think that that sort of inflation should be cut out in spite of the fact that the stock and bonds may have come into comparatively innocent hands. They say there is no such thing as an innocent purchaser nowadays, because everybody knows that these fraudulent stock issues have been made. I think, however, as the change is to be made for the public benefit, the burden of the change should fall on the whole people who are to reap the benefit, and not on any class, especially as that class, however much to blame they may be, have been encouraged in their action by the silence and acquiescence of the public. In a democracy it appears to me that if the people stand by and see a railroad issue stocks, and take no measures to prevent it, they ought to stand the consequences of that stock getting into the hands of men who buy it for good money in the open market.

Q. Then it is your belief that any law enacted by Congress or a State legislature for making these corporate properties public utilities, should take into consideration the constitutional provision against impairing the obligations of contracts?—A. Certainly; but that is not the point I am dealing with. I do not think our governments are bound legally to pay for inflated values. I place my argument upon the moral obligation of the people; as they have allowed this thing to go on they ought to share the consequences, and not shuffle them off now that they have got their eyes open a little more, and make these consequences fall on one class; but so far as the legal rights are concerned, I think the Government has a perfect right to build a line, and, in fact, it has been held by the Supreme Court of the United States that the Government has a right to build a bridge or railroad right alongside another, and take away its value completely, if they choose to, unless an exclusive franchise has been granted. We have a right in that way, or by legislative regulation of rates, to squeeze the water and wind out of these overgrown capitalizations, but I am not in favor of doing that to any severe extent. I think we ought to stand the consequences of a system that we have ourselves permitted.

Q. (By Mr. A. L. HARRIS.) If a railroad company has \$100,000,000 of common stock and that stock is only worth 20 per cent, you would merely undertake to pay the value of the stock and not the inflated value?—A. The market value. That is the rule of law, that we should pay the market value.

Q. That, then, would reduce the value of the railroads that the Government would have to pay much below the 11 or 12 billions of face capitalization?—A. Yes. To make my idea a little clearer, let me go back to Vanderbilt's time. When he increased the Hudson stock, I believe a true public spirit would have prompted men to protest immediately in the courts and before the legislature and try to stop that thing before the stock got into the hands of innocent purchasers. If the people had done that and followed up that policy consistently, I believe they would have a good right to claim that they should buy the roads at their actual value, but as they did not do that and as practically the whole country by inaction has acquiesced in that system, it seems to me it is not fair to turn around and say: "We have stood by and let you issue a lot of extra stock, and men have bought and paid for it, in many cases without means of knowing whether it represented value or not, but we've come to the conclusion, now that we want to buy the roads, that this won't do, and we've determined to knock the bottom out of the whole thing and pay only actual value for the roads."

I disagree in that, however, with most of my friends. Even Professor Bemis thinks I am too conservative on that point. He believes the water ought to be squeezed out. He advocated that the Boston and Albany should be purchased by the State at \$27,000,000, as they had the right to do under the charter, although they had allowed a process of accretion to bring the capitalization to about \$65,000,000. I do not think that would be fair. I think it would be wrong; we have a legal right to do it, but not a moral right.

Mr. PHILLIPS. Have you anything further to state, Professor, by way of conclusion?

The WITNESS. Only that I think the line of least resistance in industrial progress in this country at the present time is to work for public ownership and the cooperative organization of municipal monopolies, such as electric light and street railways. The movement for municipal street cars is very strong in Detroit and in Chicago, and in some other cities there is a vigorous sentiment in favor of public telephone exchanges and such things as that. I do not think it is advisable that national railways should be attempted until the growth of sentiment in this country is very much stronger in favor of it, which constitutes a powerful reason for putting forth every effort to enlighten the people upon the enormous benefits of a well-managed system of public railways in order that we may develop as soon as possible the conditions that will make it wise to establish public ownership and operation of our railroads. On the other hand, I do not see any reason why the manifest duty of Congress, under the Constitution, to provide the best means for transmission of intelligence should not at once result in taking the first steps toward the establishment of a system of postal telegraph and telephone communication.

(Testimony closed.)

WASHINGTON, D. C., March 5, 1901.

TESTIMONY OF MR. ALBERT B. CHANDLER,

Of the Postal Telegraph Company, No. 253 Broadway, New York.

The commission met at 11.22 a. m., Mr. Farquhar presiding. At that time Mr. Albert B. Chandler, of the Postal Telegraph Company, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will please give your name and address and official position to the stenographer.—A. Albert B. Chandler, No. 253 Broadway, New York. I have been president of the Postal Telegraph Company for 15 years, and am now chairman of the board of directors.

Q. (By Mr. CLARKE.) Will you please give us a concise history of the organization and development of the Postal Telegraph-Cable Company?—A. The Postal Telegraph-Cable Company is a reorganization of the original Postal Telegraph Company, and has been 15 years under its present organization and management.

Q. You may give, if you please, a statement as to whether or not any other companies entered into it.—A. In its development it has acquired quite a number of smaller telegraph companies that had been built up between the years 1880 and 1890, but the property is chiefly of its own construction.

Q. Were those other companies local, or did they aim to do and undertake to do a general telegraph business?—A. Several of them were of sufficient extent to say that they were doing a general telegraph business, but they were all local—that is, none of them were extensive, none of them covered any considerable portion of the country.

Q. When were the Postal Telegraph Company and the Commercial Cable Company united?—A. They have from the first been in very close alliance, under contracts of connection. They have been substantially one property since January, 1897.

Q. We shall be pleased to have you give the capitalization of the company in bonds or stock, if both classes of securities have been issued, and also its mileage, number of offices, number of employees, etc.—A. The capital stock of the Postal Company was, at the time of the acquisition of the property by the Commercial Cable Company, exchanged for bonds of the Cable Company. The Postal Company has never issued any bonds; that is, the present Postal Company. What we term the land-line portion of the property is now represented by the bonds issued by the Cable Company in exchange for \$20,000,000 of stock that had been issued previously and for property since acquired. The total amount is \$20,000,000.

Q. That is, of bonds?—A. Yes, sir.

Q. (By Mr. FARQUHAR.) Is the whole capital stock in bonds?—A. Yes. On the land-line properties there are no shares of stock outstanding, excepting that the land-line system consists of nearly 40 different corporations, and in many of these corporations the entire capital stock is not owned by the Postal Telegraph-Cable Company, nor by the Commercial Cable Company.

Q. In what shape is the capitalization of the Cable Company?—A. That is in stock.

Q. Do you include that stock in your \$20,000,000?—A. No. I would like to be excused from answering for the Cable Company in respect to any of its affairs, for the reason that the organization is absolutely separate from the land lines. It is a trans-Atlantic property, and although its business is closely related to the land-line business, any inquiry made respecting it should be made of an officer representing that company.

Q. What interest do the bonds carry?—A. Four per cent.

Q. Can you state anything with respect to your dividends?—A. The Postal Company earned and paid 4 per cent dividends previous to the sale of its property for a comparatively short time, and it has earned the interest that has been paid by the cable company on the bonds since.

Q. Have you any sinking fund in connection with it?—A. No.

Q. Have you a cumulative feature in your interest bearing?—A. We have not.

Q. Any debenture bonds?—A. No; the bonds are mortgage bonds.

Q. Do these bonds cover simply the whole property, or do they also cover franchises or patents?—A. They cover whatever the company has acquired, and the company's acquisitions have been not only in physical properties, but in franchises, patents, and a variety of requisites for carrying on the telegraph business that have cost money.

Q. Your bonds cover what you might call good will or the working franchises of your company?—A. Yes; they cover everything that belongs to the company.

Q. (By Mr. FARQUHAR.) Is this alliance with the Cable Company in the form of contracts or in material and ownership of lines, or is it simply in control of it?—A. It is simply in control of it.

Q. Have you used the surplus earnings of your company in extending your lines?—A. Yes. Our surplus earnings have been used in part to build up the system. The company did not begin the payment of dividends until April, 1896. It is impracticable now for us to ascertain accurately the amount of surplus earnings that have gone into the property.

Mr. FARQUHAR. It would be interesting to know how much surplus earnings have entered into the extensions. It would save people afterwards thinking there was a covering in the matter that had not been brought out by the commission itself, and from your annual reports it would be easy to summarize how much surplus went into extension.

Q. (By Mr. CLARKE.) In brief, was the company paying dividends when you became connected with it?—A. Very far from it. It was operated at very heavy loss.

Q. What is the present extent of the property and amount of business being done?—At the close of last year our mileage, poles and cables, not including the Atlantic cables, was 26,043 miles, and the wire mileage, 169,236; the number of offices, 2,781. The number of messages transmitted last year was 16,523,444. This refers only to the property of the Postal Telegraph-Cable Company, and does not refer to its Canadian connections or any other of its connections, nor to the cable service.

Q. (By Mr. CLARKE.) Can you give the average rates per message?—A. The day rates for messages of 10 words, exclusive of date, address, and signature, range from 20 cents, applying locally in a few cities, to \$1, applying between the

extremes of the Atlantic and Pacific coasts. The average amount received per message by the Postal Company during the year 1900 was 34.2 cents.

Q. (By Representative OTJEN.) Can you give States or localities in which your lines operate?—A. We cover the country pretty fully from Maine to Oregon and California.

Q. It would be substantially correct if you said you covered the whole United States?—A. Almost all of the commercial centers of the United States are reached by our system now. There is no very considerable city that is not in communication with us, and our business may properly be said to be interstate business. I do not mean that there is not a great deal of local business within the States; what I mean is, all offices accept business for any State.

Q. (By Mr. CLARKE.) Is your business competitive in all these places with the Western Union?—A. No. We have a good many offices at places where the Western Union has none; that company has a great many more offices at places where we have none. In the whole system, including Canadian lines and all others with which we "check direct," as telegraphers say (we check direct with offices that are not our own under contract relations, and they check direct with us), there is no transfer point at which business and tolls are divided, and messages go through as on one line, yet there is a division of tolls out of our whole system reckoned in that way which adds largely to our number of offices. There are a little over a thousand offices that are not reached by Western Union lines.

Q. In places where both companies have offices is your business competitive?—A. It is essentially so.

Q. Have you any understanding or agreement with your competitors in regard to a division of business or in regard to the method of conducting business?—A. We have no agreement or understanding with the Western Union Company with reference to any division of business. They have no interest in our company, its property, or its business, and we have no interest in theirs; but we have an understanding with them respecting rates and respecting certain methods of competition, the giving of rebates, and things of that kind, that are equivalent to paying for the obtaining of business. We aim to put an end to that form of wasteful competition.

Q. What had been the practice concerning rebates and other forms of cutting prior to this agreement?—A. Such methods had prevailed to a very large extent previous to 1888, to a very injurious extent to all concerned. At the time such understanding was had a large number of rates were reduced, long-distance rates particularly, and the very low rates—10, 15, and 20-cent rates—that had been established by the various smaller competing companies were done away with, it having been well ascertained that the more business done on that basis the worse for the doer of it.

Q. Who had been the principal beneficiaries of the cutting, or the rebate, or whatever form the competition took?—A. The commercial public, chiefly. Of course the general public benefited to a certain extent, but large commercial houses were the chief beneficiaries of that system of conducting business.

Q. Were they generally commercial houses or brokerage houses?—A. Both, and under the system of rebates the meanest would get the largest favor. That may not be a very graceful way of putting it, but it is a fact.

Q. That is to say, the man who was most enterprising in pushing for the reduction?—A. The one who insisted on having the largest rebate that could be allowed, or else he was "going to give his business to the other company."

Q. Since this understanding all that has been done away with?—A. Practically all. It is not the intention of either company to allow anything of that kind to happen.

Q. Thereby a small customer is as cheaply served as a large customer?—A. Just the same, and that is a point which perhaps people not acquainted with the telegraph business might understand by an explanation better than they can if they never have given it any thought. It is not exactly like carrying letters or carrying freight, by which you can carry a car approximately at the same price as you can carry half a car, but in the transmission of telegrams the facilities are used exactly alike, for every message of equal length takes exactly as much time of the operating service and as much use of the line as every other message of equal length. There is a limit to the capacity of wires, and carrying messages, therefore, is not the same as carrying on a business on the plan of wholesale and retail, which has been often urged.

Q. In this connection, concerning unfair advantages, I would like to inquire to what extent the free-frank privilege prevails in your company.—A. To a much lesser degree than has been true of other companies, and still it prevails to a considerable extent in our company—unfortunately, to a growing extent. The number of people who like to avail themselves of that privilege grows with every

year. Originally franks were only given in our service under contract relations involving reciprocal service. They are now given in case of quite a good many public men who think they are entitled to the free privilege. I do not know why, but they seem to think so.

Q. Do you give franks voluntarily or only when they are asked for?—A. I do not think I can answer that question by saying that either is true in every instance. In the main, our franking privilege is extended upon application.

Q. (By Mr. A. L. HARRIS.) When you say you give franks to public men, do you mean members of State legislatures?—A. They are about as eager as anybody else in their pursuit of franks.

Q. (By Mr. FARQUHAR.) Is the franking privilege usually extended to members of Congress?—A. For quite a good many years the Postal Company never issued a frank to a member of Congress because he was a member of Congress. There were some members who were connected with railroad service or with some other business with which we had reciprocal relations which entitled them to free service. At present, perhaps under the necessity of meeting our great competitor, as much as for any other reason, and on account of applications, for another reason, there are quite a large number of members of Congress who hold franks of the Postal Company.

Q. Does the privilege extend down to members of municipalities, aldermen, mayors, and judges of the courts?—A. To a considerable extent; not everywhere; not to all, but to a considerable extent.

Q. (By Mr. CLARKE.) Do you have to get franchises or privileges from cities or towns for the erection of poles, etc.?—A. Yes. It is now, I think I may say universal, that in going through any city or town we have to acquire a franchise. Of course we always had to obtain a right of way; but now it is the practice to require a formal franchise in every incorporated city or village, for they undertake the regulation of telegraph affairs to a greater or less extent. We claim that under the post-road act of Congress of 1860, and the amendments thereto, a municipality can not prevent our erecting poles and wires in the cities, but can only regulate the construction. Practically, however, the difficulty of obtaining an ordinance from the municipality for the construction of our lines is as great as though we obtained an entire franchise from the municipality.

Q. Do you have to pay for these contracts, franchises, or privileges?—A. The manner of acquiring them varies about as much as the number of places we go through. Hardly two are alike, and in one way or another they have to be paid for. Our preference is to pay a reasonable concession to the city government; that is the preferable way of dealing with it, and let that end it.

Q. But does that end it?—A. Unfortunately, it does not always end it.

Q. Do members of the city government have to be seen personally?—A. I have never seen any of them personally, sir, and I do not know; not in the way you use the word "seen."

Q. I used the word in a perfectly innocent sense—whether they had to be conversed with in order to get their consent to hold a meeting, to pass a vote, or anything of that sort.—A. It is very common to make our wants known and to explain our purpose and the extent of our use of the public highways or other privileges, and make it understood that we are trying to do good and not harm, and are willing to pay what is reasonable, right, and proper to the municipality for it. We endeavor always to remove all reasonable objections to our extension, to place our poles where the city engineer or city officers desire them to be placed, and generally put ourselves in accord with the city authorities. We can't always do the business with such harmony and under such conditions as we would like to.

Q. (By Representative ORJEN.) Do you meet with any opposition coming from the competing companies? I mean in obtaining franchises through municipalities.—A. Sometimes we have done so. I can hardly say that at the present time there is any opposition of that kind, unless there should be some question particularly interfering with their own route. There has been some conflict in regard to interference with each other's lines, but we take good care to avoid all conflict of that kind, and it rarely happens any more.

Q. (By Mr. CLARKE.) Do you keep any account in your company of the business value of the franks that you give?—A. Yes.

Q. Are they given in such a way that you know exactly how much you are out of pocket by means of that or how much they favor the man who receives them?—A. Yes. The account is not as accurately kept as that of paid messages, but it is intended to be a substantially accurate account. Our franks that we call complimentary are issued in the form of books of stamps, something after the style of the postage stamp, each stamp covering a message of 20 words or less, and an additional stamp for additional words. We have certain franks that are issued

in the form of cards for some special reason, chiefly to railroad officers, and of these an account is also kept. I am happy to say that a large proportion of people using our franks treat them very reasonably and fairly. Sometimes people like to telegraph on trifling affairs and send very long messages when perhaps letters ought to be sent.

Q. (By Representative OTJEN.) You spoke of giving franks to public men, public officials; do you also give franks to people doing private business not in a public line?—A. To a very limited extent; that is done as a matter of reciprocity; sometimes in payment of rent, sometimes in payment for pole privileges, rights of way, and other things of that sort. Sometimes we pay for what we acquire by the issue of franks instead of by paying money.

Q. (By Mr. KENNEDY.) Do you give them to editors of daily newspapers or their representatives?—A. Newspaper correspondents and newspaper proprietors to a very considerable extent have the franking privilege.

Q. (By Mr. CLARKE.) They also have a special press rate for news messages?—A. Yes, their rate is different from the commercial rate, but the rates are alike for like service. There are several classes of newspaper service, and the rates are uniform for each class of service.

Q. On what principle are those franks extended to newspaper men?—A. They are constantly with us. It is a matter of accommodation; it is a privilege that has grown up by long years of practice, and in the main I think is discreetly used.

Q. Do you give franks to other large customers?—A. No, not for the purpose of securing their business. That is another evil like rebating; that would be simply another form of rebating; we do not undertake to do that.

Q. Is it on the principle that the representatives of the press are in a sense public men that franks are given them?—A. Hardly that. A good many of them are old telegraphers; a good many of them have been personal friends of the officers, and they come in contact with us in a different way from what the general public do. The practice has grown up from a very early day. I do not know that I can give you any better reason.

Q. (By Representative OTJEN.) Do I understand you that these franks are confined to messages concerning private or social affairs, or do you give franks to papers whereby they may transmit news connected with the paper?—A. There are business franks issued for business purposes and as a way of paying for rights and privileges and benefits. The complimentary franks are for personal and social messages.

Q. But do I understand you that you give franks to newspaper men which enable them to transmit news to the papers?—A. No; we do not.

Q. News messages are paid for?—A. They are paid for at newspaper rates, special rates, or whatever the rate is, according to the class of service that is performed.

Q. (By Mr. KENNEDY.) I would like to ask how that rate to newspapers compares with the rate that is given to the commercial public and the public generally?—A. It is a much lower rate.

Q. How much lower?—A. That differs according to the circumstances of the case and the distance and number of papers served. For instance, in many cases a great many papers are served by one sending and distributed to 20 or 30 different places, and of course a service of that kind is not comparable with service of one delivery at each place. It is not comparable with ordinary commercial service.

Q. Is it not less than one-half the rate given to the business public?—A. There are several classes of newspaper rates. The lowest applies to dispatches filed by a press association, to be delivered at 5 or more places at one sending. On such the rate to each paper may in some cases be as low as one-fifth of a cent a word. Rates on newspaper specials vary from a quarter of a cent a word on matter transmitted at night, between comparatively near points, and one-half a cent per word for the same service transmitted during the day, to 1½ cents per word for night and 3½ cents per word for day service between distant points.

Q. (By Mr. CLARKE.) In your opinion as a financial manager of a telegraph line, could the franking system be dispensed with without any injury to the company as well as to the public?—A. In our company the franking business is not so serious an item as to be a great factor either way. As a matter of individual judgment, if the whole franking privileges of telegraphs and railroads could be done away with, and everybody be induced to pay his own way, I should be glad to see it done; but under the conditions existing it does not seem likely to be accomplished.

Q. (By Mr. FARQUHAR.) By abolishing franks on telegraphs and on railroads, would the general public gain anything by cheaper rates?—A. So far as our company is concerned, the franking is not a sufficient factor in the occupancy of our wires to have any perceptible effect that way. I think I can say that with certainty.

Q. So it just stands in the relation of a privilege to certain favored parties?—A. Yes.

Q. And financially you would not say it would be any benefit to the general public to have it abolished?—A. I do not see that it would make it possible for the public rates to be reduced.

Q. (By Mr. CLARKE.) Since you had this understanding with the Western Union Company in regard to conducting business has there been any increase in the rates to the public?—A. There has been no increase in rates to the public, except, as I stated in the first instance, that there were certain low rates done away with, but there was a much larger number of rates that were reduced at the time that understanding was had, particularly the rates between distant points. It had been ascertained that to undertake to conduct a telegraph business at 10, 15, and 20 cent rates was an absolute loss, and those rates were done away with.

Q. Is it your opinion, therefore, that the understanding has resulted in a benefit to the public as well as to the companies?—A. It has resulted in a very decided benefit to the public in this way. That every man engaged in a business and doing a certain part of his business by telegraph knows that he has just the same rates that his competitor has in his line of business, and that no one has an advantage over another one, and there has been very much less complaint of rates on the part of the commercial public since it was known and understood that uniform rates were established than was true when every man thought he could get an advantage over his fellow if he would only insist upon it.

Q. Then, it is your opinion, founded upon your experience, that the public would be benefited if all discriminations in the transmission of intelligence or the transportation of goods could be dispensed with?—A. That is a very broad subject. I should be glad to see the whole franking privilege done away with; but while it prevails in one direction it is almost impossible that it should not be extended in other directions, and I think it is perhaps a utopian idea to suggest that the whole franking privilege could be done away with.

Q. Have there been any serious complaints on the part of customers who formerly had cut rates since you entered into this understanding to maintain rates?—A. Not since they have come to know that it is an absolute fact and that there is no means of getting around it. Everybody is well contented. At the outset they were rather loath to believe that it was true—that this advantage was not still obtained by competitors.

Q. They all seemed willing to pay if others were to pay?—A. Yes; recognizing that the rates for telegraph service are now very low—much lower than they were before. The tendency all the time is toward lower rates, extending the system of low rates to remoter points.

Q. Do you have any arrangement with the Western Union Company for transmitting your messages over their lines to places where your lines do not run?—A. No.

Q. You do not accept messages except where you have facilities for carrying the intelligence?—A. We do not undertake to accept business for any places not reached by us. If a customer comes to us and offers a message for a Western Union point, we do in some cases accept the service as his messenger to take it to the Western Union office, and pay for it just as he would. We are in that case simply the messenger of the customer to take the message to the Western Union office. That is not a business which we undertake to do except for the convenience of our customers.

Q. In cities do you telegraph his message to their office, or do you send it by messenger?—A. Send it by messenger. We have no means of connecting by wire with Western Union offices.

Q. (By Mr. LITCHMAN.) Is there a community of interest between your company and the Western Union?—A. No, except as I have explained to you. The only community of interest is that both recognize that rebates, excessively low rates, and things of that kind can not be afforded, and both companies have abandoned them.

Q. I have seen it stated in the public press that there was an understanding between managers of the two companies which resulted in the operation of them practically as one company.—A. I have found it best not to believe everything that is in the newspapers. The statement you mention is not true.

Q. (By Mr. CLARKE.) In what relations do you stand to railroad companies along whose lines your lines run?—A. We have contract relations with but very few railroad companies. We own lines on a few railroads, and we have contract relations in a limited sense on a few others, and we perform reciprocal service for a few railroads that we have no contract relations with, as a matter of mutual convenience and out of courtesy; but our relations with railroads are limited.

Q. Are any railroad station agents agents for your company?—A. In the cases of a few railroads. The railroad contracts apply to the Western Union Company chiefly under old-time conditions, when the railways and telegraphs were being built up in the early days.

Q. Have you any contracts with railroads which give them business preference over that of the public?—A. There are usually on railway routes certain wires assigned to railway purposes, of which the railway companies have exclusive use, and they give preference to messages referring to the movement of trains. The intention is that commercial business should occupy its own wires and the railroad service occupy its own wires.

Q. When there is an arrangement of that kind, are there other wires over which public business can be sent?—A. On railroad routes?

Q. Yes.—A. I do not know of any railroad route—I do not think of any now—I do not think there is any that has not commercial wires as well as railroad wires along the route.

Q. Have you ever received complaints from the public that their messages were neglected, or have you ever given as a reason for any delay in the transmission of a message that the railroad business had to take precedence?—A. I do not remember any such instance.

Q. Have you in your telegraph experience, before you became connected with this company, any knowledge that such a condition existed or had existed?—A. Undoubtedly in some cases during an interruption of lines or wires, railroad business has been carried by commercial wires to some extent. I do not remember ever to have had a complaint on the part of the public that business was delayed or injured by reason of that fact. In practice I know it has happened to a limited extent; in case of storms, for instance, when part of the wires were down and business was compelled to be done on a single wire or two wires, and the movement of trains requiring the use of wires, the commercial business has had to wait. That is a rare occurrence.

Q. One witness before us testified that he sent a dispatch from New York to Philadelphia and that he arrived at Philadelphia that day, and when he arrived he found his dispatch had not been delivered, and that it came in long after he had arrived. How can you account for such delay between two such cities, where the telegraph facilities ought to be very ample?—A. That might be accounted for in a great number of ways. The message might have lain in the Philadelphia office through some oversight for a long enough time for a train to go from New York to Philadelphia before anybody discovered it. Such accidents do happen sometimes. There might have been such an interruption of lines over the particular route where the message was assigned that it was delayed. There are a good many ways of accounting for the delay. In every case of complaint of that kind we have to investigate and find out exactly what did happen to the message.

Q. (By Mr. FARQUHAR.) Have you any rule of precedence in respect to dispatches that Government business shall go first, for instance, and railroad business next, brokerage business next, and the public next?—A. No; there is no such regulation. Just as you stated, Government business under the law is entitled to go first. There is no other regulation or order of business except such as might be instituted by a chief operator for an emergency on account of the condition of wires. There is no general rule on that subject.

Q. Are the stock and brokerage dispatches liable to get the right of way over ordinary business?—A. A very large proportion of stock exchange and brokerage business is done over wires that are assigned to that purpose; that is, they are leased. But there is no arrangement or engagement on the part of our company that such messages shall have precedence over those of any other persons.

Q. Can brokerage companies lease a wire as cheaply as a newspaper?—A. That depends on conditions—on the extent of the service to be done and the connections to be made. What we aim at is to provide a uniform rate between stated points under equal conditions. The rates are uniform to that extent; but that there is no difference in rates under any circumstances I would not say. When there is any difference, there is a business reason for it.

Q. When brokers advertise their own wire, is there more than one broker on the line?—A. Sometimes; sometimes several brokers lease a wire, and they each have their own operator and connection and they take care of the operating service

altogether. The telegraph company simply furnishes the wire and battery and keeps them in order, and the brokers carry on the business themselves.

Q. Both for the sending and receiving end they have their own employees?—A. Yes.

Q. (By Mr. CLARKE.) How many people has your company in its employ?—A. Nearly 9,000.

Q. Are they all of one sex or are both sexes employed?—A. We have a great many females employed as operators and clerks; not a large proportion of the whole, but still a good many.

Q. What are the rates of wages paid?—A. The wages vary according to the work to be done, the nature of the work, and the service rendered in a variety of ways. The salaries of operators range from \$25 to \$85 per month, the average being about \$60. The salaries of clerks average somewhat less.

Q. Are you able to state in this connection whether or not wages are substantially at the same rates they were a few years ago, or have they been increased or decreased?—A. I think there has been little change in the rate of pay to telegraph operators either way, on an average, for the last 15 years.

Q. Are you able to state in this connection how the wages compare with wages for skilled labor in other employments in the same places?—A. There are so many different kinds of skilled labor that really bear no relation to the telegraph service that I could hardly answer that question intelligently.

Q. Is your labor organized?—A. There has been quite a number of organizations. I do not know whether there is an existing organization that is operative now. A number of organizations have been instituted and exercised for a time considerable influence but if there is any in existence now I do not know of it.

Q. Is there any understanding between your company and the Western Union that each will not hire away the other's help or take help from the other?—A. No.

Q. Is it a matter of common practice that telegraphers go from one company to the other?—A. Sometimes. I think that is regulated altogether by supply and demand.

Q. Have you had any labor difficulties recently?—A. Not recently. We have not had in our own company any difficulty of that kind.

Q. Are your engagements made with your operators singly or through committees?—A. Singly.

Q. Do you inquire whether or not they belong to a union before you engage them?—A. No.

Q. Do you know how the rates of wages paid by your company compare with those of the Western Union?—A. I think they are very nearly uniform for the same service. I do not know of any difference. There are several classes of operators.

Q. Can you tell us about the hours of labor of your employees?—A. Yes; there are established hours for day and night service. In the principal cities 9 hours is accounted a day, and at night 7 hours. This varies somewhat in different localities, and in the smaller offices and branch offices the hours of duty are arranged with reference to the necessities of the case.

Q. Has your company kept abreast with the march of invention and brought into use the new and useful devices in telegraphy?—A. It has endeavored to do so to the fullest extent.

Q. It has been frequently asserted by the advocates of Government ownership that it is not in the interest of private companies to take in new devices that would mean the displacement of the old, in which they have large investments, and that therefore the service is not conducted in the most economical way or to the best advantage of the public. What have you to say to that?—A. That is not true so far as our company is concerned and so far as my experience goes. There has never been a time when we would not very gladly have availed ourselves of anything that was a real improvement upon our manner of transmission or reception of messages, or otherwise in the conduct of the business. A great many so-called improvements have been presented which have had apparent advantages, but which, when brought into actual practice and into competition with appliances already existing, have been found wanting.

Q. Have you studied the operation of the telegraph system of Europe under government control?—A. Only in a general way; not to such an extent as to make it competent for me to testify in respect to it.

Q. Do you see any objection to the acquisition by the United States Government of all the telegraph lines in this country, provided they are taken at a fair valuation? I mean, do you see any objection inherent to the business itself whereby the public would not be as well served as by the several companies?—A. I know of no reason why the Government might not conduct the business as

well as it can be done by corporations. Whether the Government would conduct it as well is another question. Judging from the excellence of the mail service and from the fact that the Government could conduct the business more cheaply, perhaps, in some respects than corporations can, in the Post-Office Department, and in the absence of incentive to earn dividends, possibly it might be that the Government could carry on the telegraph business effectively to the satisfaction of the public.

Q. Have you any knowledge that would justify you in expressing an opinion as to whether the European governmental ownership and control is successful from the point of view of public accommodation?—A. I can only state that on information and belief, because I have not come directly in contact with it. I know some of the officers of the telegraph in Great Britain, and I have had the testimony of business men who have traveled much abroad, and I believe that the business carried on by the Government there is generally quite acceptable to the public. It is not profitable to the Government, so far as I know.

Q. Is it conducted for profit, or is the governing principle to render the public the most service?—A. I think the latter is true.

Q. If this Government were to take over the telegraph systems, are you prepared to indicate what would be a proper basis of appraisal of the property?—A. That is too serious a question to answer "off hand."

Q. It has often been said that the Western Union Company has been grossly overcapitalized. I will not ask you your opinion about that, but I will ask you if there is telegraph property which has cost money in the form of contracts, franchises, privileges, etc., which can not be classified as tangible property, either real or personal?—A. Property of that kind enters very largely into the telegraph, and has not only cost money, but is indispensable to the conduct of the business.

Q. Is it your opinion, then, that if the Government should ever take over the properties, it ought, in justice and equity, to appraise such properties at a fair value?—A. I do not see how it could fail to do so if it proposes to do equity. The intangible properties as well as the telegraph lines have cost money not only, but they have cost large sums of money, and they have accomplished a vast amount of good; they have made practicable the conduct of business that without them would not have been practicable.

Q. Would the cost of reproducing lines and instruments and offices by any means measure the entire cost of the telegraph systems of the country?—A. No; it would come very far short of it.

Q. If the Government were to acquire the properties, in your judgment as a practical telegraph man, should it be done by degrees or all at once?—A. It seems to me the wise course would be to exercise very great care and take all the time necessary for it, to have a very complete organization, and then have the change take place simultaneously. It seems to me that would involve the least interference with business and would be the best manner of proceeding, by all means.

Q. Do you think it would be practicable to introduce the telegraph into many country post-offices and have both the mail service and the telegraph service performed by the same force?—A. I know of no person who it might not be done.

Q. If that could be done, would it result in a considerable saving in the expense of operating the telegraph?—A. Undoubtedly so.

Q. (By Representative BELL.) About what proportion of the business does your company do in the United States?—A. The number of messages transmitted by our company last year was about one-fifth of the whole—a little more than one-fourth as many as the Western Union.

Q. And the majority of your stations have competition?—A. Yes.

Q. With the Western Union?—A. Yes.

Q. Now, where is the necessity of having two companies doing business at the same point?—A. We shall have to define the word "necessity," I think.

Q. Well, is it good economy?—A. Of course the business could be done more cheaply under one management; but the difficulty about that has been hitherto, when the whole telegraph business has for a time been done under one management, that new competition has sprung up of a wasteful sort, and legislation has been instituted against telegraph interests. Public clamor has been raised against monopolies, and it has not so far been practicable to maintain a single service for any considerable time.

Q. Does it not strike you as very expensive economy that we must burden a community with two lines in order to get a reasonable rate, or with two railroads, or a duplication of anything else in the same line? Is not that a waste, in your judgment?—A. It would seem unnecessary, and if we could reach a utopian condition of things it would be unnecessary. Business is no doubt better done under competition.

Q. Would not a strict Government regulation be more reasonable than to burden a community with a new line to reach the same purpose?—A. If the Government owned the entire property and carried on the whole business itself, for the benefit of the whole people, it might be done.

Q. Could the business not be regulated by statute without taking the whole system?—A. If it should be regulated by statute, would it not be necessary to provide, in order to accomplish the economy, that there should be, for instance, only one office in a particular town?

Q. I do not know that that is necessarily true; but it has always occurred to me that the idea that you must bring in a parallel railroad or a parallel telegraph line in order to reduce the rates is a contradiction in itself, because the people must pay the expenses of both.—A. Hitherto the people have not been willing to rest—the commercial public have not been willing to rest—under a single management of the telegraph.

Q. Has not that been because legislatures and Congress have neglected to thoroughly regulate?—A. I can not say. The thorough regulation of the business under competitive conditions by Congress would be an exceedingly difficult matter, I think, without doing serious injustice.

Q. You think the better way would be Government ownership?—A. Government ownership would simplify the case very much.

Q. In European countries my remembrance is that their rate is about a cent a word.—A. That depends; it is not universally so. In European countries the distances are very short in comparison with ours, and, besides, in European countries every word is charged for. Here the rate is upon the message itself. The date, address, and signature are not paid for.

Q. Have you ever made a comparison to ascertain the proportion that part of the telegram we do not charge for would be to the whole?—A. The computation has been made some years ago in answer to a committee of Congress, and the figures obtained at that time are in existence. We have not the telegraph tariff rates of European governments, and I can only say that I have repeatedly been informed, both by telegraph officers abroad and persons using the telegraph there, that, taking into account the fact that all words are charged for by foreign governments, and that the distances within the limits of European countries are much less than in the United States, rates there are nowhere lower than here, and in case of messages going from one country to another they are much higher.

Q. I notice the reports state now that in the little country of New Zealand, that is now attracting so much attention, in each railroad station building they have a railroad station, a telephone station, a telegraph station, and a savings bank in the same building, under the same management. Do you think such an arrangement would be feasible in a country like this, where things are on so much larger a scale?—A. That is a great question; I would hardly feel myself competent to testify on that point. That is a degree of concentration that would depend so much upon local conditions that I think a man would have to be an expert in all those kinds of business, as well as a statesman and political economist, to decide it.

Q. There would be no question but that you might distribute the offices in the same building?—A. Of course, for the public convenience, you can have those kinds of public service done in one central point. I think that could be so; but whether they could be done under one management just as well is a question I am not able to answer. I think that would have to be tried to be proved.

Q. You spoke of your dividends being four per cent; is that upon the actual investment?—A. There are no dividends. The 4 per cent is the interest upon the bonds that were issued.

Q. And do you figure the amount of your earnings that you put into extending lines, or is your 4 per cent beyond that?—A. The 4 per cent is paid upon the \$20,000,000 of bonds. Any earnings beyond that amount are invested in extensions and new construction.

Q. How does the earning capacity of your land lines or of land lines generally compare with the earning capacity of your cable lines or of cable lines generally, taking into account the expenditure?—A. The Commercial Cable lines up to this time have the advantage over the land lines.

Q. Now, relative to your franks, is it not your judgment that for the good of the morals of both sides they should be prohibited? That is, are you or are you not driven to giving franks by men applying for them? Do you not think the prohibition, outside of the equality in the service, would help the public morals?—A. That is a moral question that might have many sides to it.

Q. The frank is an incentive to the public man, is it not, to stretch his conscience a little in furnishing you facilities when you want to get into a municipality—to shirk his duty to you and to the public? And haven't you got to meet

the demand? It seems to me that it gets up a kind of rivalry.—A. I suppose public men should be so strong that they are not to be influenced by such means.

Q. (By Mr. LITCHMAN.) Do you think these privileges would be given if it was not expected that a quid pro quo would be rendered in return?—A. I think the principal feature of the franking privilege is reciprocity.

Q. (By Representative BELL.) If it did not pay it would hardly be exercised, would it? It must be a benefit to the company?—A. It is one of the things that began with the business and has continued the same as with the railway service.

Q. And the evil grows?—A. And it is a practice that grows.

Q. The same way as the railway pass; the company itself seems to be unable to handle it. I suppose that your company or a railroad company would appreciate anyway that you could get out of it?—A. I have already expressed my individual judgment that it would be much better if there were no free privileges. I would much rather pay my own way than to have a pass, provided the rule could be made universal.

Representative BELL. I think the generality feel the same way.

Q. (By Mr. KENNEDY.) You said the tendency was to cheaper rates all the time. Can you say what the average reduction per word or per message of a given number of words has been in 10 or 15 years?—A. In 1880 the rate between the Atlantic and Pacific coast was \$1.50. It is now \$1. Rates between many points of the Northern and Eastern States, to and from many others in the Southern and Western States, in 1880 were 75 cents and \$1. They have since been reduced to 50 cents and 60 cents, respectively. Many 50 and 60 cent rates of 15 and 20 years ago have been reduced to 40 and 50 cents, and many rates of 40, 35, and 30 cents have been reduced to 30 and 25 cents, while the limits within which the lower rates apply have from time to time been extended. The tendency toward a reduction of rates of late years has been brought about largely from the disposition to reduce the number of different rates and to extend, for instance, the limits within which a rate shall be 25 cents, the limits within which it shall be 35 cents, and 40 cents, and 50 cents, until now the highest rate existing in this country is \$1, and comparatively little business is done at that rate; it is between extremes of the country. But there are much fewer rates than there were; they are getting toward uniformity.

Q. (By Mr. LITCHMAN.) Is the rate fixed on what is known abroad as the zone system?—A. Yes; it is somewhat similar. It is fixed through squares, as they are termed. The whole country is districted into squares, and the rate is made from one square to another square, and the manner of arriving at it and giving instructions is in that way. It is a method of simplifying the way of doing it. It is no small task to make a tariff from 20,000 offices to 20,000 offices, and there are more than 20,000 offices in telegraphic communication.

Q. (By Representative BELL.) You spoke of your general agreement with the Western Union to avoid the cutting of rates. You do not mean by that that you put an unreasonable rate on and thus destroy what the world harps on so much as free and unobstructed competition?—A. We have sought to make the rates not only reasonable, but just as low as the business could be well done for. We have tried not to interfere with the efficiency of service.

Q. But at the same time you cut off competition?—A. Cut off competition—you mean by the understanding?

Q. By this understanding.—A. No; the competition is quite as sharp as ever.

Q. That is, you do not compete on the power to reduce rates?—A. We do not compete by buying business.

Q. It would not be buying business if your competitor would reduce the rates below you?—A. Yes; he buys the business by offering the difference between our rate and his.

Q. Yes; but that is competition itself.—A. I see.

Q. And therefore you destroy this free competition?—A. That is simply destruction.

Q. I admit it, I admit it, and I do not believe in it myself.—A. That is destruction. Let me show you how it operates. Of course, you do not need to be shown, but I want to explain it. One or the other has got to go under. Now, between the Western Union and the Postal, which are the principal telegraph factors in this country to-day, if the Western Union reduced the rate from here to New York, which is now 25 cents, to 20 cents, the Postal Company would have to do that at least, and, if it were a question of getting the business—"buying the goods," as I claim—we would probably have to make ours 18 cents, and they would make theirs 18 or 17, and we would make ours 15 or 12 or 10.

Q. Which would result in the survival of the strongest.—A. Certainly; it is inevitable.

Q. Is not that true in all business?—A. The law of gravitation is not any more certain.

Q. And that the higher commercial instinct now is dispensing with unobstructed competition in every line of business?—A. It is the only way to properly protect invested capital.

Q. Does not that also destroy the theory that you make lower rates by bringing in competing lines largely?—A. No; I do not think so. If we bring in competing lines, it enables us to do business on better terms. It has done so in the past, when there were quite a number of lines brought in by one or the other of the larger companies. By removing that competition which has been wasteful in its nature, we have been able to do the whole business cheaper than the whole business was done before.

Q. And yet you had the fixed expenses of two companies?—A. When there are two.

Q. The people bear the whole burden?—A. Yes.

Q. It seems to me that that is a contradiction within itself—that two companies can do the business cheaper than one with all those fixed charges.—A. I have not said that two companies could do it cheaper than one.

Q. I know; but the theory of the world is that you must have two companies, two railroads, two telegraphs. I say that there must be a legislative regulation of the one so that it will not charge so much.—A. The telegraph is entirely different from the railroad in this: The telegraph line represents comparatively a small investment in any particular locality, but it covers an enormous territory, extending throughout the whole country, and its service must be instant in order to be satisfactory. A great many people suppose that all that is necessary to do to get a telegram from here to San Francisco is simply to deposit it in the office here and then as quick as that [snapping fingers] it is in San Francisco. It is impossible to do that. It is a very different service. It requires a series of connections, and separate repetitions for telegraph transmission between remote points. Telegraphic transmission is every letter by itself, every punctuation mark by itself.

Q. Yes; I only refer to that because it presents the principle so strongly and gives it in all its grossness.—A. But you see there is a very distinct difference.

Q. (By Mr. KENNEDY.) You stated your number of miles to be how many?—A. Twenty-six thousand and forty-two miles of route. If we have 20 wires, and the distance is 40 miles, the wire mileage in that case is 40 times 20. Our total wire mileage, as I stated, is 169,236.

Q. Have you figures showing the first cost of putting up the telegraph per mile, and then the subsequent cost of stringing wires?—A. No; you might as well ask what it costs to build a house as what it costs to build a telegraph line. I have known very good single-wire telegraph lines to be built for \$150 per mile, and I have known single miles of telegraph to cost \$10,000 under ground. In some sections of the country the expenditures for poles and wires and transportation and all that sort of thing are comparatively light, and a line can be built across the country at comparatively small cost. In other sections it costs very heavily to build the same character of line by reason of transportation, scarcity of timber, etc.

Q. Did the telegraph companies oppose the enactment of the law for putting the wires under ground in large cities and resist it?—A. I think there has been some change of sentiment on the part of the telegraph companies in respect to that, and that in the main the telegraph companies are rather desirous of putting their wires under ground under recent conditions in very thickly settled portions and the business portions of cities and towns. It is done to a very large extent now, and it has many advantages to the telegraph companies as well as to the public. Of course it is a very expensive thing to do, and when it was undertaken to be done at the outset, and forced through regardless of consequences and regardless of method, and before methods had been worked out for the successful doing of it, there was a great deal of opposition on the part of the telegraph companies; but as methods have been devised for doing it successfully, and as municipalities have been more reasonable in their exactions, it has come to be done more generally.

Q. (By Mr. A. L. HARRIS.) Is there any uniform rule for valuing telegraph property in different States for taxation?—A. No; I wish there were.

Q. Generally, how do the different States get at the taxation now?—A. It is done in almost as many different ways as there are States.

Q. Have you anything to recommend in the way of general legislation for the valuation and taxation of telegraph property?—A. It seems to me that the best way of arriving at the taxation of telegraph property would be to make a single assessment on the whole telegraph property within a State, and then have the company

pay the tax to the State on the whole property and the State distribute it where it belongs. If that plan could be generally adopted, it would be a great blessing to the telegraph companies and would be just as well for the public; but in many cases there is a tax on the capital stock, there is a tax upon the franchise in the city or town, there is a highway tax, there is a tax upon gross earnings, a tax upon net earnings, and all sorts of taxes; a tax on each pole, a tax of so much per mile of wire. All sorts of schemes of taxation are resorted to in different sections, and it makes that branch of our business one of the most difficult to conduct.

Q. You have to pay taxes then in almost every county and town in which your lines run?—A. We pay taxes everywhere, so far as I know; but, so far as I know, the telegraph companies do not object to paying taxes if they are to be taxed within reason, like other people; but they are generally not taxed within reason; they are very outrageously taxed in many places. By reason of the inclination of the States, cities, counties, towns, school districts, and even country municipalities to tax telegraph companies in every way possible, the taxes levied have become one of the most serious menaces to the success of a telegraph company. There is a particular hardship in the levying of license fees by municipalities on telegraph companies, inasmuch as these license fees are either a lump sum, in which case they bear unequally and unjustly upon a small telegraph company as compared with a large one, or these license fees are in the way of a fixed charge per annum for each pole and each mile of wire constructed on the streets and highways, and in that case the tax is unequal and unjust and discriminating as against a telegraph company that has to construct its lines on the highways, as the Postal Cable Company does, as compared with a company that is able to construct its lines on railroad rights of way, as the Western Union Telegraph Company does for the most part.

Q. Will you give the gross amount which you pay in taxes?—A. It is impracticable to give this amount with any accuracy, inasmuch as there are nearly forty separate corporations in which the postal-telegraph system is interested, directly or indirectly, and some of these companies in some of the States pay taxes as taxes, while others pay what is equivalent to taxes in the way of license fees, and I find also that there is considerable litigation pending in regard to the validity of some of these taxes and license fees, and that it is impossible to give with any accuracy the amount of taxes paid by the postal-telegraph system.

Q. Could you give your mileage in the different States and the amount of taxes you pay in each?—A. My answer to this has to be the same as my answer to the last previous question.

Q. The object I had was this, to see where one State was getting the advantage of another State and putting a burden on the others.—A. The chief object of each State seems to be to get the advantage of the telegraph company, and not to get the advantage of another State.

Q. (By Mr. FARQUHAR.) You stated, when asked about European rates, that they were about the same for equal distances. That is, where the Government owns the telegraphs, the European rates were about the same for equal distances as they are in this country.—A. No; I said it was my impression that the rates were lower for equal distances in this country than they are there, taking into account that they charge for every word, while we charge only for the body words in a message.

Q. Have you any means in your head office in New York to furnish this commission with the rates of these European lines that are owned by the Government?—A. I shall not be able to furnish this information.

Q. (By Mr. LORIMER.) Can you tell how the salaries of the telegraphic employees in Europe compare with those of the American employees?—A. We have no information at hand about salaries paid to telegraphers in Europe, except in Great Britain. The conditions of service in America and Great Britain are so different that it is difficult to make a comparison. The mere inspection of the figures is apt to be misleading. In America a young man of good conduct and of skill commands a first-class operator's salary very early in his career. In Great Britain the youth having acquired a fair amount of skill is appointed at a salary of about \$4 per week, and so long as his conduct is satisfactory and he develops ordinary skill as a telegrapher he receives regular annual increments, until he arrives at a maximum figure for a first-class operator of about \$65 per month. In considering salaries paid to the British operator, it must be remembered that at the age of 60 he is retired on a pension.

Q. (By Mr. FARQUHAR.) What proportion do the salaries of the operatives of your lines bear to your total bill of expenses in operation?—A. The salaries paid for all classes of service form a very large percentage—the one great item of expense indeed. It is approximately 70 per cent of the whole.

Q. (By Mr. LITCHMAN.) Do you keep any record of the personnel of the people employed as between men and women?—A. Yes; it is not far from 80 per cent in principal cities, and 25 per cent in the whole country, of female service.

Q. Are the same wages paid for the same service whether it is a man or a woman that does it?—A. We intend that a woman who is able to do just as good work in every way, and is just as useful to the company, shall be paid as well as a man; but it does not often happen. There are limitations to female labor. We can not send a woman on an emergency to perform service all night in the country in case of a railroad wreck or in case of other exigencies, and there are comparatively few women who are as skillful as men as operators, nor are they all as regular in their attendance. The aim is to pay them what they are worth. I do not think there is any discrimination in regard to sex—none is intended.

Q. In your general commercial business, where men and women are employed, how does the rate of wages compare?—A. In our commercial business?

Q. You gave an illustration a moment ago about the railroad business. Now, I am speaking to you about your general commercial business.—A. When a woman is able to work as heavy a wire, as we call it, as a man, I think there is no discrimination.

Q. I have noticed in most hotels that the operators are women. Has that always been the case?—A. I think that has been generally true for the last 15 years particularly. The practice has been growing; it has been increasingly true in offices of that kind. Hotel offices are branch offices having comparatively light business, most of them, and working short wires in connection with the main office in the city or town. It is a very different thing to work a wire of that kind from what it is to work a wire from Washington to Chicago, which is crowded all the time.

Q. You have women employed in the main offices, have you not?—A. Yes; generally working city wires and short wires and performing service that is less exacting and less skillful than that performed by the men.

Q. As a general matter, is it not true that the wages paid to the women are less than those paid to the men?—A. Yes.

Q. The excuse you give for that is that the labor is not as severe?—A. Where the woman is called upon to do the same work the compensation is equal, but it seldom happens that she is able to do it.

Testimony closed.

Whereupon at 1.15 p. m. the commission took a recess until 2 o'clock.

WASHINGTON, D. C., March 14, 1901

TESTIMONY OF MR. THOMAS F. CLARK,

Vice-President Western Union Telegraph Company.

The commission met at 10.55 a. m., Mr. Clarke presiding. At that time Mr. Thomas F. Clark, vice-president Western Union Telegraph Company, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Please give your name and post-office address.—A. Thomas F. Clark, 195 Broadway, New York.

Q. What is your official relation?—A. Vice-president of the Western Union Telegraph Company.

Q. The commission will be pleased to have you proceed in your own way to testify upon the general subject of the telegraph and its relations to the public; and questions will be asked after you shall have finished, unless it should occur to some commissioner to be important that one should be asked as you proceed.—A. I think I would rather have it that way, because the subject will come out a little more in proper sequence than if questions are asked right along.

Now, as I have read the evidence that has been given to the commission in favor of Government ownership of the telegraphs, that evidence has been chiefly based upon the conditions of the telegraph in Great Britain and Ireland and in Switzerland and Belgium. I think, therefore, that before we go into any details it would be better for me to point out the disparity of those comparisons, in order that the peculiar conditions of the telegraphic situation in the United States should appear divested of any mistaken relation to other systems that are of a different extent and which are operated under entirely different social, political,

and physical conditions. I have therefore brought with me two maps. This is a map of Europe [witness indicating map]. The two are practically on the same scale. There is Switzerland [indicating]. The area of Switzerland is 15,981 square miles, or about one two-hundredths of the area of the United States. Belgium has an area of 11,373 square miles, which is one two-hundred-and-sixtieth the size of the United States. Great Britain and Ireland have 120,678 square miles, one twenty-fifth of the size of the United States; the area of the United States, exclusive of Alaska, being 3,092,679 square miles by the census.¹

In Great Britain the population is about 333 inhabitants to the square mile. In Belgium it is 588. In Switzerland it is 183. In the United States it is about 24. Perhaps I would better give the mileage of telegraph in operation, since I have given the extent of these countries now. There is in Great Britain 308,436 miles of wire, or 43,507 miles of line. In Belgium there is 3,964 miles of line and 20,752 miles of wire; in Switzerland, 4,439 miles of line and 13,100 miles of wire. In the United States the Western Union Telegraph Company has 192,705 miles of line and 933,153 miles of wire. Of course, in addition to the Western Union Company, there are the Postal Telegraph Company and some subsidiary companies connected with it, of which that company gives me the mileage, which is 20,882 miles of line and 184,333 miles of wire, which makes altogether in the United States 222,587 miles of line against 425,600 miles of line in all Europe, according to the latest statistics of the international bureau at Berne, and 1,118,086 miles of wire in the United States as against 1,585,267 miles of wire in Europe. Now, comparing the mileages of wire to population, we have 1 mile of wire to 130 people in Great Britain and Ireland; 1 mile to 321 people in Belgium; 1 mile to 222 people in Switzerland, and about 1 mile of wire to about each 76 people in the United States.

You will please bear in mind that the system of the United States covers the whole country, reaches every important center from New York, on the Atlantic, to San Francisco, on the Pacific, and that in order to reach these places it is necessary for the wires to cover large unproductive territories, where the cost of construction has been exceedingly high and where the cost of maintenance is relatively higher than it is in more thickly settled places. This is shown by the fact that of the Western Union Company's wires two-thirds, or about 600,000 miles of them, are in operation east of the Mississippi River, and one-third of the whole mileage is spread over the large unproductive territory west of the Mississippi in order to reach the small towns and camps and places along the various lines of railroads to the Pacific coast. As a foil to these conditions I quote a statement made recently of the population surrounding Manchester, in England. In a radius of 10 miles there are 3,000,000 people, and within a radius of 50 miles there are 8,000,000 people. That is Manchester; what the population surrounding London and other large centers of England in similar radii will be I do not know, but there is almost a case of confluence of populations, making almost one densely settled territory, while we have hundreds and sometimes thousands of miles of line where there is scarcely any business at all.

I have had prepared a statement giving the extent of the telegraph service in the United States, which shows the number of places with a population of 1,000 and over in each State, and the number of telegraph offices and delivery and collection connections through telephones in each State. I will read some of it. In the State of Alabama, to begin at the beginning of it, there are 44 places with a population of between 1,000 and 2,500 each. These figures are taken from the last census—not the present census, because that is not completed and we could not get access to it. There are 10 places with a population from 2,500 to 5,000 each; there are 8 places with a population of over 5,000. That is, there are 62 places with a population of more than 1,000 people each. Yet in that State there are 405 Western Union Telegraph offices, and there are 116 telephone connections with remote and small localities for the collection and delivery of occasional messages, making in all a service covering 546 places in the State of Alabama, although there are only 62 places there with a population of more than 1,000.

I will also give a few examples from the State of Massachusetts, that you may see the drift of the figures. In that State there are 165 places with a population between 1,000 and 2,500, 73 of between 2,500 and 5,000, 79 of 5,000 and over, or 317 with a population of more than 1,000. There are 405 Western Union telegraph offices and 355 telephone connections for the collection and delivery of messages, making 860 places served in the State.

¹ See Exhibit A for statistics concerning telegraph lines in foreign countries.

In Pennsylvania there are 249 places with a population of 1,000 to 2,500, 92 of from 2,500 to 5,000, 84 of 5,000 or over, or 425 in all, with 1,566 Western Union offices and 707 telephone connections, or 2,585 places served by telegraph. Now, we will go to the far West.

Q. (By Mr. LITCHMAN.) Right there, Mr. Clark. That enumeration of course includes the stations in large cities, like Philadelphia?—A. Only 1 office for each city is included. There are no branch offices included in this statement at all. In New York we have, say, 250 branch offices, but they are not included; it is simply the one place.

The State of Washington has 22 places with a population of from 1,000 to 2,500, 7 of 2,500 to 5,000, 7 of over 5,000; 36 in all. We have 230 Western Union offices and 96 connections by telephone, making 344 in all in the State.

Now, taking those States as to population, Alabama has 35 people to the square mile, Massachusetts has 349 people to the square mile, Pennsylvania has 137 people to the square mile, and Washington has 7 people to the square mile. Here is a State, Montana, with 1 person to the square mile. There are 23 places with a population of from 1,000 to 2,500, 4 places with 2,500 to 5,000, 4 places with over 5,000, 31 in all, yet we have 160 Western Union offices, 103 connections by telephone, or 292 places in all in the State receiving telegraphic service.¹

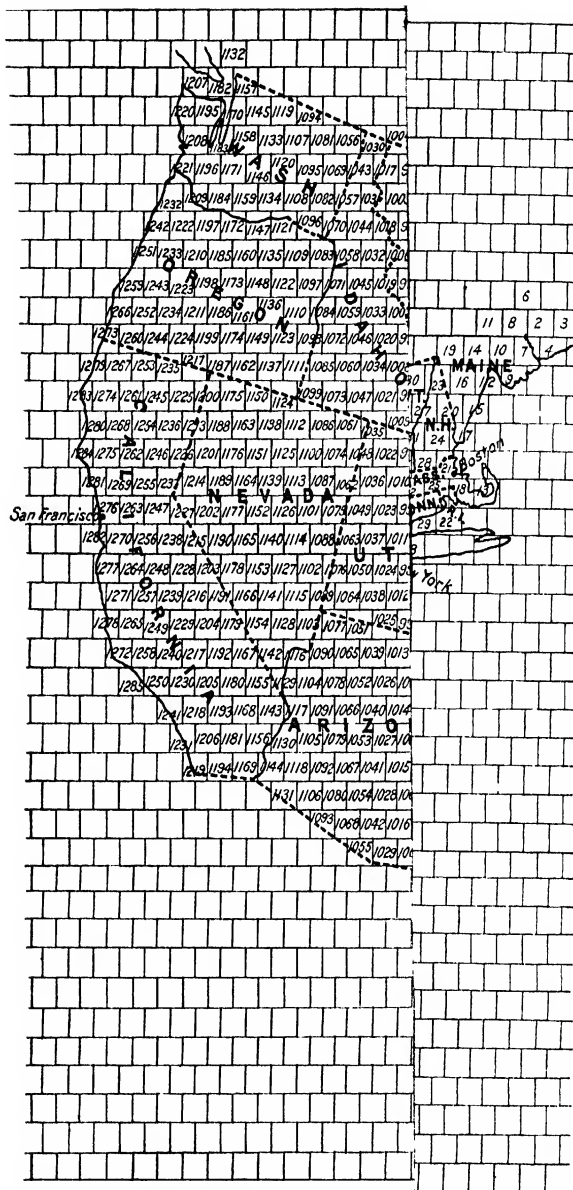

As a further basis of comparison on these points I may say that there are about 59,000 places reached by the telegraph companies and their connections in the United States. There are 76,000 post-offices in the United States. Great Britain has, as far as I can ascertain, about 40,000 post-offices, with 10,816 telegraph offices. Roughly speaking, the telegraph reaches practically 50 per cent of all the places where there are post-offices in the United States to-day, while in Great Britain it still, although the population is so dense and the distances so short, reaches only about 25 per cent of the post-offices.

As I have shown the comparison of the areas of the countries and the extent of the telegraph systems, it may be well to take up the comparison of rates now. I presume that you are advised that the rates charged by each separate Government system in Europe have no relation to the business sent from one country to the other, or what we technically call "through" business. It is quoted to you continually, in the arguments in favor of Government ownership as against private ownership, that the rates in Great Britain and the rates in France and the rates in fact in any European country are very much lower than they are in the United States. That is true to a certain extent for the local business in those countries, but for the through business on distances that compare at all with the distances over which we send business in the United States, the rates in Europe are very much higher. For instance, in all countries of Europe they charge for all words transmitted, for the address, the text, and the signature of the message. In the United States we send the address free and the signature free, and base our tariffs on a count of 10 words for the text of the message. The rate in Great Britain is 12 cents for the whole count of the message, anywhere in the United Kingdom.

Q. (By Mr. CLARKE.) Is that irrespective of the length of the message?—A. No; for 12 words.

Q. Twelve cents for 12 words?—A. Yes; 12 cents for 12 words, and 1 cent for each additional word. In France the charge is 10 cents for 10 words or less; in Norway and Sweden, 10 words or less, about 13 cents, I think it is half a krone; in Germany, 10 words, 12 cents; Belgium, 15 words or less, 10 cents. Now, we find by careful examination, a fair examination of business, that we transmit about 11 words in every message free—that is, of the address and signature—so that on that basis we send for our 25-cent tariff on the 10-word basis—31 words, whereas the interior rate in European countries is made on a basis of from 10 to 15 words, counting everything. To reach a fair conclusion on comparable conditions, I will take the British Government statistics, because they are quite complete and because the British operation of the telegraph generally furnishes the burden of argument with the advocates of Government ownership. From New York to any place in New England our rate is 25 cents for 10 words, 10 text words; that is, 25 cents for 21 words, because, as I have stated, the average on a fair count of a large amount of business shows that we transmit 11 words free, figures counting as words. The longest circuit that can possibly be worked in Great Britain is about 600 miles, but messages sent that distance would represent a very small part of their business. Their principal business is done, of course, between and within the large centers, which are much nearer together than that.

¹ See Exhibit B for the full tabulated statement.

I think that their own statistics show that about 65 per cent of all their messages are sent into and out of London, while the distance of our transmissions varies from a few miles up to 8,000 or over.

Q. (By Mr. LITCHMAN.) In that connection, have you anything in your statistics to show how large a proportion of your work is brokerage and how large is commercial work?—A. No; you can't get at that. It would necessitate an analysis of all the business and of all the messages, and even if we could make that analysis we should hardly be able to determine what was brokers' business and what was ordinary commercial messages, unless we happened to know who the senders were and what their business is.

Q. Does the process of having cipher names and addresses prevail in foreign countries the same as in ocean telegraphy?—A. I will come to that in a minute. I am now talking of the local tariff within each country compared with our rates, how it sums up in comparison with our 25-cent rate within a great many of the States, each State for itself; and from New York to New England, or from New York to New Jersey, or New York to Pennsylvania—25 cents for 21 words. There is not much difference between that rate and the rate in Great Britain, while the circuits used are undoubtedly a great deal longer, because the centers of population are farther apart in the United States than they are in Great Britain.

As to the through business on the Continent of Europe, you can register, if you have any amount of business, a code address as you do in cable messages; but you have to pay \$5 a year for that registration. Therefore, that is a system that is used only by people who have enough business to warrant it. For the telegraph business of the general public—although I have no statistics to refer to—it must, I think, be self-evident that the registration is not used very much, and that the ordinary business passing between any two centers in Europe would be practically on the same basis of count as the business in the United States. Therefore, it is safe to assume that the general business, say, between London and Paris, between London and Marseilles, between London and St. Petersburg, between London and Rome, would be about on the same count as it would be with us. In fact, I think the tendency would be there to make it more, because the names of streets are much more involved than in our numerical system of designating streets in the United States. I ought, perhaps, to repeat here that the rate for all international business in Europe is made on a word count, and not on a count of 10 words or less, or 12 words or less, whatever the number may be, but precisely in the same way as cable business is transacted; that is, each word is paid for. The rate between London and Paris is 5 cents a word for 290 miles, which on a fair basis of 21 words to the message would be \$1.05, whereas you could send the same message from New York to any part of New England or Pennsylvania or New Jersey for 25 cents. From London to Marseilles, 827 miles, the rate is 5 cents a word; that would be the same as Paris—\$1.05—while our rate from New York to Chicago, about the same distance, is 40 cents. From London to St. Petersburg the distance is 1,774 miles, and the price is 11½ cents a word, or \$2.41 for 21 words, while our rate from New York to Galveston, 1,789 miles, is 75 cents. From London to Berlin is 746 miles, and the telegraph toll 6 cents a word, or \$1.25 for 21 words, while our rate from New York to Cincinnati, the same distance, is 40 cents. From London to Rome is 1,192 miles, and the rate is 6¼ cents per word, or \$1.37 for 21 words, as compared with our charge of 60 cents from New York to New Orleans, 1,344 miles. I could go on and make a large number of comparisons of that kind, but they would give practically the same result, and I do not think it is necessary. I may say, however, that as I notice one of your witnesses disputed the distances on which some comparisons were made once before, that these distances are taken from the Bradshaw Railroad Guide, and therefore I think, if not exact, are practically correct. So much for the comparison of that rate.

Perhaps while we are on the question of rates, I might give you an idea of the character of rates we have. There are the commercial rates, of which the 25-cent rate that I have referred to, of course, forms a part. Those rates are made up in different ways. For instance, in some States they are 25 cents for the whole State. From New York to New England points they are 25 cents. There are also rates from State to State, and there are rates between large centers. The rates for local purposes all through the country are made up by a system of squares, shown on this map [exhibiting the following map]:

The Witness: The whole country is laid out in a system of squares, 50 miles to the square, and numbered, and then the rate is made 25 cents from any square to any 2 circles of contiguous squares.

Q. (By Mr. FARQUHAR.) These red lines designate the—A. (Interrupting.) The State boundaries. Each side of each square is 50 miles. Within a radius of squares the rate is 25 cents.

Q. Who invented that system?—A. I think Mr. Holmes had as much to do with it as anybody. As the business has grown and localities have become more thickly settled, direct rates have been extended, and the square system has been overshadowed by the extension of the flat rate, as in the case of New England, where business and population justify it. The highest rate we charge is \$1; that is from the Atlantic coast to the Pacific coast.

Q. For 10 words?—A. Ten words. All our business is on the 10-word count, with address and signature free. Then we have a system of night rates east of the Rocky Mountains; that is for messages to be transmitted during the night and delivered the next morning at about half the day rate. But we have no rate less than 20 cents.

The press rates are made on a basis entirely their own, and because of the volume of business done and because the larger part of it is transmitted at night. The business of the press associations is largely done over leased wires. The Associated Press has a system of leased wires practically connecting all large centers of the country, which the association uses as it chooses and over which it sends all its business. We have nothing to do with that system except to take our rental for the wires, the same as we do from any private individual. The press rates on matter that we handle ourselves are made on a basis of circuits, by which a large number of papers can be served at the same time, so that economy to each paper can be promoted as much as possible, with due regard to the return to the telegraph company. The special rates to newspapers for a single transmission to one paper are based on what we call "the additional-word rate" of the day message; that is one-third of the additional word rate in the daytime and one-sixth at night, so that where our rate is 35 and 2, the press rate in the daytime would be two-thirds of a cent, and at night it would be one-third of a cent a word for direct transmission and delivery to a single paper.

Then we have rates for commercial reports which are distributed to exchanges and to various subscribers throughout the country. They are made on a basis somewhat similar to the press rates for individual subscribers, in that they name a rate for certain reports that may be desired, especially where they can be transmitted over circuits, so as to give the farmers and the dealers of produce in grain all obtainable information of the markets, in order to regulate the sale of their crops and the getting of them to market. Certain people may wish to have the opening and the noon and the closing reports of certain produce from certain exchanges, and those reports are made up and sent and delivered at those hours over certain circuits as they are called for through the rural districts.

Q. How do these rates compare with the general rates at which you send messages to those points?—A. I can't give you the exact comparison. They are lower because they are made up in one transmission.

Q. Does the Produce Exchange make the arrangements itself?—A. No; we make them. We have an arrangement with the Produce Exchange. That is, we take the quotations from the Produce Exchange and distribute them. They are handed by a regular bureau for commercial news, and, of course, the information is sent between exchanges on arrangements made with each exchange.

Then we have the question of Government rates.

Q. Before you pass from the question of rates to exchanges I wish to call your attention to the fact that a question has come before this commission in respect to brokerage and bucket-shop dispatches and others of that character, it being charged that they had precedence, very often, in the case of an intensive market in stocks. Is there any discrimination made for the purpose of handling money and stocks?—A. No, sir; those statements have been made without any evidence or proof that has ever come to the knowledge of any officials of the company. There is no discrimination permitted in any way or under any circumstances, and if there is any case of that kind that can be charged against the company, we are only too anxious to know it, that the service may be kept on a proper basis. The larger brokers have leased wires. That is none of our concern; but the business that comes to us for transmission is transmitted without discrimination, without partiality, and directly in the order in which it is received, and is delivered in the same way.

I was coming to the question of Government rates. We have a contract, which is made from year to year with the Government for the business of the Weather Bureau. That contract provides that for messages containing not more than 20 words, all words counted except the date, the charge shall be 20 cents, and for

each additional word 1 cent, for a distance not exceeding 1,000 miles. For distances of over 1,000 miles, one-fourth the price of messages for 1,000 miles is to be added for every 500 miles or fractional part thereof. That is the rate for the general messages. For the circuit reports, where we make up circuits and are able to send to a number of places with one transmission, we take their reports and send them for 2½ cents a word over each circuit not exceeding 1,000 miles, with one-half cent per word additional for circuits over 1,000 miles in length, provided that no circuit shall exceed 1,500 miles in length, one-eighth cent per word to be added for each additional drop-copy station.

For all cotton, sugar and rice, and corn and wheat region messages on each day that they are telegraphed, the charge is 20 cents for the first message received at each circuit center and 10 cents for each additional message, no matter where. For the general business of the Government we accept the rate made by the Postmaster-General every year under the provisions of the act of July, 1866—that is, we have done so, except when Mr. Wanamaker made it practically nothing. It has been generally accepted by the telegraph companies. That act provides that the Postmaster-General shall have the privilege of fixing the rates in return for the privileges granted to the telegraph companies under it, such as rights of way through public domain, etc. We send messages, which are practically the same as miscellaneous messages for the Weather Bureau: For night messages not exceeding 20 words, exclusive of place from and date, the charge is 15 cents for any distance within 2,000 miles and for greater distances 25 cents; in each case 1 cent for each additional word. These rates are not made up on any particular commercial basis, nor with the hope or expectation that they will yield the company anything like an adequate financial return for services rendered. In fact, they don't. The company really contributes through these contracts a large sum every year to the Government for its service. I think it might be well, with your permission, to have these two contracts included in my evidence, and so I will leave them with you. [See Exhibits C and D.]

I think now we might pass on to the question of capitalization, which I see is included in your plan. The charge is continually made that telegraph rates are not reduced because the properties are overcapitalized. So far as the Western Union Telegraph Company is concerned, considering the question on the purely business basis of the experience of a large and important industry, which has had to go through all sorts of commercial crises, all phases of discouragement, almost failure, and has resulted in successful service to the country, the rates will compare more than favorably with the rates charged by any system of telegraphs that can be put upon the same basis without the props of government aid and of government support to provide means, without regard to returns annually, to supply very large deficiencies. There is no ground whatever for the charges made by the people who have this idea of overcharges, and I think that they make the charges in ignorance.

The financial conditions of the telegraph systems in European countries are very much obscured by all the returns made, with the exception of those of Great Britain. Her Government has the frankness to acknowledge the absolute financial failure of her telegraph system, and to tell the taxpayers that they are expected to provide a large sum every year to make up for the losses of the system which is used by that portion of the public that sends and receives telegrams. I might perhaps say in the beginning that the total officially reported deficiency of the telegraph system in Great Britain since it was assumed by the Government in 1870 is £7,756,654 10s. 4d., or an equivalent of nearly \$40,000,000.

I should like, with your permission, to have this page of the return relating to postal telegraphs, issued by order of the House of Commons, printed in my evidence as it stands.

RETURN RELATING TO POST-OFFICE TELEGRAPHS.

Statement prepared in accordance with the following paragraph of sect. 4 of 39 Vict. c. 5, viz: "There shall be added to such account a statement of the amount expended during said year on account of the annual charge for the securities created for the purpose of the telegraph acts, 1868 to 1870, and any acts amending the same, and of the surplus, if any, which, after deducting from the said balance the amount of such annual charge, remains as a sinking fund for the redemption of the said securities; and a statement of the mode of application of such surplus."

The losses on the telegraph in Great Britain are provided for by the annual grant made by Parliament to the department. That grant covers all the cost of extensions as well as of operations, and therefore no capital charge is made especially for the telegraph department, and the whole amount, including the interest on the original stock that was issued, goes in as a part of the expenses of the post-office granted by the Government; and no interest charge, since the exhaustion of the original grant of about £10,000,000, has been charged up to the telegraph department, as I understand it, but this is carried either as a charge against the post-office in a general way, or as interest, or as part of the interest on the national debt.

The statistics of the system in Great Britain are as follows: Poles, 43,507 miles; wire, 308,436 miles; capital account, grant of original act of purchase, 1869, including £2,126,000 expended for extensions to September 30, 1873, £10,868,663, or \$52,820,702; expenditures for extensions included in general expenses September 1, 1873, to March 31, 1900, £2,836,000, or \$13,782,960. The total capital account for the lines is \$66,603,662. These figures give an average capital account of \$1,530.80 per mile of poles and \$215.90 per mile of wire. I may say that the above figures for the expenditures for extensions I have learned from official sources, and they are therefore not to be questioned.

As a comparison with this showing we will take, if you please, the Western Union Telegraph Company as it stands to-day. The system of the Western Union Telegraph Company represents: Stock, \$97,370,000; 5 per cent collateral trust bonds, due January 1, 1938, against which bonds and stocks bearing the company's guarantee of interest or dividends at 6 per cent per annum have been deposited with the trustee, \$8,502,000; 4½ per cent funding and real-estate mortgage bonds, due May 1, 1950, \$10,000,000; 7 per cent building bonds, due May 1, 1902, \$1,150,000; stock of leased lines bearing guarantees of the company held by individuals, on which the company pays dividends or guarantees dividends, \$14,334,665; in all, \$131,364,665. The mileage of the system, which I have already given you, includes the 2 Atlantic cables, which should be deducted as not being a part of the system within the United States. Therefore, on the basis of 186,623 miles of poles, the capitalization is \$703.80 per mile. Deducting the Atlantic cables from the wire mileage altogether, leaves 927,071 miles of wire at a capitalization of \$141.70 per mile. In other words, the capitalization per mile of poles in Great Britain is more than twice as much as that of the Western Union Company, and the capitalization of wire is exactly one-half as much more.

There is another view to take of this question to put it on a fair basis, and that is that the company has in its treasury about \$11,000,000 of assets of outside companies that are not telegraph companies and whose systems are not in any way comprised in its mileage. If, therefore, we should deduct those assets from the above amount of stocks, bonds, and outstanding guarantees, the total capitalization is \$120,364,665, or \$645 per mile of poles and \$129.80 per mile of wire.

I have some comparative figures on this question of capitalization with the mileages given to me by the Postal Telegraph and Cable Company to which I have already referred. That company has \$18,000,000 of 4 per cent bonds, and that does not capitalize all that the lines have cost, which is about \$20,500,000. On the mileage given by them in the United States it makes that company's capitalization on \$20,500,000 \$782 per mile of poles and \$121 per mile of wire. You must bear in mind that that company is the result of sundry reorganizations of other companies and has been built up on practically a cash basis.

The capitalization of the Western Union Company has resulted from the amalgamation of a large number of telegraph companies from the beginning. In the early days the country was exploited by small companies in all directions, and they made their own tariffs. If you wished to send a message from one remote place to another remote place you had to do precisely what you have to do in Europe to-day, that is, send it over a number of government lines in order to reach a given point, and pay what to-day we call the transit rate through each country for that particular class of business. The result was, of course, that there was no unification of service. There was no compact way of reaching any point, and it became evident to the managers of the properties that the only thing feasible was consolidation and that consolidation would lead to direct circuits, with tariffs reduced because of unification of management and the obviolation of a variety of individual charges for each system.

I have a memorandum prepared for me by Mr. Holmes of our tariff bureau showing the result of the consolidations. It is exceedingly interesting, and as it briefly states the situation I can not do better than to read it to you. (Reading:)

"Previous to the consolidation of 1866 few of the telegraph companies appear

to have had anything like a system of rates. The rates of the old Western Union were 25 cents for distances, by wire, of 25 miles, and an additional 5 cents for each additional 25 miles, modified according to the judgment of the general superintendent. There was also a system of rates in the Southern States. All of the offices of each company were, however, supposed to know their own rates; and for rates to other companies they added to their own rate the rate of the connecting company from the nearest transfer point.

"Shortly after the consolidation in 1866 the rates from Washington, north and south; from Louisville, north and south; from New York, east and west; Buffalo, east and west; Chicago, east and west; Omaha, east and west, and in various directions from other places, were printed and distributed to all telegraph offices in the United States. By adding the rates of the various lines and companies thus listed, offices obtained their rates for through business in any direction and for any distance.

"The following are some of the rates which were in force from New York in 1866, viz. to Buffalo, 75 cents; to Cleveland, Ohio, \$1.45; to Chicago, Ill., \$2.20; to Omaha, Nebr., \$4.45; Denver, Colo., \$7; Salt Lake City, Utah, \$7.25; San Francisco, Cal., \$7.45; Portland, Oreg., \$10.20; Victoria, B. C., \$11.55; Washington, D. C., 75 cents; Richmond, Va., \$1.25; Atlanta, Ga., \$2.35; New Orleans, La., \$3.25; Galveston, Tex., \$5.50.

"The rates of the East were lower than those in the Middle and Western States, and those in the Middle States lower than those for like distances in the South.

"It was, at the time of the consolidation, impossible to make a uniform scale of rates between the offices of the consolidated companies without cutting the Western and Southern rates down to the Eastern, and therefore to an unprofitable scale, but the Western and Southern rates were nevertheless very much reduced, and the system known as the square-and-State-rate system, by which an approach to uniformity was secured, was adopted. This was in October, 1869.

"The new scale of rates when applied to the business of New York City, which was in the zone of low rates, effected a reduction of 20 per cent. At Western and Southern places the reduction was much higher, and to the Territories of Washington and Oregon and the southern part of California, the high rates were reduced from \$10 and over to \$7.45 and \$6.

"In 1872, 3 years later, new rates were issued and further reductions were made and another step taken toward a uniform scale. In the long-distance rates the maximum was made \$5. In 1873 another revision of rates cut the maximum down to \$2.50, and the rates for maximum distances were further reduced from \$2.50 to \$2, and this to \$1.50, and later, March, 1884, to the present maximum of \$1.

"The rate from New York to Buffalo, which was 75 cents, finally became 25 cents, which is the rate to all other places in New York State; Cleveland, \$1.45, is now 40 cents, which is the rate to all other places in Ohio; Chicago, Ill., which was \$2.05, is now 40 cents; other places, 50 cents; Omaha, Nebr., \$4.45, is now 50 cents; Denver, Colo., \$7, is now 75 cents; Salt Lake City, Utah, \$7.25, is now 75 cents; San Francisco, Cal., \$7.40, is now \$1; Portland, Oreg., Seattle, Wash., and Victoria, B. C., which were from \$10.20 to \$11.55, are now \$1; Washington, which was 75 cents, is now 25 cents; Richmond, which was \$1.25, is now 35 cents; Atlanta, Ga., which was \$2.35, is now 50 cents; New Orleans, La., \$3.25, is now 60 cents; Galveston, Tex., which was \$5.50, is now 75 cents.

"As far as it has been possible to carry it, the uniform scale has been applied East, West, North, and South, and, wherever practicable, the divisions by squares have been abandoned and the rates fixed by States."

So the result of this consolidation of the service and the bringing together of the capitals of the different companies and the unification of the service and making it possible to effect economies, and by and by to reduce rates, has been beneficial to the public in every way. It also put the property on a final basis of capitalization not nearly as high as the capital of the chief exponent of government ownership in Europe, that is, Great Britain and Ireland. Of course, I know that it has been claimed that a large price was paid by the British Government for the lines there. Well, what of that? If a man has a successful business and it is bought out by anyone else, is it to be bought out on the bare cost of the skeleton of his plant? Is there nothing for the ability that has been expended, nothing for the development of the business, nothing for what is known in ordinary commercial parlance as good will? To any reasonable man, to anybody with any business experience, anyone with any political conscience, such a question is absurd and should be dismissed even without the attention I am giving to it now. Our rates as they stand to-day have been devised so as to have them follow the development of the business all the time, and with an earnest desire on the part of the company to keep them as low as is consistent with a proper

return on the capital and provide for the very expensive maintenance of a peculiar property, which is more exposed to deterioration than perhaps any other property in existence.

A great many attempts have been made to radically reduce the rates that have been established by the Western Union Telegraph Company, as a result of its large experience and of its better comprehension of the conditions governing the management and the effect of telegraph properties but, every time that effort has ended in failure. The last really serious attempt was made by the Baltimore and Ohio Telegraph Company, and I think you all know what was the result of that effort. That company had to give up the business, and the Western Union took the property and made it a part of its system. And so it has been right straight along, that a proper regard for business considerations and a proper regard for the capital represented by the company have justified the present rates and made it impracticable for us to do more than follow the development of the business, which we are continually doing, in making the rates reasonable and keeping the service equal to the demands.

Another phase is taken up by the advocates of Government ownership, or by the opponents of private ownership, on some rather curious estimates of the cost of reproducing the property. One gentleman naively says that you can produce telegraph lines at the rate of about \$120 or \$130 a mile. Therefore you have only to take the mileage of the Western Union Telegraph Company, use that figure as a multiplier, and lo, you have got it all; there it is; why, it is next to nothing. You can almost produce a telegraph plant by a sort of Aladdin process without the expenditure of any trouble or any care or anything of that kind.

It is true that you may be able to build under favorable conditions a telegraph line with, say, 2 wires, for somewhere in the neighborhood of \$150 to \$175 a mile. I take those figures as an average; I am not giving the exact sum. But does that constitute a telegraph system for this country? Why, there is only about 30 per cent of the lines of the Western Union Telegraph Company that have 2 wires, I think, and all the rest run up from 3 to 200 wires. Will a plant that will support wires and provide for business in remote rural districts accommodate the business of this country? Look at your lines between here and New York, lines with 40 wires apiece on them. Look at the terminals that are necessary in large cities, buildings that cost millions of dollars, work to connect up the whole system, that, instead of costing you a \$150 a mile, will sometimes cost you thousands and thousands of dollars per mile. In one instance, for 3 miles, it cost us \$100,000 a mile in our underground and pneumatic system between our uptown and downtown offices in New York. These are essential features of the telegraph. It is not the cost of the line out on the prairie, it is not the cost of the line in the woods that can determine the value of the system. The expensive terminal facilities that are necessary in all the large centers to provide the means for collecting, distributing, and handling the business all over the country as it comes through are even larger factors in the question. Therefore any estimate of cost or any attempted gauge of this question by making a calculation on any such basis as these gentlemen have undertaken to make it on is absolutely absurd and should have no credence whatever. The property as it stands to-day represents in a large part several renewals, because the reconstruction of the lines is always provided for before any balance is struck of the earnings for the year; in fact, it must necessarily be so or new capital must be provided. I may say, in round numbers, that since 1866, for reconstruction and general line repairs to keep the property up and in a fit condition for business, there has been expended upon it between \$50,000,000 and \$60,000,000. That is entirely outside of construction in any way, and the result of this is—referring again to the capitalization question, say in 1873—that the capital per mile of wire stood higher by—I can not tell exactly how much, than it does to-day. An additional value is also given to the lines in their reconstruction by the use of much better material than formerly; that is, we are using copper wire now, which is much more expensive than the iron wire was when it went into these lines, and a much more substantial and effective plant is all the time being reconstructed as the old lines go down, without impinging upon any capital account in any way; consequently the rate of capitalization per mile of wire is continually going down.

That is about all on the financial side of the question. I do not know exactly what the other questions are that you wish to consider, but I should like to put in here a remark that was made by the chancellor of the British exchequer, in 1893, in which he said while laying before the House of Commons his annual budget, "That the operations of the British Government telegraphs for the fiscal year showed a 'bad revenue,' and an excess of actual working expenses over receipts of £115,000 (\$360,000), to say nothing of the interest on the £10,000,000 of

stock issued for their acquisition." He also said that since the purchase by the Government of the telegraph lines, including the moderate interest they ought to have paid upon their cost, the loss on that transaction had been \$4,500,000 (about \$2,000,000), "which result was founded on a miscalculation, and, for anything that can be seen to the contrary, it is a revenue which is going from bad to worse, and not likely to improve." His apprehension seems to have been well founded, since the deficit of the present time is about \$40,000,000.

Therefore if that result comes in the comparatively limited territory of Great Britain and Ireland from trying to extend the telegraph system without commercial considerations to remote and insignificant places, what would be the result in this country, which is twenty-five times as large and not nearly so thickly populated, with distances much longer, with territory less productive, and with a public that can not provide the argument for the use of the telegraph that is continually grounded on social questions? What I mean is this, that we are a very busy people in the United States. Great Britain, besides being a very busy, very active, and thickly populated commercial center, is also one of the playgrounds of the world. Take, for instance, the steamer after steamer that goes from the United States loaded with people who are continually sending social messages while they are on "the other side." London is filled with tourists and visitors from all parts of the world at all times of the year. There is also there a very large class of people of leisure who freely use all means of communication for their social engagements, the like of which we have not here in any way. And if the extension of the system to out of the way and remote points is supposed to serve a social need, I doubt whether that social need exists with us as it does in a country like England, while the financial result is bound to be very much more serious to the general taxpayer than it has been, even in England.

Q. You can give the earnings now.—A. I suppose we might as well take last year's figures as found in the report of the last fiscal year, June 30, 1900.

Q. (By Mr. CLARKE.) That is the report of the Western Union?—A. The report of the Western Union, of which I will give you a copy if you wish to have this table inserted. It might be well to do it. Our gross earnings were \$24,758,569.55. Our expenses, gross, were \$18,593,205.87. This left a balance of \$6,165,363.68, of which there was expended for dividends, at the rate of 5 per cent on the stock of \$97,370,000, \$4,867,983.75; for interest on bonds, \$896,305.60; for sinking funds; \$9,797; in all, \$5,774,086.35, which carried to our surplus about \$391,000.

The expenses for the year were made up of operating and general expenses amounting to \$13,220,009.44; for rentals of leased lines, \$1,566,704.65; for maintenance and reconstruction of lines, \$2,959,998.23; for taxes, \$529,469.09; for equipment of offices and wires, \$317,024.46; in all, \$18,593,205.87.

You will therefore see that for the fiscal year 1900 we expended practically \$3,000,000 in reconstruction and maintenance of lines. Of the operating and general expenses for salaries—that is, for direct expenditures for salaries in the transmission and delivery of our business—the amount was about \$9,000,000, or practically 50 per cent of the whole expense. Then there is included in the maintenance and reconstruction item a large amount for salaries for regular linemen, special line gangs, foremen, and general labor expenses.

As to the number of messages, I might say here the report shows that we transmitted 63,167,783 messages during the year. That does not represent the total use of the wires, because we have a large number of wires leased to the press and to merchants and individuals. Apportioning the use of those wires on a very conservative basis would add certainly 7,500,000 more messages sent over the company's system during the year than this number given in the report; but, of course, we can not take note of that business because we do not handle those messages, and I am merely making this statement as an explanation if any comparison on the number of messages sent is made.

Q. (By Mr. KENNEDY.) There are two other subjects in the topical plan, Mr. Chairman—charters of various States and State taxation and supervision.

A. Well, I can very quickly dispose of one of them. We have no State charters at all; that is, except from the State of New York, where we are organized under the general laws of 1848. But as to taxes and supervision, those questions seem to be among the vagaries of the States; they differ in every State in the Union. The total taxes that we paid last year were about \$529,000. That is assessed upon us in various ways in different States. Each State has a law of its own. We think, as a rule, that the taxes are very high, while wishing to pay on fair assessments the same as anyone else. The values that the taxes are based upon are sometimes a proportion of the capital, and sometimes the estimated value of the property. The State of Connecticut makes a charge upon each mile of wire, and in one case, in Texas, I think, a tax is laid on the messages, one cent upon

each message. That law is still in existence, I think. The whole question of taxation is very intricate, being subject to legislation in each of the States, and we try to treat it as fairly as we possibly can, and pay what we think is right on the same basis of valuation as that of other property. I will mention as one of the troubles of such things that a law was recently proposed in the State of New York taxing all authorized capital at the rate of 1 mill and a quarter. That meant \$125,000 per year on the capital of the Western Union, to say nothing of the capital of other companies that it is responsible for, in that State alone, outside of the taxes in all the other States. That law has not been passed. An amendment to it has been suggested and I believe is to be made. There is no uniform law of taxation in the States. Is there any other subject that you think of just now?

Q. (By Mr. KENNEDY.) There is one other large subject that is not included in the plan that I would like to hear Mr. Clark upon, and that is the subject of labor.—A. Well, I do not know that there is a great deal to say on that subject except that we have a large number of employees. There are about 35,000 people in the United States concerned in the handling of the business of the Western Union Telegraph Company, as you know. Many of them are constructive employees of the Western Union Company only. They are the agents of the railroad companies with which we have contracts, and they handle the commercial messages at small stations where the telegraph business is not sufficient to justify the employment of an independent operator or the establishment of an independent telegraph office. But while we do not pay them directly we pay for their services in other ways under our contracts with the railroad companies. Just how many of them there are I could not give you offhand.

As to the general question of operators it is a question of supply and demand, and we pay wages that are satisfactory, as far as I know, to the men everywhere. There is nothing else to say about it. Our wages are higher than they are in Europe, but it is very difficult to say just exactly how much higher because the classifications are entirely different. In Europe, of course, operators come under civil-service rules, and their salaries are not governed so much by supply and demand as they are with us. The telegraphs are administered by the Government service there entirely.

Mr. LITCHMAN. I would like also to ask the witness about the relations between the Western Union Company and the Bell Telephone Company.

The WITNESS. There are no relations between the two companies except that the telephone company collects and delivers messages for us for which we pay it.

Q. Is it not true that there is some sort of a contract, or that there has been some contract, between the Bell Telephone Company and the Western Union?—A. There was a contract, but it expired with the expiration of the Bell patent.

Q. (By Mr. CLARKE.) Is it your pleasure now to explain your relations to the railroad companies?—A. Yes; I can explain that relationship. I do not think there is any objection. Our relations to the railroad companies in a general way are that we construct lines along their roads and give them the use of wires for running their systems, and in return they employ operators who do their own telegraphing over those wires and incidentally any commercial business at small stations for us. We also give the railroad companies the use of our wires beyond the lines of the roads to certain agreed amounts for them to do their business throughout the country generally. That is practically all there is in it. Of course, each contract stands upon its own particular basis, according to the circumstances and conditions under which it is negotiated.

Q. Is there substantial uniformity in those contracts throughout the country?—A. Practically so; yes.

Q. Would you have any objection to submitting one of those contracts as part of your evidence?—A. I should not feel at liberty to do that. There are two parties to a contract, and I do not think I should do that on my own responsibility or the responsibility of the Western Union Telegraph Company without consulting the other parties. That is all there is in it. We issue franks by which the officers of the railroad companies send messages, the numbers of which are noted on the message and entered, and an account is made up and rendered to the railroad company at the end of the month. They also render an account to us of the receipts taken in at their stations for our lines.

At 12.50 p. m. the commission took a recess until 2 o'clock p. m.

The commission reconvened at 2.05 p. m. after recess.

Q. (By Mr. CLARKE.) Have you any further statement to make before being interrogated by the commission?—A. I think not, Mr. Chairman. There may be something I may want to say after the questions are asked. I have so far

endeavored to outline the salient points of the subject; there may be some details that may come up in the course of your questions that I have purposely glided over so as to get the main features in your minds first.

Q. (By Mr. KENNEDY.) What is the comparative cost of putting down and maintaining a cable line?—A. What cable? We have cables between New York and Nova Scotia, connecting with our Atlantic cables.

Q. Do you have one between Key West and the mainland?—A. Yes; and one between Key West and Habana.

Q. Can you give the comparative cost of these lines?—A. The general cost of the cable is about \$1,000 a mile.

Q. How does that compare with the cost of the land lines?—A. That has only 1 conductor, while on the land line you may have several wires.

Q. The cables are very much more costly?—A. Infinitely more costly; and the question of maintenance is also very much more costly, because if you have a cable broken in deep water you have to fit out an elaborate expedition, a large ship, and she is dependent on wind and weather. She may be out a few days or she may be out weeks. We have had vessels out 3 months without effecting a repair; and then 2 months more on the same work—that is, in Atlantic work.

Q. Suppose you were to send a telegram from Washington to Key West; can you state what the cable expense of the telegram would be?—A. No, I could not; we work straight through.

Q. Have you any figures that would show?—A. I have not. I do not quite understand your question, I think. You mean the proportion of the cable expense?

Q. Yes; the proportion that you pay on account of cable carriage or transmission.—A. I could not give you any figures on that point for the reason that the maintenance of land lines goes on all the time and can be met by a continuous comparatively small expense. If a cable is broken it is necessary to send out a ship. You must either have a ship in commission all the time or fit out a ship, as we frequently do. When a cable breaks on the reefs off Key West we have to fit out a ship in New York, man it, send it down and bring it back, and it costs several thousand dollars to make the repair, whereas a break in a land line would be repaired in half an hour.

Q. What are the cable rates from New York to Great Britain?—A. Twenty-five cents a word, and the same rate is made to France or Germany as well as to Great Britain.

Q. What does distance have to do with the rate. Would half the distance cut it down much?—A. You would have less cable and, of course, less money invested.

Q. You made a comparison between sending a message from New York to Boston and sending a message from London to Liverpool, or from London to Paris?—A. Yes; that was on the 21-word basis.

Q. I want to ask you if that was a fair comparison, taking into view the fact that part of the distance between London and Paris is by the channel cable?—A. I think so. The cable is a short one. It is only 209 miles the whole distance.

Q. That was one instance where it was part land and part by cable?—A. Yes.

Q. Could you not pick out a similar distance on the mainland; say from Paris to some point or between any two points in the countries you mention where there would not be such a great difference?—A. It would be practically the same thing. The tariff between Paris and Berlin—I do not know the exact distance—is 4 cents a word. I do not think there would be much difference on that.

Q. What is the rate from Washington to Key West, do you know?—A. No.

Mr. HOLMES. One dollar for 10 words.

Q. What is the distance from Key West to Washington?—A. About 1,300 miles.

Q. Can you state the tariff from here to Pensacola?—A. Sixty cents.

Q. So the difference in the rate to Pensacola and to Key West would be on account of the cable rate?—A. There is a long distance from Pensacola on land to the cable.

Q. I would have liked to have a European comparison made over all-land lines the same as made in this country over all-land lines.—A. I have not the figures as to distance, but by the map you will see there is not much cable between Great Britain and France.

Q. It is a cable line?—A. Oh, yes; of course. It did not occur to me. I have not the distances between points on the Continent. I could not give you that, but I think the comparisons I have made are about fair.

Q. You do not know what the French rate is for 10 words?—A. It is 10 cents, I think, for 12 words.

Q. (By Mr. KENNEDY.) In England it is a cent a word?—A. It is 6d. for 12 words. Then you must remember the words are limited to 10 letters in these European counts whereas there is no limit with us.

Q. Can you give us a statement of the cost of erecting these telephone lines with iron poles; what the difference is, if any, between the cost of erecting their through lines and the cost to the Western Union?—A. No; I have no information on that point at all. Iron poles are used in India and in South America, but I do not know anything about their use here.

Q. There was something said about a former contract that you had with the Bell Telephone Company. Can you state to the commission the general terms of that contract?—A. The Western Union Company agreed to go out of the telephone business. There was a long fight on the patent question and it was compromised by the telephone company paying so much of its royalties to the telegraph company for the term of the contract; and the telephone company took over the plant that the Western Union had built. That is all.

Q. Was there any contract in regard to the division of territory?—A. None at all.

Q. In regard to the joint use of the patents of both companies?—A. The Bell Telephone Company had the use of all the patents, because it had the Bell patents.

Q. That contract is not in force now?—A. It expired in 1896.

Q. Could you furnish a copy of this contract to the commission?—A. I do not think I could agree to furnish any contract without the consent of the other parties. I do not think it would be businesslike or fair; I should object on my own part if anybody else were asked to furnish a contract to which I was a party.

Q. (By Mr. LITCHMAN.) We expect to have some one here before us representing the Bell Telephone Company. If they are willing, you have no objection?—A. None at all.

Q. (By Mr. KENNEDY.) You are doubtless aware, Mr. Clark, that the International Typographical Union has had what it calls a telegraph committee in Washington for several years trying to have a bill brought up for the Government to take over the telegraph companies, and one of the arguments they made is that if the Government were to assume control of the telegraph the rates would be the same to everybody; that there would be no news monopolies; that there would be more newspapers started in the country; more work for printers and pressmen and for everybody connected with the printing trade. Have you given any thought to that subject?—A. This is the first I have known there was any news monopoly. There are 3 press associations.

Q. I am not saying there is; I am only giving the statement of this committee.—A. I am only answering it in my own way. There are 3 press associations. Every newspaper is free to get any quantity of service it wishes on the same basis. The rates are open to all associations alike, and there is no discrimination at all on the part of the telegraph company, nor do I know of any on the part of the newspapers.

Q. Would any new association that sprang into existence have the privilege of getting the same rates that all the other companies get?—A. Exactly the same; for the same service exactly the same rates.

Q. Is there any contract with any one of the associations by which in case of storm, if there is only 1 or 2 wires left working, that association shall have the wire?—A. No.

Q. (By Mr. LITCHMAN.) Would the rate to the association depend on the number of papers served?—A. No; not if they have the same wires. If they had 1 circuit, they would be put on the same basis as that given to any other press association. A circuit provides that there shall be a terminal place and not less than 4 drops to begin with. The rate is for the first 300 miles. A rate of one-sixteenth of a cent for each 100 miles is added and a rate of one-eighth of a cent for each connection made.

Q. So that a new association starting would have the same privileges that the Associated Press has at the present time?—A. Absolutely.

Q. (By Mr. KENNEDY.) You say there is no arrangement by which newspaper associations or newspapers have a priority in the use of the wires?—A. Not at all; not that I know of. If there has ever been, I do not know anything about it.

Q. Did you ever have a contract with any New York or Philadelphia papers by which, in case of storm and frost and but one wire running, they should have the use of that last wire ahead of everybody else?—A. I never heard of it, but if such a condition ever did exist it does not exist to-day, and has not existed since I have known anything about the service.

Q. You would not speak for other companies, of course?—A. No; I am only speaking for the Western Union Company, but I think the same course would be taken by every other company.

Q. You spoke about a deficit of \$40,000,000 a year in England?—A. Not a year; no.

Q. For a certain period?—A. Since 1869.

Q. Was that on account of the telegraph alone or did it include the usual postal deficit, if there is any?—A. The English post-office makes a large profit every year, and the telegraph department is its only deficiating department.

Q. That \$40,000,000 was for the telegraph alone?—A. For the telegraph alone. The postmaster-general of Great Britain in his report for 1899 winds up by saying: "The postal revenue for the year, including the value of services rendered to other departments, was £13,394,335, an increase of £345,018 on that of the previous year. The postal expenditure was £9,683,704, an increase of £493,698 on that of the previous year. The net profit was thus £3,710,631, or £134,199 less than last year. The telegraph revenue of the year was £3,460,492, showing an increase of £200,347; the telegraphic expenditure £3,748,930, an increase of £266,912 upon the previous year. The net deficit on telegraphs was thus £288,438, or £66,569 more than last year." That is the working expense. If allowance be made for interest on capital, £10,868,663 for the purchase of the telegraph, the deficit for the year is raised to £387,326.

Q. (By Mr. CLARKE.) Do you know of any reason why the British Government could not raise its rates a little and thus overcome that deficit?—A. I had never thought of it, but it is a very hard thing to raise rates when once they have been put down, and particularly by a government whose chief reason for making them low is to serve the interest of all the people, or rather to serve the interest of the comparatively limited number of people who use the telegraph, at the expense of all.

Q. (By Mr. LITCHMAN.) Is not the extension of lines and cost of production a charge against that deficit?—A. I have taken that out in my statement of capitalization.

Q. How much was that?—A. The whole thing?

Q. I am talking about that particular year.—A. I think I analyzed that. The receipts for 1900 were £3,460,492. The expense for general operating was £3,394,900. The surplus was £65,592; interest on stock for the original purchase (the net interest on the rest of it is given in, as I explained this morning, on the general budget), £293,888, making a deficit of £133,296. Now, if you add to that the expenditures for extensions and buildings, £354,030, you make the deficit £487,326. Figure it as you will, you can make the British post-office telegraph department nothing but a department that makes a deficit every year, which has been growing larger and larger. Figuring it in the way that you suggested just now, it only takes in the interest of £293,888, which was the interest on the original grant of something over £10,000,000. Now, the £2,126,000 that has been spent for extension since the original grant of £10,000,000 was exhausted has gone into the general budget, and the interest has passed under the national debt in the usual way, I suppose. No charge has been made in any way on the interest of that £2,126,000. To do that would swell the deficit still more.

Q. Now, if that increase had taken place in your company it would have been provided for by the issuance of stock?—A. We would have had to provide for it.

Q. It would be a perpetual burden on the public, would it not?—A. It would have been an interest charge on the company, of course.

Q. If this debt of Great Britain is at any time paid, it ceases to be a burden on the people after it is paid?—A. Which debt; the national debt?

Q. Yes.—A. Oh, you have to come back to the question or decision whether you are going to tax the whole people for the benefit of the limited number for a function of the Government in that way.

Q. Is it not true that a decrease in the use of the telegraph, in the number of messages, increases the cost?—A. Yes; but there is a vanishing point of profit; you have a point where you can operate the plant for profit, and there is a point where you operate it for neither profit nor loss, and beyond that point you operate it for nothing but loss.

Q. Is not that point of profit determined by the original cost of the plant?—A. Not always; there may be conditions that will cause it to vary.

Q. If the original cost of the plant is an inflated cost and that remains a permanent charge, does it not have a material effect on the calculations?—A. Provided the conditions remain the same; but if you are applying that consideration to the telegraph, it has not been so. As I showed you this morning, \$50,000,000 have been put in the property to maintain it as an efficient working property that otherwise would have to be provided for by additional capital.

Q. Is it not true that when the Western Union Telegraph Company absorbed the Atlantic and Pacific and the American Union there was a very large increase in its capital stock?—A. Yes.

Q. And is it not true that in 1869 the president of your company in his report

estimated the cost of the Western Union line at \$22,000,000?—A. I do not remember that. I have not those reports. I laid them out to bring with me and forgot them. But I would like to answer your question about the Atlantic and Pacific and the American Union by quoting the decision of the United States court of appeals. Judge Earl, in the case of *Williams v. The Western Union*, on the question of the consolidation with the American Union and the Atlantic and Pacific, made this decision after a long trial and a very exhaustive examination of the whole question (reading): "On the 19th day of January, 1881, the property, franchises, and privileges belonging to the Western Union Telegraph Company were worth more than the amount of its capital over and above its indebtedness, and the property, rights, and franchises of the Atlantic and Pacific Telegraph Company were fully and fairly worth the sum of \$8,400,000, and the property, rights, and franchises of the American Union Telegraph Company were worth \$15,000,000; and such, on that day, were the estimates of the values made by the directors of the respective companies. The actual value of the investments of the surplus earnings of the defendant, the Western Union Telegraph Company, as they existed January 19, 1881, was estimated by the directors of the company; and it was their judgment that the amount of the stock to be distributed among the stockholders of the Western Union Telegraph Company represented no more than the investments of the surplus earnings of the company since July 1, 1866; and such surplus earnings were worth the sum of over \$15,526,500."

Q. (By Mr. LITCHMAN.) It is a fact that in 1869 the president of your company in his report assumed or estimated the cost of the line roughly at \$22,000,000. The capital at that time was \$40,000,000?—A. I do not remember that report. That is going back rather far.

Q. That difference between cost and capital still remains, does it not, in the \$97,000,000 of your capitalization?—A. I think not; because I have shown you that the capitalization per mile of wire has steadily gone down, for the reason that the property has been reconstructed without adding additional capital to it, and that steadily the capitalization is coming down all the time.

Q. Of course the amount expended for reconstruction has been taken out of the earnings of the company?—A. Exactly, as the reconstruction of all telegraph property must be provided for; otherwise you would have an inflation that to these gentlemen who on their theories are talking about it would simply be appalling. Every time you put in a new pole or new wire you would have to have a new issue of stock if it were not so. The life of a telegraph property is limited. It is different from a railroad roadbed, or even railroad rolling stock. It is subject to the constant effects of the weather: the rotting of the poles in the earth; and in case of iron wires, disintegration of the wires. We are using copper wire nearly all the time and putting in a superior quality of material. Since hard-drawn copper has been made practicable, nearly all our reconstruction has been made of that. To-day the property is made up of within a fraction of 20 per cent of copper wire.

Q. The claim is made that if the telegraph were under Government management this cost would go in as a part of the construction and not as stock, to become a burden on the users.—A. Where would the money come from for the construction under those circumstances?

Q. Would it not be accumulated in a system of sinking funds that would eventually wipe out the first cost?—A. No; I do not think it would.

Q. Is not that the plan by which waterworks and electric lights are paid for by municipalities?—A. I dare say some are; but a sinking fund—that practically comes to the same thing. If you provide the money for the reconstruction without issuing securities against it, it does not make any difference whether you call it a reconstruction fund or a sinking fund and divide it in that way; you have got to earn it. You have either got to take it from the outside as a new investment provided by somebody, either by stockholders of the company or by the Government, if it is a Government ownership, or you have to provide it from the earnings of the property, and if you call it a sinking fund it comes to precisely the same thing.

Q. Would there not be this difference—that in the case of a sinking fund the original cost is gradually wiped out, whereas in the case of stock it is a permanent charge upon which dividends have to be credited?—A. You have got to make a beginning somewhere.

Q. (By Mr. FARQUHAR.) Have you a sinking fund at all in connection with your bonds?—A. No; there was on the bonds that matured a little while ago, on one class of the bonds, but they have been paid off.

Q. (By Mr. LITCHMAN.) Could you give us the average cost of constructing a mile of poles with one wire?—A. You can not make an average. This country

has a surface of great geological variety. You may be able to dig a hole in the prairie and set a pole very quickly; then I have known of miles and miles of lines where we had to blast out every hole with dynamite to set the pole—to get it in the ground.

Q. I asked the question to ascertain whether there was some way of finding out the cost, on an average, of erecting a mile of wire and then of adding additional wire, so as to get at the expenditure of the company for extensions in a series of years by dividing the total expenditure by the number of miles of wire in the same period, and to ascertain whether you could in that way get at an approximation of the cost of the plant.—A. I do not think it can be shown with any degree of reliability. You can use such figures to answer any theory you choose; but upon the practical question of how much it costs to reproduce a system equal to the Western Union, to answer the same purposes, surviving the same difficulties, and being as efficient as that service, you can not. It fails because the conditions are entirely different.

Q. Has there been any reduction in the telegraph rates in the last 15 years as shown by dividing the receipts by the total number of messages?—A. In the last 15 years? No; I do not think that there have been any material reductions. We are reducing our rates in localities as fast as we can.

Q. You referred to the extreme cost of terminal construction. Could you give us some idea of the proportion which the expense of these terminals bears to the expense of ordinary construction?—A. No; I could not, because of the great variety of lines constructed throughout the country and the conditions in the different cities. For instance, take New York. We have a building there that cost us in the neighborhood of \$5,000,000, to start with, without any equipment. These are things which the people do not seem to understand—which they do not seem to give us credit for in any way. All the wires in New York are underground. We have to have subways to put them in and pay \$800 a year for every duct that we use, and so on. Take Chicago. We have a building there that cost from \$2,000,000 to \$2,500,000, absolutely necessary for our business. So it is. The moment you approach the ganglia of the system, the centers from which the whole system comes in and goes out, the cost accumulates beyond any theory of calculation based on lines built in the open, the basis that has been talked about.

Q. Is your building in New York used exclusively by your company?—A. No; not exclusively. We rent, I think, one floor to the Associated Press; but you have to have the building because you have to have the area—the space. Where you have 800 people working you have to have enough space for them to work in.

Q. I only asked the question to see if the income from the rents of the building were sufficiently appreciable to be an offset.—A. It does not amount to anything.

Q. Your company keeps a construction account, does it not?—A. Yes.

Q. That shows the items?—A. Only the total is taken, whatever the estimate may be for the year.

Q. Could you not supply that account when you revise your testimony, so as to show the cost per mile of wire and the cost set aside for terminals?—A. No. As I explained to you, the cost of construction this year may be of an entirely different character from what it may be next year. We may this year make extensions where it is exceedingly easy to build; next year we may have to go through rocks, where we may encounter all sorts of difficulties. I want to give you all the information you want; but, candidly, I can make no generalization of value concerning the construction of a system like ours that has to meet all sorts of conditions and overcome all sorts of difficulties. The expenses are so varied and so changed by conditions that I do not think it would be fair to us and I do not think it would lead to a right judgment on the part of the commission. Understand, I do not desire to withhold anything, but to give you all that will help you to come to a fair opinion, as well as to treat us with fairness.

Q. Would not that difficulty be met by a calculation covering a series of years?—A. Then you must get the character of the lines.

Q. What is the life of a mile of wire?—A. That all depends. Put a wire through Pittsburg or a place like that, where there are large numbers of factories, with acid fumes in the atmosphere all the time, and it lasts hardly any time at all; while a wire in the dry climate on the prairies will last a long time. Those are the conditions that make it difficult and absolutely impossible to supply useful information. I say in the light of long experience and in the light of very careful judgment on the matter that any generalization on the cost of reproducing a system like the Western Union, serving a large country like the United States, is fallacious and not fair as a valuation of that system. It is only inexperience that would try to make a valuation on that basis.

Q. (By Mr. KENNEDY.) Has the long-distance telephone cut into the receipts of the Western Union Telegraph Company appreciably?—A. No, sir. Our receipts are steadily growing.

Q. I would like to ask you about the practice of giving complimentary books to different classes of people by which they are able to send messages free. What is the principle on which that is done; also whether it is a good thing for the telegraph company, and whether it is a good thing morally to do?—A. As to the principle of the practice, it is a matter of personal courtesy only. As to the morals of it, I do not know that it has any moral effect, and I do not know that it has any immoral effect. I do not see where the immorality would be likely to show itself. If your question leads up to the point made by one of your witnesses that the telegraph companies try to debauch the legislatures by giving them franks and things of that kind, I think the best answer would be the existence of the complex State tax laws I mentioned this morning. And I do not know that we have received any great favors from Congress. On the contrary, I have been down here several times this winter fighting measures that would have been decidedly disadvantageous to the company, and I have had to use arguments, not franks.

I wish to say further, as to the idea of corporations debauching legislatures, that so far as the Western Union Company is concerned that company, to my knowledge, has never spent 1 cent, either directly or indirectly, for State or national legislation. I make that statement with all the impressiveness it is possible for me to employ. I should like also to say that I make this statement because Professor Parsons—I might as well name him—concluded his testimony before this commission by saying that he understood from Mr. Wanamaker that when his desire to make a Government telegraph was not adopted there was "a feeling of \$1,000,000 in the air around him," and Professor Parsons drew the conclusion, or rather he left the inference to be drawn by us—by you and by those who heard him—that the Western Union Telegraph Company was prepared to spend \$1,000,000 to defeat that measure. I merely wish to brand that statement as absolutely without any foundation in fact or justification in any way.

Q. You say the giving of passes is a personal courtesy. Is there any thought that they will bring a return to the company in any way by favors done, or are they given in any sense for favors done?—A. What favors? I do not know of any favors. I have just shown you that we do not get favors.

Q. It is entirely a matter of personal courtesy?—A. Yes; and it does not amount to anything. The amount of messages that are sent free by the Western Union Company in that way on this personal courtesy would not amount to a very small fraction of 1 per cent of all the messages sent.

Q. Do you keep an account of the expense to the company of this kind of messages?—A. No. We have an account, of course, of all the messages sent under franks charged up under the railroad contracts, as I have mentioned this morning.

Q. If the frank system were abolished would it make any difference in the rates?—A. No.

Q. (By Mr. LITCHMAN.) The question was asked of the Postal Telegraph man, and so we will ask it of you: Would these favors be given if a quid pro quo was not expected in return?—A. Yes; I do not know what quid pro quo could be expected. I do not know what the recipients could give us.

Q. That is what we are trying to find out.—A. That is what I would like to find out.

Q. (By Mr. KENNEDY.) Why don't you cut them off?—A. Why don't people cut off courtesies in other lines of business? Why don't theaters cut off deadheads?

Q. Is it not a fact that most members of Congress and State legislators have these franks?—A. Not that I know of; some do; but when you say most of them, that means a great many.

Q. Are they given voluntarily or do they ask for them?—A. I do not know. I really do not know anything about that. [Laughter.]

Q. Are the employees of the Western Union Company organized in what is known as labor unions?—A. Not that I know of.

Q. Is the company opposed to labor organizations?—A. That is a very large question that I do not care to answer. There was an organization in 1883, which the company refused to recognize; and I think, perhaps, that is the best answer. The company is always ready to deal with the personal grievances of its employees if they have any and put them on a fair basis, and we have every reason to suppose the employees are perfectly contented as they are.

Q. Have you any figures showing the wages paid to operators in different parts of the country?—A. I can give you an idea. They vary according to the experience and the age and the ability of the operator. In the large centers operators

are paid all the way from \$100 per month down, and in small offices outside they are paid smaller salaries where they are beginning. There is a regular scale as there is in every business.

Q. Was there any reduction of wages during the years of depression from 1893 to 1897?—A. No.

Q. Has there been any increase since then?—A. Not on the regular scale. There are increases going on all the time. As vacancies occur and men advance their salaries are increased as they fall into more responsible work.

Q. Is there any increase of wages resulting from the general prosperity of the country during the last few years?—A. The regular scale of wages has stayed about the same.

Q. (By Mr. FARQUHAR.) Are the wages now any greater than they were in 1883?—A. I have not the scale of 1883. I could not answer that question. Since then the operators have been paid for overtime and Sunday work.

Q. In the time since 1883 have the hours of labor been shortened by the day?—A. No; I think the scale has been the same ever since that time. I do not remember any changes in it.

Q. Did you pay on the 10-hours' scale at that time?—A. I have not the figures in mind. Nine hours for the 6 days in the week, and Sunday pay extra. That is the regulation, and it is the same all over the system.

Q. In 1883 you paid the extra hour of time?—A. Yes.

Q. And that has continued ever since?—A. Yes.

Q. Where do you get your supply of operators from?—A. From the young people in the offices. They begin in the large offices as check boys and check girls; and in the small offices they are generally friends of the operators and get the opportunity of learning there, and then they gradually work up in the business. There is also a school in the Cooper Union in New York that supplies a certain number. To that school the company makes a contribution, but I forget just how much it is.

Q. Do you take any graduates from the commercial colleges and schools?—A. We do not discriminate at all. If there is a vacancy and there is an applicant, and he is tried and found competent, he is employed. As I have said, it is entirely a question of supply and demand, as it is in every other business.

Q. Is the supply more than the demand all the time?—A. I should think it is. I would not be prepared to make a general statement, but I should say in a general way it is.

Q. In the working of your lines are the operators on your lines and on railroads interchangeable?—A. Yes.

Q. (By Mr. LITCHMAN.) I would like to ask a question right in that connection. Are the wages paid to girls the same as those paid to men?—A. No; not quite as much. The girls do not do as heavy work. They can not work as heavy wires. We have about 2,500 women altogether in the service, but they are necessarily not doing as constant and heavy work on the heavy press wires and circuits that require more energy as the men are.

Q. You spoke of having 2,500 women on the system. What proportion is that of the entire number?—A. As I pointed out this morning, we have, constructively, 35,000 people, but a large number of these—perhaps a fair estimate would be half of them—are employed by the railroads under the contracts that I spoke of. But for the handling of the public telegraph business they are, constructively, the employees of the Western Union Telegraph Company, which, of course, pays for their services in another way; and they are subject to the rules of the company in the transaction of the public telegraph business.

Q. Could you give the actual average rate for telegrams in the United States?—A. Yes; our annual report shows that for the messages we handled it is about 30.8 cents, and the expense is about 25.1 cents, that is on the 63,000,000 messages handled by the company after making proper deductions for the expense of maintaining leased wires over which a great many messages are sent by the lessees of which we do not get any account.

Q. How do you make it 30.8 cents?—A. By apportioning to this number of messages the full share of the expense.

Q. One is the gross and the other is the net?—A. Yes.

Q. What is the actual average rate of telegrams in Great Britain?—A. That I do not know.

Q. Is this average rate obtained by dividing the total receipts by the total number of telegrams?—A. No; by dividing the total receipts from the messages handled by the company, not putting into the proceeds receipts from leased wires, and stripping the receipts of everything but the proceeds from messages, and stripping from the expenses everything except that which is fairly chargeable to the messages we handled.

Q. Is not the same rule adopted in estimating the cost of messages in Great Britain?—A. I do not know. I have never seen anything about the cost of messages there. I do not know of any official statement that has ever been made—any estimate of the cost of the handling of their messages.

Q. Does the report you have there state the receipts from inland messages?—A. I do not know. I will say this, you must not take the inland messages alone. We do not do it. You have also to take cable messages and international messages. If you base any calculations of that kind on merely the inland messages you get false figures. For instance, we include all messages that we send over the Atlantic cables; that is, our proportion of the tolls from the point of origin to the cable point, and so we think you must include cable messages sent in the same way and the proportion of the messages sent to the Continent. By any other method, merely based on the inland messages, you get a figure that is absolutely wrong.

Q. If you divided the receipts from inland messages by the number of inland messages—A. (Interrupting.) But can you do that?

Q. I understood you could.—A. I understood you were dividing the gross receipts on the inland messages.

Q. From the testimony the inland messages yielded £2,280,574, and the number of messages was 74,151,385. That would give an average per message of 15 cents, would it not?—A. I do not know where you get those figures. However you may get the total receipts and total cost of messages you can not get away from the fact that the operation of the postal telegraph lines in Great Britain means a burden of at least \$2,000,000 per year on the taxpayers. You may figure and figure and figure, but still that result stares you in the face.

Q. You made a calculation this morning on the basis of 21 words as the average message in the United States; is it not true that the average message in Great Britain is 15 words?—A. I do not know.

Q. If that be true is it a fair comparison to make a calculation on the basis of 21 words where the other is only 15?—A. Pardon me. I think I was making the calculation on the basis not of the number in Great Britain, but on the number of words that would probably be used for a communication between Great Britain and the Continent.

Q. (By Mr. LITCHMAN.) Well, right there; what proportion of telegrams sent by Great Britain go abroad?—A. I do not know. What I say is this: If you send a message from New York to Chicago, to John Smith, 572 Dearborn street, Chicago, you name but one street. The chances are that if you send a message to London you have to name several streets; for instance, you may have to address it to John Smith, 6 Mornington Crescent, Hampstead Road, Camdentown, London, N.W.

Q. That being the case, and where messages average 15 words, is it fair to compare with the United States where the average is 21 words?—A. That basis for Great Britain, I judge, is on business that goes to small places where a man is known, for instance. In that case you would have it John Smith, Hampstead, whatever it may be.

Q. It is based on seventy-four million and odd messages?—A. That is all right, but a large number of the people whose messages you leave out of account of the cost there are paying a guinea a year for registration of a single word address: that is, two words—one for the name and street and one for the place, to cover John Smith, 543 Main street, Manchester, whatever it may be, or Henry Smith & Co., 760 River street, Huddersfield, or something of that sort.

Q. Well, if the total receipts are £3,000,000 they can not amount to a great many.—A. When you are trying to get at the average number of words in a message on which a fair basis of comparison of rates must be made for the general public, you must take that into consideration.

Q. Your basis of 21 words to the message involves the cost of 25 cents for 21 words, does it not?—A. Yes.

Q. Those 21 words would have cost, according to the foreign tariff, 21 cents, would they not?—A. In England.

Q. If the average message, then, in England is 15 words, the average cost would only be 15 cents?—A. That may be.

Q. And the comparison would be between 15 cents and 25 cents, and not between 21 cents and 25? That is the point I wanted to bring out.—A. That might be. That is, on the same basis; but please bear in mind that you are only comparing a limited territory. You could not apply that at all in this country without driving any telegraphic corporation into bankruptcy.

Q. I understand all these averages. I am not pinning you down and do not wish to do so. There is only one question to ask in that connection: What effect on the rate is had by the fact that different countries own the lines in Europe? Does not

that increase the cost?—A. Yes. That is shown by the statistics I have given you of the international lines. The messages passing over international lines in Europe are very much higher in tariff, figure as you will, than they are over the same territory with the unified system in the United States.

Q. (By Mr. FARQUHAR.) Suppose the British tariff schedule of rates was brought up to a paying condition, how much would they be advanced to cover the deficit that was made last year and the year before, for instance? What would be the cost of a message if it was taken at a paying rate to the Government?—A. They would have to increase them nearly 3 cents.

Q. That would bring the rate almost to the same tariff scale we have in this country?—A. Yes.

Q. In consideration of the shorter lines, too, there is 2 or 3 times the length on general messages?—A. Yes; there there are closer communities and compactor population.

Q. You hold, apparently, according to your annual report, a very large amount of securities of companies which have been taken over, I presume, in time?—A. Some of them have been and some of them have not.

Q. Do you issue a stock share of the Western Union Company that covers these shares at par value brought over from these other companies?—A. No; all of those are outside.

Q. Entirely outside?—A. Yes; they are leased companies that are included in the stocks of the guarantee companies that are not in the Western Union. Some of them I accounted for in the amount of the capitalization. I want to say that the stocks of other companies bearing the guarantee of the Western Union Company and not owned by it have been accounted for, but no stock has been issued to cover them at all.

Q. No stock has been issued to any of these companies?—A. No, sir; the stocks of companies for which Western Union stock has been issued have been taken in, of course, and canceled.

Q. Have you any idea as to the number of stockholders you have in the company?—A. Yes; about 11,000, in round figures.

Q. Can you give an idea as to how many stockholders hold large blocks of your stock?—A. No; I have not looked that up for some time. There are some large holders.

Q. Would they amount to over a hundred?—A. I do not believe they would amount to nearly a hundred. I should think, speaking offhand, 50 would be an extravagant estimate.

Q. What is your average dividend?—A. Five per cent is our regular dividend per annum. That has been the annual dividend for a number of years.

Q. Does your surplus go to extensions and betterment of lines?—A. It goes to construction.

Q. As a business man, do you know of any business in this country, corporate or otherwise, that can be brought under a rule of its worth being the cost of reproduction?—A. No; no successful business. If it is not successful, it is sold as a bankrupt concern.

Q. You know nothing of railroads, telegraph, or anything else where the theory of reproduction as to worth of the stock would hold good?—A. No, sir.

Q. Do you know of any business men in New York or elsewhere that ever held that opinion?—A. The opinion I expressed?

Q. No; I mean the expression of cost of reproduction.—A. No; not only no business man, but the decision that I have quoted to you of the appellate court of New York, distinctly, after examining the question, declared precisely as I do.

Q. (By Mr. LITCHMAN.) Right in that connection, supposing a company of capitalists should start to build a competing company of the Western Union Telegraph, would their business be based upon the capitalization of the Western Union Telegraph or upon the cost of construction of the line duplicating it?—A. That is a question I should not like to argue.

Q. You have answered a hypothetical question. Why is that not equally pertinent? I will state why I asked that question. I saw it stated not long ago that Mr. Rockefeller was contemplating duplicating the line of the Western Union Company, and that Mr. Russell Sage said if that was done he would be willing to dispose of his stock in the Western Union Telegraph Company even if he could not get but 50 cents on the dollar for it.—A. That is a matter of business contingency which I do not feel called upon to answer. I am only giving evidence here on the conditions as they exist.

Q. Would you object to saying what commission is paid to the Bell Telephone Company for receiving and delivering messages?—A. Fifteen per cent; about on the same basis of every other collecting and delivering agency on all our lines.

Q. You were asked the question what would be the added cost in Great Britain

to messages under certain contingencies, and you answered 3 cents?—A. I said I supposed so, by taking the amount of deficit and dividing by the number of messages. That is the only way I can get at it.

Q. That would not be added to 21 cents if it cost only 15 cents per message?—A. You say that the average is 15 cents; I do not know how you get at those figures.

Q. Assuming it is 15 cents, it would make the cost 18 cents?—A. Yes.

Q. For the sake of comparison in making up some tables in the office here, could you furnish reports of your company back for a number of years?—A. No. The annual reports contain statistics that run back to 1866. There is a table that has been printed over and over again.

Q. It does not cover the cost of construction during those times, does it?—A. No; I can't give that.

Q. (By Mr. KENNEDY.) Is there any increased cost to the public by reason of using the telephone in conjunction with the telegraph company?—A. Sometimes there is. If it is an independent line that runs into some place, they sometimes charge a small tariff for sending the message in, and then of course we have to charge that, whatever it may be.

Q. Ordinarily, it is not?—A. Not for the ordinary collecting and distributing through the telephone companies; the message goes to and from their subscribers, and we are the subscriber under those circumstances.

Q. (By Mr. LITCHMAN.) What do you think would be the effect of a general reduction in rates throughout the United States on an increase in business of your company?—A. As our facilities are about equal to the demands of the business, and we keep them there all the time, and the result is shown by our annual report, I think there is only one answer to that question: That it would mean loss to the company, because the physical capacity of wires and transmitting business has a limit. You can put all the wires you like into the woods of Michigan and across the prairies and into the mountains, but there is only so much business, and that is all you can get; and there is so much money necessary to spend to get it, and the facilities to these remote places now are more than enough all the time to meet the wants.

Q. Would there be, in your judgment, a sufficient increase in the income by an increase in the number of messages to counterbalance the loss by a reduction in the rate if the rate was fixed at 20 cents instead of 25?—A. I should think it would be a very serious question. You mean in New England?

Q. Let the reduction of 5 cents apply all around on the rate charged.—A. I think it would be a very serious question, which would require very careful consideration. We have considered those questions, and we have not seen our way to make that rate. That rate has been tried, as I said this morning, by the Baltimore and Ohio and several companies, and the result has been bankruptcy, and they have had to come to us.

Q. In the postal service a decrease in the postage has been followed by a tremendous increase in the number of letters.—A. But you do not make a parallel of that, I hope. The postal department is simply using the capital expended by corporations; it is only a matter of putting on another car on a train, if you want it. But once a telegraph wire is filled, you have got to construct another one the whole distance wherever you need it. There is no parallel between any public service of the Government that I know of and a Government telegraph, because the Government uses the facilities of other people for all other departments of its service. If you have business for a telegraph line, you have got to build a line for it the whole distance. If your mail matter increase 1 ton or 5 tons, the railroad simply puts on another car and carries it. No capital is expended; the track is there, the engine is there. But in the telegraph business it is entirely different. I think that a parallel between the British post-office and the post-office of the United States is about as good as you can get. The post-office of the United States is run at a loss of about \$3,000,000 a year, is it not?

Mr. FARQUHAR. Four millions.

The WITNESS. A year. The United States post-office gets 4 cents, 6 cents, 8 cents, where the British post-office gets 2 cents; and 4 cents where it gets 1. Yet with all that, with their higher rate, without the investment of capital to provide facilities for the service, they make a very great loss, while the British post-office goes on and makes a large profit. Now, then, if you are going to extend the telegraph in the United States on the same principle that is claimed by the advocates of the Government ownership idea, as was done in Great Britain, to carry it to every hamlet, you can not employ the capital of any other person to do it; you have got to go to the Government, you have got to provide the means somehow to build the lines out to every nook and corner. Those lines must be taken care of if you get business or if you do not; and if with the facilities I have shown

you this morning, the number of places we reach, and the number of places over a thousand inhabitants in each State are all provided with communication, we can only make enough at our rates to-day to provide for a small profit, and the Government is going to take over the system and spread it out with the necessary attendant expenses and put down the rates as has been advocated before you, it seems to me the result would be a deficiency, compared with which the deficiency in Great Britain would be a flea bite.

Q. (By Mr. LITCHMAN.) In speaking of the deficit of the United States post-office, is it not fair also to take into consideration the vast distances which mail matter is carried?—A. That is just the point I am making. You have just the same difference with the telegraph, and therefore will have a deficiency if you try telegraphs on that plan; the great differences in the distances will create a relative deficiency, just exactly as the present deficiency is compared with the British post-office.

Q. Well, the question originally asked was whether a decrease of the rate per message would not be followed by a large increase in the number of messages sent?—A. Yes; I said perhaps it would, but at a loss.

Q. Was not that the fact in the case of reduction in English telegraph rates in 1885?—A. Oh, yes; but was it not a fact that the deficiency ran up and is now running up to two million and a half every year?

Q. It is said to be a fact that messages increased two and one-half times in number in Great Britain.—A. You are talking about the question of increasing the business at a reduction of rate. Now, I say this to summarize the whole thing: You are asking me, as I understand it, whether if the company should put down the rate there would not be a great increase in business, with the inference that we would also make a profit. I say that the experience in Great Britain that you cite of the increased number of messages after the rate had been put down simply proves that the same thing could only be done here at a very serious loss to the companies. That is my deliberate judgment, in the light of the experience of other companies who have tried it and have gone into bankruptcy, and because of our own experience. We are studying the question and have studied it for years. We have a bureau that does nothing else except to look after the question of adapting our rates to the business and social demands of the country, with a proper regard to the vested interests of which we are trustees. I can only say that the present rates are fair, and that any radical reduction of rates such as was made in Great Britain would be followed by disastrous consequences to the owners of the property. Such a policy would be of no possible benefit to the people, and if the Government had the telegraph it would simply shift the burden from the stockholders to the taxpayers.

Q. When the Baltimore and Ohio Telegraph Company ran an opposition company to the Western Union, did not the Western Union make competing rates?—A. Yes, and stopped its dividends, while the Baltimore and Ohio Company became bankrupt.

Q. (By Mr. FARQUHAR.) You say that the press associations stand on all fours so far as rates are concerned?—A. Yes.

Q. The International Typographical Union's committee have been asking to have governmental control of the telegraph, so that these telegraph facilities could be extended to all papers in the United States. Is not that the plea they have made?—A. I believe it is, but it is a matter that does not concern us in any way; we are only the carriers of the reports of the associations; we have nothing to do with procuring or furnishing them.

Q. So you would say if there was any monopoly or discrimination it lies in the associations themselves?—A. Precisely. No telegraph company has any voice in that question at all. It is merely the transmitting agent of the press associations to the addresses given. If it sends the matter, or leases its wires to associations for their own uses, any association can get exactly the same terms in either case.

Q. You said also there was no priority in business. Is there not a priority for all Government business?—A. Yes; that is a part of the agreements with the Government which will be printed as exhibits—that Government business shall have priority. And I should like to say just one thing while we are talking about Government business: That the Western Union Company's service to the Government is not confined to the business specified in those contracts. You may not know it, but all of the business, the telegraph business, of this Government with Cuba throughout the Spanish campaign and since has been transmitted and is to-day transmitted free over the cable of the International Ocean Telegraph Company, which is leased and operated by the Western Union Telegraph Company. In one year we did more business over that cable for the United States Government than we did for the Spanish Government for the preceding 30 years.

of the concession, and we are doing it to-day. We are not making any face about it, but, on the contrary, we are very glad to put the United States Government in the same position as the Spanish Government was in. I wanted to say that to show that we are not so black as some of our socialistic friends like to paint us.

Q. (By Mr. LITCHMAN.) Is not the Western Union pursuing this course to keep the Postal Telegraph Company out of Cuba?—A. No, sir; we are simply keeping our contract like honest men. We have a concession in Cuba that provided that business of the Spanish Government should go free between Cuba and the United States until 1906. When the United States Government came into control, we put it in the same place as the Spanish Government, and all we ask is that the United States shall respect that contract as the Spanish Government has done.

Q. It is a fact that you are fighting the Postal to keep that company from getting a foothold in Cuba?—A. Pardon me; we are fighting to try and keep them from breaking down our rights.

Q. They are trying to get in, and you are resisting the attempt?—A. They have been trying to get in, but Congress has not done anything yet.

Q. (By Mr. KENNEDY.) Has there been an attempt made to bring about a consolidation between the Western Union and the Postal Telegraph companies?—A. Not that I am aware of. I have seen a report to that effect in the papers.

Q. Is there any community of ownership between them?—A. No, sir; not a dollar.

Q. Have you spoken as to the arrangements by which the ruinous competition of former years is done away with, etc.?—A. The Postal Telegraph managers found that they could not do anything in the matter of low rates, so they followed the rates of the Western Union.

Q. Was not that by mutual agreement?—A. There was an agreement, yes. That agreement was practically abolished; they simply follow the rates that we make.

Q. You make the rates and they follow?—A. The rates are generally understood. Anybody can get our rates by going into an office and asking for them.

Q. Is it desirable to bring about a consolidation of the two companies?—A. That I am not prepared to answer.

Q. (By Mr. LITCHMAN.) You have an interchange of messages?—A. Yes; that is, they turn messages over to us if they take them for any place they do not reach, and we transmit them.

Q. You prorate on these messages?—A. No.

Q. The additional tariff of your zone is added to their tariff?—A. Yes; or they may take them for our through rate, and turn them over to us at their point of origin, turning over the whole rate to us.

Q. (By Mr. CLARKE.) If the telegraph were to be owned and operated by the Government, would there be any saving in the employment for it of certain employees of the Government now in other occupations, like postmasters and clerks?—A. I should hardly think so, because a prerequisite would be a knowledge of telegraphy; in small offices particularly the postmaster would have to combine his ability as postmaster with the ability of a telegraph operator.

Q. That is the case with railroad station agents now, is it not, to a large extent?—A. Yes; they would be on the same basis, but there are, I imagine, a large number of postmasters that do not know anything about telegraphs.

Q. Was not that true somewhat of the railroad station agents?—A. Yes.

Q. One man can learn as well as the other?—A. Yes.

Q. Is it not true, then, that a very large number of small offices could be managed by the same person who does some other branch of Government work?—A. Yes; I think that is true. It is true of several of our offices in small places which are in the post-offices now.

Q. It has been charged that private or company ownership keeps out of use some of the latest and best inventions for operating the telegraph. Is there anything in that charge?—A. If the person or persons who make that charge will kindly name the apparatus, I should be very glad to know it.

Q. What is the policy of the Western Union Telegraph Company in reference to new inventions?—A. To develop every invention that it can lay its hands on that will improve the service, as I think its history proves with the quadruplex and other systems.

Q. Is the printing telegraph in use by the Western Union?—A. I do not know what you mean by the printing telegraph.

Q. The telegraph which uses the alphabet instead of the telegraphic signs.—A. Oh, the old-fashioned printing is in use, but we have an automatic system in use by which a message is sent over a punched slip, the same as the Wheatstone, and

received in printed Roman letters at the other end on an ordinary blank, ready for delivery.

Q. Is there not some invention by which messages are sent in Roman letters and are received in Roman letters?—A. Not that I know of. There have been a great many theories about such things. I know of no practical system of that kind.

Q. Is it practicable to send signatures and outlines of pictures, etc., by telegraph?—Yes; for short distances. That is a very old invention. That is Gray's telautograph, which is a development of several systems of that kind. The first one, I think, was an invention by Casselli, in Italy, some 20 or 30 years ago or more. I have forgotten the date. Then it was taken up by Edison and others.

Q. If that can be done, why is it not equally feasible to transmit Roman letters?—A. It is done, but only for short distances. It requires 2 or 3 wires, and is too slow—too slow to compete with the ordinary transmission of messages.

Q. Do you know of any reason why the Government could not operate the telegraph just as successfully as a company, provided it practiced good business methods?—A. Do you mean merely to operate it physically?

Q. Own it, and operate it, and maintain it, and keep it up to public demands.—A. I suppose the Government could do it by employing the same class of ability that the companies employ for management and for operation; but I do not think that the general history of Government operation of any system like a telegraph without an organized and permanent civil service, would make it satisfactory to the public. As to the financial part of it, I can only repeat what I have already said—that if the Government should own and operate the whole system of telegraphs in the United States it could only do so at a large annual deficiency, because there would undoubtedly be political clamor for extension of lines to all sorts of localities without regard to any sort of financial considerations, of financial profit. The result would simply be similar to that of the British post-office and, as far as I know, the financial results of the systems of other countries, except that with the larger extent of territory, the greater variety of climatic conditions and commercial conditions in the United States, the result would be very much more expensive than it is in other countries of which we have any record.

Q. Do you think, as a practical telegraph manager and financier, that the principle upon which the European countries which own and operate telegraphs administer that branch of the Government, namely, not to make the companies profitable, but to afford the largest possible service to the public, is a correct principle?—A. No; in the presence of a system that serves the public as well as the present system does, and of the evidence that there is very little territory—that there is no territory, in fact—where there is a great demand for the telegraph that it has not gone or does not reach by means of the telephone connections for collection of messages and distribution of messages, as I pointed out this morning, I think that no good public end would be served by it.

Q. Suppose the Government applied good business principles to the operation of it so as to make it yield a fair revenue, sufficient not only to pay all its current expenses, but to keep up the plant in good condition and to extend it as fast as there was a reasonable demand for it and to yield a small profit in addition to all that, what objection could you then see to Government ownership and control?—A. If you are speaking to me now as merely a citizen, that is another question. I see, then, a political difficulty and objection, and I imagine that a permanent civil-service arrangement such as prevails in all European countries would be distasteful for the telegraph or any other department in this country. Without it, the periodical shifting of operators, or managers of the offices, with political changes, would seriously demoralize the substantial business of the country, the business that depends on quick and steady communication; and values of produce, values of securities, and values of all kinds might be very materially interfered with. Under the present system instantaneous communication is maintained unbrokenly between the centers of commerce, and has to be. On that point you must also bear in mind that all governments who take over the telegraph systems at once start in by disavowing any responsibility for delays, for errors, for damages of any kind resulting from defective service, while the private ownerships are held responsible by the courts for the conduct of their business, and mulcted in damages for neglect or failure that very often they ought not to be responsible for. By that means very strict discipline is necessarily enforced, automatically almost. Under the Government ownership any complaint or claim is met simply by the statement that His Majesty's Government is not responsible for any mistake made on the telegraph line.

Q. In your opinion, could the mail service of the Government be carried on by private companies better than the Government does it?—A. I should not like to express an opinion on that subject; I do not know enough about it.

Q. If there were no deficit in the Post-Office Department, but, on the contrary, a profit, would not the Government administration of that public facility be a good strong argument in favor of operating the telegraph also?—A. I think not, because, as I said in one of my answers to Mr. Litchman, the conditions are entirely different. In the one case, the Post-Office employs the vehicle provided by the capital of corporations on railroads, and by a large number of individuals, as I understand it, for animal and like conveyances in the country districts. To meet the same conditions for the telegraph, it must necessarily provide a great deal of capital, much of which would necessarily be unproductive, and that would simply mean an additional burden on the taxpayer.

Q. Is there an active and strong demand in new regions of the country for telegraph facilities?—A. Yes, sir; where there are developments. I may mention an instance to you. The other day an oil well was found at Beaumont, Tex. Instantly there was a rush of people there, but by the time they got there we had some quadruplex instruments on the ground and had so increased the facilities that we were able to handle the business before they were down there. By the time business was well under way a wire was strung from Houston down, and complete provision made for that business.

Q. Would not a large number of places be accommodated with the telegraph if the Government owned it which now it does not seem an object to the company to bring into the field?—A. I think that it was the policy of extending the telegraph to unprofitable places in Great Britain that caused the deficiency. As I showed you this morning, the number of telegraph offices and connections with them so far exceeds the number of places with over 1,000 population in each State of the United States that the places not so reached must be very small and very remote, and any further extension could only be to such unprofitable places except as they are developed.

Q. That would be a public convenience not only to those places, but to people in other parts of the country who might wish to communicate with them, would it not?—A. Yes; it would come back to the question of who was to bear the expense.

Q. The same is true in regard to mail service in this country, is it not?—A. Yes; but there are much fewer places in this country with the post-offices. We have a larger percentage of telegraph offices to post-offices in this country than there are in Great Britain, as I showed you this morning.

Q. The fact remains, nevertheless, that there is a very large area not yet reached by telegraph?—A. Yes; where there is a shifting population, where there are ranches, and places of that kind, but I do not believe there are any places of any consequence where there is any demand for communication that we do not reach or that we are not in touch with.

Q. The Government sends mail, does it not, to thousands of offices, the business of which does not pay the cost?—A. I suppose so.

Q. Might it not do the same with telegraph messages and have the loss made up from business in more thickly settled portions of the country?—A. I should say no. If they can not do it in Great Britain, where the population is close together, where the country is thickly populated, and where, taking in Ireland and the highlands of Scotland and all those waste places, the population is still 333 to the mile, while our population is 76 to the mile, it seems to me that the result would be that the loss would grow in proportion to the size of the country.

Q. Well, could not the Government of Great Britain do it if it charged higher rates?—A. Suppose they were to charge higher rates; I do not see that that makes any argument here, where the distances are so much longer, and where conditions are so entirely different from what they are there.

Q. The long and short of it is this: Can there not be a rate that will be remunerative, not necessarily from every office, but taking the rates at large over the whole country?—A. I do not think you can make a juster or fairer division of rates than we have now.

Q. Suppose the Government accepted your scale of rates, then, entirely; could not they make it up?—A. Anybody, given the same conditions we have, could, I suppose, step into our shoes. But, as I understand it, the whole idea of Government ownership is that the Government has only to put its hand on the lines, reduce the rates so as to produce a tremendous increase in messages, provide an unlimited increase in facilities, and by some magic defy the ordinary law of the ledger and strike a balance somehow where expenses are more than receipts, without a deficit; and I do not see how it can do it.

Q. You think, then, that the chief danger of the Government making a failure of it if it undertook it, would be, first, that it would not do the business on business principles, and second, that it would be influenced by local considerations and political considerations?—A. I should think that these are obvious dangers, obvious possibilities.

Q. (By Mr. LITCHMAN.) Will you tell me the capacity of a cable?—A. Yes; with pleasure. It depends somewhat on the length of the cable. For an Atlantic cable, for instance, a cable that is laid in the Atlantic Ocean, that is from 1,800 to 2,500 miles long, the only guarantee any contractor will give you is 17 words a minute.

Q. It is substantially only one wire?—A. One wire right in the center, insulated and covered with iron or steel sheathing wires to protect it from friction outside.

Q. I wanted to bring out the fact of the relative capacity of a cable with a line of land wire.—A. You can put as many wires on a land line as the poles will carry. Submarine cables have only one conductor each. There is a cable [showing a drawing]. This is the insulation. This space is filled in with jute [indicating]. These wires are laid on the outside and the whole thing is about as big as your two fingers. A ship sails along and you commit your property to the mercy of the deep.

Q. (By Mr. CLARKE.) These side wires [indicating] are merely to give it strength?—A. That is all. Sometimes cables are laid in 2½ miles of water and you must have the necessary strength to stand the strain of lifting them from that depth for repairs.

Q. (By Mr. LITCHMAN.) How far, in comparison—referring to the question asked you by Colonel Clarke, between this country and Great Britain—would the difference in universal education in this country modify the view expressed by you?—A. I do not think it would influence it very much. I think that our people who want to telegraph, do telegraph. What I wanted to say this morning is that Great Britain is a good deal of a playground. London is peopled all the time with a swelling stream of strangers from all over the world. You take a traveler who goes over and lands at Queenstown. The first thing he does is to telegraph to London to see if his hotel accommodations are all right. There is a large amount of social telegraphing all the time, and the whole country is simply filled with large houses where house parties are going on all the time and there may be 20 people in the house telegraphing about servants —

Q. (By Mr. KENNEDY.) Can you "quad" the cable?—A. There is a fortune for you if you can do it. No; we can duplex it.

Q. (By Mr. FARQUHAR.) If the Western Union and Postal were taken over by this Government, it would be in the hands of Congress in the Post-Office committees?—A. Yes.

Q. The whole management of the appropriation, just as the appropriation is now for the postal service?—A. Yes.

Q. Do you see a danger in the usual way of Congressmen getting everything for their districts they can, in covering every Congressional district of the United States with the telegraph to every farm house or every crossroads in the country?—A. Well, I think that an opinion on that point can only be given in the light of experience.

Q. Do you not think that this giving a Congressman this opportunity to make extensions all over the United States in his district would in a larger measure bring in this selfishness that is contained in the river and harbor bill?—A. That is just what I do think.

Q. Do you not think that is really enough to wreck any proposition of Government ownership?—A. I think so, decidedly, and I think that that is the opinion of everyone who has really, carefully, conservatively, and intelligently thought over the question.

Q. (By Mr. KENNEDY.) I would like to ask if the post-office system is a political question? I would like to know if Government ownership of the telegraph would likely be any more a political question or a political machine than the Post-Office Department?—A. Well, is it not true that the postmasters are all changed with every new administration? And if you should undertake to change all the telegraph managers and operators with every administration, I think that the whole business of the country would be absolutely demoralized.

Mr. CLARKE. Can you think of anything further?

When your testimony is sent to you for revision, you can supply any data that you have neglected to supply here.

The WITNESS. There is one thing that I want to put in there. I said something about values on tax returns. That is all nonsense. The taxable valuations are on a real estate basis nearly all through the property, but that has no relation at all to the questions we have been considering.

Testimony closed.

Whereupon, at 4.10 p. m., the commission adjourned until to-morrow morning at 10.30 o'clock.

EXHIBIT A.

FOREIGN TELEGRAPH STATISTICS, 1898.

The figures on the right show the United States with the largest area (except greater Russia) and the fewest people per square mile, with only 0.33 mile of wire per square mile; have 76 people to every wire mile, and gives one person 0.0131 mile of wire to use. Great Britain, with a denser population and a network of wires (2.53 miles per square mile¹), has 130 people to every mile of wire, affording them but 0.0076 mile of wire each. In this way the United States is superior to all countries.

Countries.	Population.	Miles of line.	Miles of wire.	Offices.	Em- ployees.	Messages.	Receipts.	Cost of main- tenance.	Area, square miles.	People per square mile.	Miles of wire to square mile territory.	Number of people to square mile of wire.	Miles of wire to 1 person.

EXHIBIT D.

RATES OF PAY FOR GOVERNMENT COMMUNICATIONS BY TELEGRAPH.

ORDER }
No. 742. }POST-OFFICE DEPARTMENT,
Washington, D. C., June 30, 1900.

Pursuant to the authority vested in the Postmaster-General by the act of Congress entitled "An act to aid in the construction of telegraph lines, and to secure to the Government the use of the same for postal, military, and other purposes," approved July 24, 1868, and by the Revised Statutes of the United States, Title LXV, I hereby fix the rates at which such communications as the said statutes prescribe (not including those passing over circuits established by the Chief of the Weather Bureau, Department of Agriculture) shall be sent during the fiscal year beginning July 1, 1900, and terminating June 30, 1901, by the several companies within the effect of said statutes, as follows:

For day messages containing not more than twenty (20) words, exclusive of place from and date, twenty (20) cents, not exceeding one thousand (1,000) miles, and one cent for each additional word. One quarter of this rate to be added for each five hundred (500) miles, or fraction thereof, but no rate on a message of twenty (20) words to be more than forty (40) cents, nor on an additional word more than two (2) cents. The rate between all points in any State, Territory, or the District of Columbia shall be twenty (20) cents for twenty (20) words, and one cent for each additional word.

In cases where the price of a message, determined as herein provided, shall include a fraction of a cent, such fraction, if less than one-half, is to be disregarded; if one-half or more, it is to be counted as one cent.

For night messages not exceeding twenty (20) words, exclusive of place from and date, fifteen (15) cents for any distance within two thousand (2,000) miles, and for greater distances twenty-five (25) cents; in each case one cent for each additional word.

Instead of computing the actual distances of transmission, the distance for payment shall in all cases be taken absolutely to be the number of miles between the capital of the State or Territory, or from the city of Washington, if from within the District of Columbia, from within which (whatever the place) the message is sent, and the capital of the State or Territory, or the city of Washington, if within the District of Columbia, within which (whatever the place) the message is received, as shown in the accompanying table, wherein such distances are given as computed upon the shortest practicable route between such capitals, and which is to be taken as part of this order.

But it is provided that if, on the 1st day of July, 1900, or at any time during the ensuing year, any such company shall charge the public for a message of ten words or less, exclusive of the date, address, and signature, a less rate than is herein fixed for twenty words, exclusive of place from and date, the rates here prescribed shall, as to such company, thenceforth during the year be reduced to the rates so charged to the public.

The statutes provide that telegrams between the several Departments of the Government and their officers and agents, in their transmission over the lines of any such company, shall have priority over all other business. All officers of the United States sending such telegrams should indorse thereon the words "official business," and should report to the Postmaster General any failure to transmit them in such priority, and any charge made in excess of the rates above prescribed.

Each company will be allowed to charge for messages received from another line at the same rate as if received from the Government direct, at the point of transfer for transmission over its own line.

CH. EMORY SMITH, *Postmaster-General*.

Schedule of rates for Government telegrams on and after July 1, 1900.

Number of words.	Rate for twenty words and multiples of twenty, and for words additional to twenty or any multiple thereof.

EXHIBIT E.

RATES FOR TELEGRAPH SERVICE FOR THE WEATHER BUREAU, OVER WESTERN UNION, INTERNATIONAL OCEAN, AND POSTAL TELEGRAPH-CABLE COMPANIES' LINES, FOR THE FISCAL YEAR ENDING JUNE 30, 1901.

FOR MISCELLANEOUS MESSAGES.

For messages containing not more than twenty words, exclusive of place from and date, twenty cents, and for each additional word one cent, for all distances not exceeding one thousand miles.

For distances over one thousand miles, one-fourth the price of messages for one thousand miles to be added for every five hundred miles or fractional part thereof: *Provided*, That no message shall be more than two times the price of a message for one thousand miles. (Fractional parts of a cent to be dropped in all amounts.)

The rates between all points within the same State, Territory, or the District of Columbia shall be the same as for one thousand miles, to wit, twenty and one.

The distances from all points in one State, Territory, or the District of Columbia to all points in another State, Territory, or the District of Columbia, shall be taken arbitrarily to be the distance between the capitals of such States, Territories, or District, respectively, by the shortest practicable route, as shown by the published distance tables of the Post-Office Department. But it is provided that if, on the first day of July, 1899, or at any time during the ensuing year, the public shall be charged for a message of ten words or less, exclusive of the date, address, and signature, a less rate than is herein fixed for twenty words, exclusive of place from and date, the rate here prescribed shall, thenceforth during the year, be reduced to the rate so charged to the public.

FOR CIRCUIT REPORTS.

For weather reports in code words, over circuits as now or hereafter arranged for the purpose, each station copying all the reports sent from the other stations on the circuit, two and one-half cents per word over each circuit not exceeding one thousand miles in length and having not more than four intermediate and two terminal stations; one-half cent per word additional for circuits over one thousand miles in length: *Provided*, That no circuit shall exceed fifteen hundred miles in length; one-eighth cent per word to be added for each additional drop-copy station; one-eighth cent per word to be deducted for each drop-copy station

that may be discontinued beyond the four intermediate stations. Copies of all circuit reports, in installments of not more than two sheets at a time, must be delivered to the Weather Bureau observers promptly after their receipt at the stations on the different circuits, where messenger service is maintained.

SPECIAL RATE FOR CERTAIN FORECAST, AND ALL COTTON REGION, SUGAR AND RICE, AND CORN AND WHEAT REGION MESSAGES.

For all forecast messages distributed from designated circuit centers other than Washington, D. C., Chicago, Ill., San Francisco, Cal., and Portland, Oreg., on each day that they are telegraphed, the rate for miscellaneous messages will be charged for the first message and ten cents for each additional message.

For all forecast messages distributed from the circuit center of Washington, D. C., Chicago, Ill., San Francisco, Cal., and Portland, Oreg., to points other than regular Weather Bureau stations, on each day that they are telegraphed, the rate for miscellaneous messages will be charged for the first message and ten cents for each additional message. For all forecast messages telegraphed from Washington, D. C., Chicago, Ill., San Francisco, Cal., and Portland, Oreg., to regular Weather Bureau stations the rates for miscellaneous messages will apply. The message destined to the farthest point from the designated circuit centers shall be considered as the first message in each case.

For all cotton region, sugar and rice, and corn and wheat region messages on each day that they are telegraphed, twenty cents for the first message received at each circuit center and ten cents for each additional message.

Forecast, cotton region, sugar and rice, and corn and wheat region messages to be counted the same as miscellaneous messages, and one cent allowed for each additional word over twenty.

For rent of cable between Fort Point and Lime Point, California, at fifty dollars per month.

It is agreed that the above-named telegraph companies shall require their operators and agents to give priority to all Weather Bureau business, in accordance with the provisions of the act of Congress approved July 24, 1866, which provides that telegrams between the several departments of the Government shall have priority over all other business.

Schedule of word rates.

[All words, except place from and date, to be counted. Messages of less than twenty words to be charged at the rate of twenty words.]

WASHINGTON, D. C., April 17, 1901.

TESTIMONY OF MR. A. L. RANDALL,

Chairman International Typographical Union committee on Government control and ownership of the telegraph.

The commission met at 10.55 a. m. At 2.38 p. m., Mr. Litchman presiding, Mr. A. L. Randall appeared as a witness and, being duly sworn, testified as follows:

Q. (By Mr. LITCHMAN.) For the sake of the record, you will kindly give your name, post-office address, and your occupation.—A. A. L. Randall, 1510 North Capitol street, Washington, D. C.; assistant foreman, Government Printing Office.

Q. You are a member of the International Typographical Union committee on Government ownership and control of telegraphs?—A. Yes; chairman of that committee and have been since 1893.

Q. In that connection have you obtained certain knowledge and information in relation to the matter that may be desirable for us to hear?—A. I have. I may not be as well informed as I was 4 or 5 years ago. Since the Spanish-American war we have dropped down a little bit because we could not get a hearing on that account.

Q. Have you any prepared statement that you care to present in your own way?—A. Yes, sir.

Mr. LITCHMAN. Mr. Randall may make his statement and any members of the commission can ask such questions as may occur to them as being pertinent in connection with the inquiry.

The WITNESS. In 1893 the International Typographical Union of North America, at its forty-first annual session, held in the city of Chicago, put itself on record in favor of governmental ownership and control of the telegraph of this country, by adopting resolutions offered by myself, and directing its officers to appoint a committee, whose duty it should be to work and watch to further the interests of the measure. I was a delegate to that convention from Columbia Union, 101, of this city. A distinguished member of this commission, Mr. John L. Kennedy, was a colleague of mine. I was appointed chairman of the committee, and we at once proceeded to organize the country on this measure. In a short time petitions and resolutions from every nook and corner of the country began to pour into Congress, and after petitions bearing something like 300,000 signatures, besides hundreds of resolutions had been offered and referred to the House Post-Office and Post-Roads Committee, we succeeded in having a date fixed for the hearings to begin. May 4, 1894, was the date for the first hearing. I had the honor to open the hearing with a statement why our organization desired the Government to own and operate the telegraph lines of this country, and was followed by Mr. Samuel Gompers, president of the American Federation of Labor, who spoke at length on the great good the people of this country would derive if only the Government owned and controlled telegraphic communication, and he closed with an earnest appeal to the House committee to open their eyes to the present condition of the subject-matter.

We had six different hearings in all before that committee, and among those who made arguments and statements before the House committee, besides the above-mentioned gentlemen, were: Congressman Maguire, of California; John Davis, of Kansas; Gardiner G. Hubbard, father-in-law of Alexander Graham Bell, of Bell telephone fame; Marion Butler, of North Carolina, who was at that time president of the National Farmers' Alliance and Industrial Union, and later a United States Senator; Samuel H. Bell, and William McCabe, of the International Typographical Union committee. Some of these gentlemen spoke several times.

Very few members of either body were found who declared themselves in direct opposition to the measure. With only a few exceptions, all conversed with admitted that it was not only the right, but the duty of the Government to furnish the speediest and most efficient postal service in operation in any nation on the globe; that the people were not only entitled to the best, at the lowest possible cost, but that the demand for a postal telegraph, repeated with increasing force and persistency from year to year, would soon have to be met by the utilization by the Government of electricity for the speedy transmission of the urgent correspondence of the people, and that they ought not to be compelled to wait upon the more slow and antiquated methods and process of so-called "fast mail trains."

At a hearing granted to us by the Senate Post-Office Committee in 1896, Mr. P. B. Delany, a famous electrical expert and inventor, was among those who made arguments in favor of this measure. Mr. Delany, who has personally investigated the workings of the governmental telegraph systems of nearly every country in Europe, and who is especially familiar with the postal telegraph in Great Britain, on the lines of which country one of his more important inventions has been for some time in successful operation, then made an elaborate argument, from the standpoint of an expert, in favor of the annexation by the United States of the telegraph to its postal service.

During the period of active operations at the Capitol my committee frequently received timely and valuable advice and assistance from a very distinguished member of your commission, ex-Congressman John M. Farquhar, who from 1860 to 1882 was president of the National Typographical Union. Mr. Farquhar is the oldest ex-president of our organization now living. Veteran unionist, as he is, he has lost none of his old-time interest in our organization and its affairs.

We have also been successful in having public mass meetings throughout the country for the purpose of agitating the question and bringing it to the attention of all classes of people, thus enabling the business community to form a more intelligent idea of the advantages of the proposition, and also give the measure wider publicity and place the people in possession of essential facts regarding the scheme, which have heretofore been but little understood.

An organic opposition to a monopoly of any sort may be stated as my general reason for advocating the governmental ownership and control of the telegraph. I have received hundreds of letters from business men in different sections of the country, claiming that the rates are extortionate; that they are levied so as to yield large dividends, not only for the stocks paid for in money, but on what is

called "watered stocks," which are understood to be quite considerable in amounts. There is no doubt that at least two-thirds of the entire stock now outstanding on the Western Union is clear and unmingled water. This company, with its millions of capital, and with its monopoly of the business of the telegraph, is independent of any legal control for the protection of the rights and interests of the people—a condition of things which no just government should tolerate.

The telegraph has become a very important agency for the communication of intelligence, and the telegraph system of this country has been concentrated in the hands of a comparatively few persons, and has become a monopoly with power to levy such exactions on telegraphic communications as those who control the system may choose to establish. Too frequent exercise of the subtle and dangerous power possessed by this monopoly in thwarting the public will has resulted in a demand by the people that the Government shall own and operate the lines in the interest of all. Such ownership and control would be only a return to original conditions. The first telegraph line in America (from Washington to Baltimore) was built with an appropriation from Congress, and was operated by the Post-Office Department for 3 years.

For a great many years there has been a demand for the utilization of the telegraph for cheaper and speedier messages. The demand has been for some method of governmental control, but the influence of the few who have made a monopoly of this useful service has been sufficient to defeat so reasonable and just a demand.

Almost every Postmaster-General since 1846 has been in favor of the Government owning the telegraph.

I will quote the two following paragraphs from Postmaster-General Wanamaker's report of 1892, which is a splendid presentation of the case:

"I am fully convinced that the Government will never properly do the postal work committed to it until it uses electricity in some form, and therefore I advocate the utilization of both the telegraph and telephone at the earliest practicable day. To receive letters and other mail and store them away for shipment in bulk, more or less slowly once a day, or even every hour, when a wire and telegraph instrument might connect the major part of the post-offices seems an antiquated anomaly. It is true that a large part of the mails must always go by rail. But there is another considerable part that seeks quicker transit that does not find convenient the 10,000 railroad telegraph offices, often distant from villages, and does not find the telegraph carried within the reach of working people.

"The mail and telegraph are the life current of business, and to a large extent of social life, and the private monopoly of either system must result in creating a preferred class, to which high rates may not be objectionable. The humbler citizen must do without. It was said long ago that the telegraph was a monopoly, and so is the postal system; but the difference is that one is operated for private gain and the other for public good. The Government follows a settler across the plains and into the mines and establishes a post-office, in order that his family may have letters and newspapers and be more content in a frontier home. The telegraph goes where it can find paying business only; and so it falls out that only a sixtieth part of the people of the United States, owing, not to the need, but to the inconvenience and charges, employ the telegraph. The post-office helps to settle, serve, and satisfy the country—literally to make the country—and of all its adjuncts, the most important, that which would afford the quickest mode of communication between families near and far, apparently can not be made available in any way. The fact is that in some respects the telegraph seems to get farther and farther away as the capital and the power of the corporation increase."

Let us briefly trace the growth of this gigantic monopoly.

In 1858 the capital stock of the Western Union was \$385,700. The stock dividends declared between 1858 and 1866, a period of only 8 years, amounted to \$17,810,146, and the stock issued for new lines was \$1,937,950, making the capital stock on July 1, 1866, \$20,133,800. In that very year new stock was created to the amount of \$20,450,500, this making the capital stock on July 1, 1867, \$40,584,300. The largest dividend declared by the company up to 1874 was 414 per cent. The investors got their money back four times in 1 year. The largest amount of stock ever divided at one time was \$10,000,000, and for a period of 7 years the dividends were about 100 per cent a year on its average capital. In 1874 the company bought up its own stock and the stock of other telegraph companies and accumulated a fund of \$15,000,000, which was held in the treasury of the company. The following are some of the dividends declared: In 1862, 27 per cent; 1863, 100 per cent; 1864, 100 per cent. In 1878, \$6,000,000; in 1881, one of \$15,000,000 and another of \$4,300,000. It realized \$100,000,000 in 25 years by its extortionate charges. An investment of \$1,000 in Western Union stock in 1858 would have received up to 1890 stock dividends of more than \$50,000 and cash dividends equal

to \$100,000, or 300 per cent of dividends in a year. In 1890 its capital stock was \$83,960,000; but, from the last report I have been able to see of the Western Union, it took a jump which raised it to about \$115,000,000.

Says Mr. Wanamaker again:

"I believe that a telegraph company could make a great deal of money on a uniform 25-cent 20-word message to all parts of the country. The increase of business on lower rates would be so large that the profits of the telegraph company, in my judgment, would not be diminished. It can not be questioned that the Government, by reason of what it would save in the use of existing postal machinery, could easily by this time have afforded much lower rates than the present telegraph charges if it had continued to operate the lines it began. The people think more about these things than they are commonly supposed to do, and they are restive under conditions which they feel that the Government should change."

Just think of it! Sixty-one per cent of the telegraph lines of the world are under government ownership. All the countries of Europe own their telegraph lines. The rates for service are as follows:

England, 12 cents for 12 words; Germany, 17 cents for 10 words, and a discount of 14 cents for every word less than 10; Italy, 18 cents for 15 words; Switzerland, 10 cents for 10 words; Belgium, 9 cents for 10 words. In France the rate is 10 cents for 10 words within the country, and 2 cents per word from the French-African possessions, a 10-word message from North Africa costing but 20 cents. Distance is not considered in making the rate. No more charge is made for 100 miles than 1 mile, the same principle being applied as that governing our postal system. Most of these countries derive their revenue from the service. This is effected by combining the telegraph with the post-office. In Italy in 1890 the gross earnings of the lines was \$3,010,974; the expenses, \$2,703,137; leaving a net profit of \$306,837.

Here is what a telegraph operator says in regard to the monopoly imposing upon the people. Seldom is it that we can get one of them to say anything:

"Careful investigation shows that the Western Union favors one class of business and willfully neglects to do justice to another. Certain business, mostly brokers' messages, has special rights over everything else. The operator who is sending death messages, messages that summon children to the bedside of dying parents, or transact legitimate business of merchants and manufacturers, is often obliged to lay them aside in order that the wires may be used for the business of a trust, a monopoly, or a ring of speculators.

"Many broker companies hire wires for use during a few hours in the middle of the day. The leasing practice has grown to such proportions with the Western Union as to make it impossible for the regular volume of legitimate business to be handled readily, with the few wires retained for that purpose. What is the consequence? From 9 a. m. to 3 p. m. there is a large accumulation of business in repeating offices. The brokers' wires are then free, and they are manned to handle the business which has been obliged to wait."

In his report for 1880 Postmaster-General Maynard says:

"During my visit to the British post-office I examined with much interest the system of telegraphy, for several years past connected with the postal service. This method of correspondence is thought to have made a great advance since it was changed from the management of private corporations, responsible to nobody, hardly to public opinion, and placed under the control of the Government. The business has increased many fold, the cost of sending messages has been largely reduced, and the service is performed in many localities it never would have reached under the pecuniary stimulus of private enterprise. At the same time it yields a margin of profit to the royal treasury."

Postmaster-General Gresham in his report for 1883 said:

"The same principle which justified and demanded the transference of the mail on many chief routes from the horse-drawn coach on common highways to steam-impelled vehicles on land and water is equally potent to warrant the calling of the electro-magnetic telegraph in aid of the post-office in discharge of its great functions of rapidly transmitting correspondence and intelligence."

This measure has been indorsed heretofore by every commercial body of men in the United States—by every board of trade and chamber of commerce. The people who furnish 34 per cent of all the telegraph business ought to count. The national board of trade, at almost all of its sessions for the last 12 years, has resolved, in the strongest kind of language, that the necessities of the people of the country demanded that the Government should take control of the telegraphic system or build another system.

Here is what Hon. Henry W. Blair, of New Hampshire, had to say in connection with governmental ownership and control of the telegraph before the Henderson committee in 1894:

"I do not suppose the time has ever been, since the Government has existed, when they have not assumed control, for the benefit of the people universally, of the means of intellectual communication—the communication of intelligence as between individuals. That is the very starting point of society, and is one of the lines of demarcation between men and the brute creation. In fact the brutes themselves, so far as they have any capacity whatever, except mere force and inertia, have some method of communication between themselves. Away back we began with the postman. Then time and distance were the two obstacles to be overcome. The postman went with regularity; he went with comparative cheapness; he became a public vehicle and he was available to everybody; he was the first force or starting point; he was an educative force; he was of use in business; he was of use in social life; he was a necessity; he was a governmental institution.

"Then we went further and appropriated the horse because he could annihilate distance more rapidly and was a better means, when combined with postman, of accomplishing the same end—a social business educator.

"Then steam force was discovered. We appropriated that through the Post-Office Department to overcome time and distance in intercommunication, and that, too, without reference to the pecuniary ability or capacity of the Government to meet expenditure. It was a public benefit. It was educational—to educate the people in the establishment of a general system of post-offices and post-roads. Now we come in these later days to miraculous interpositions, as it were, to facilitate intercourse between the people. When we discovered the telegraph and telephone we appropriated the lightning. And right here, at this point, it would seem as though God had interposed in our favor to place within our control a means of communication vastly more important than all others before that, for the lightning actually annihilates both distance and time. So that the business man residing in San Francisco can sit down, as it were, side by side with another business man in New York and be brought into contact, where they can converse for 5 minutes or half an hour, their business communication, and oftentimes personal communication, being flashed across the continent instantly. So with the telegraph—not so great a convenience, to be sure, as the telephone.

"To make it all brief, it seems to me that we are not justified in promoting any private institution or system of private institutions or organizations of forces to step in here between the people and these modern discoveries and thus practically double the burden which is to be imposed upon the masses of the people at large, in order that we may avail ourselves of the whole of those means.

"I doubt whether we should stop and insist upon knowing whether it will pay by actual book account. But these agencies will pay in a thousand ways, pay in the saving of expenditures that all men in the course of their lives must make sometimes. So I think this comparatively cheap means of intercommunication that annihilates time and distance should be adopted.

"Then there are the matters of detail. You can work those out. I believe you can put these ideas into a bill and provide, if you please, that in some reasonable way existing companies should, if they find the interference of the Government in this general way—not for present uses but for general public uses—ruinous to vested capital, either have their properties purchased by the Government or be left to hold such field of occupation as may be proper. And there will be one. There will always be a large special field, which they can occupy with profit, for the transmission of business messages between brokers and all that. Leave the field open to them in the future in some way, so they may still find a profitable business, or by total or partial compensation, if necessary, prevent anything like a sequestration of vested capital. Provide some way so as to do justice all around, some proper and natural way, as has been found in foreign countries, where they are more accustomed than our people to the use of these two great miracles of intercommunication, the telephone and the telegraph. It seems to me that we ought to do that.

"Speaking of how monopolies have grown, I know myself how the Associated Press, with their arrangements with the telegraph companies for the sending of press dispatches, are an obstacle in the way of the establishment of newspaper enterprises throughout the country. In our own State, New Hampshire, we found very great difficulty—in fact, we have found it impossible, in the State where I live, to establish and maintain an important newspaper which we designed to establish, and for which the capital could easily have been obtained

without any difficulty. This has been so for many years, at least for 10 or 15 years."

You may wonder why the printers of the country are taking such an active interest in the governmental ownership and control of the telegraph. I will endeavor to tell you. It is true that we, as printers, have a selfish motive in desiring governmental ownership. The moment a law providing for governmental ownership should pass Congress that moment would the twin monopoly be broken, and then, we believe, in almost every city in the country at least one new paper would start. You may ask why new papers can not start now. Because the avenues in which the news is gathered are closed excepting to those who are so fortunate as to be members of the Associated Press, which has, by arrangement with the Western Union Telegraph Company, a monopoly of the telegraphic news gathering and distribution of the whole country. This association is thus enabled to serve its members with this class of news at a rate which places it out of reach of competition because of the favored rates granted by the Western Union.

In connection with this I wish to say that there was a time right here in the city of Washington when a syndicate desired to start a paper. They tried to buy a franchise which was not in use, and was locked up in a safe, but the owner wanted \$20,000 for it. I think that was the amount. Just think of it—\$20,000 for the mere privilege of buying the news! Just about enough to pay for a good newspaper plant. I am here to tell you that the syndicate never started the aforesaid paper. Through this failure a large number of situations were lost to our members here in Washington.

Government ownership of the telegraph will make it possible for all who desire to enter the daily newspaper field to get their telegraphic news on even terms. There are several hundred places where, I believe, new papers would start, thereby creating a demand for thousands of printers, not to speak of the other thousands of persons in kindred callings who will thus be put in the way of permanent employment.

I will leave it to you to judge what a relief and godsend it would be to the members of my craft if the Government would reassume ownership and control of the telegraph lines of this country and destroy these twin monopolies. The press rates could then be reduced so low that every country weekly paper could and would afford to print the latest telegraphic dispatches on the day of publication, and a telegraph or telephone could be at every country post-office.

Senate Report 242, Forty-third Congress, first session, page 5, says:

"The operations of the postal-telegraph system would result in a speedy termination of this alliance—the telegraph and news association and groups of favored papers—and will be a very important step toward the freedom of the press."

The Western Union people tell us there is no discrimination; that they treat all alike. We know this is not true. Prof. Frank Parsons, in Senate Doc. 63, Fifty-sixth Congress, first session, page 136, says:

"We have seen in part 6 (Arena, June, 1896) how rates were raised on papers that criticised the Western Union's president or advocated a postal telegraph too vigorously; how papers were ordered not to criticise news reports under penalty of loss of news facilities, etc. It is interesting to note that even the largest and most influential papers do not always escape persecution. In his speech in the House March 1, 1884, the Hon. John A. Anderson, of Kansas, tells us that "the Chicago Inter Ocean had the lease of a private wire from Washington to Chicago, and published Washington news every day. A few weeks since Senator Hill spoke for the postal telegraph. The Inter Ocean published the speech verbatim. That evening word was sent to the Inter Ocean that the lease was terminated. The manager of the Inter Ocean said afterwards that their relations with the Western Union were still friendly, but he had to be, of course, in order to keep the general dispatches."

Mr. Thomas F. Clark, vice-president of the Western Union, when before this commission last month, said in answer, when Mr. Kennedy asked him if the Government were to assume control of the telegraph whether the rates would be the same to every one, that there would be no news monopolies; there would be more newspapers started, etc. This is the first he had ever heard that there was a news monopoly. He said every newspaper was free to get any quantity of services it wishes on the same basis, and that there was no discrimination at all on the part of the telegraph company, and he said he did not know of any on the part of the newspapers.

I want to impress upon the members of the Industrial Commission that while Mr. Clark makes the statement that his company makes no discrimination, there is discrimination, as you would soon find out if you undertook to start another press association and asked the same privilege on the same basis given to the

existing news-gathering association. The Western Union says, "We don't discriminate." The Associated Press says, "We limit the field." Mr. Quigg, a member of the Henderson committee in 1894, said in this connection: "No doubt about that. To my mind that is one of the greatest evils we have to contend with—the fact that newspapers combine to create press associations, and thereby shut out other newspapers."

In Senate Doc. 65, Fifty-sixth Congress, first session, pages 55-56, Professor Parsons says:

"The final responsibility, however, rests with the Western Union. It is Western Union favor that gives the press associations their power of life and death over so many dailies. It is the fact that the Western Union serves a paper in the association for a fraction of the price that must be paid for the same service by a paper not in the association. It is this fact that enables the press association to control the newspaper field. If the Western Union would stand for fair play and equal rates to all, and make it a part of the press agreement that all papers should receive the news at fair rates without discrimination, the Associated Press would lose its tyrannical power of exclusion. But the Western Union prefers to be a coconspirator in the building of a press monopoly, because in return for its aid it gains a mighty hold upon the press. * * * The understanding between the telegraph company and the press association secures the latter low rates and the power of excluding new papers from the field, and to the former a strong influence upon press dispatches, the support of the papers in such associations, and the exclusive right to transmit and sell the market quotations. Besides the force of direct agreement and the powerful motives of mutual support that naturally develop between two individuals or corporations working together year after year with an ever-present consciousness in each of the vital relations to its prosperity that is sustained by the other—besides all this, the men who run the Western Union control a number of papers directly, and can control others whenever it may be thought best. The Western Union not only has its power of causing serious loss to newspapers that oppose it—it has millions with which to buy the stock of an obnoxious paper, so capturing the fortress entire and spiking the guns or turning them against its enemies."

The Washburn committee reported that "the associations themselves, and consequently the newspapers, are completely in the power of the telegraph companies, which can at any moment raise the rates for news telegrams to a par with those charged for private messages, and thus prevent their transmission almost altogether."

President Orton testified that the company had a compact with the Associated Press by which the latter agreed to stand by the Western Union.

Here is a copy of the agreement:

CONTRACT OF TELEGRAPH COMPANY WITH THE PRESS.

[Extract.]

And said Associated Press agrees that during the continuance of this agreement they and their agents, and all parties furnished by them with news for publication, and the agents of such parties, shall employ the said telegraph company, exclusively, to transmit to and from all places reached by its lines all telegraphic messages relating to the news or newspaper business; and that they will not in any way encourage or support any opposition or competing telegraph company.

PRIVATE CIRCULAR. (NOT FOR PUBLICATION.)

[Extract.]

CINCINNATI COMMERCIAL OFFICE, April 15, 1867.

To the Members of the Western Associated Press:

Your attention is invited to the clause in our contract with the telegraph company which forbids us to encourage or support any opposition or competing telegraph company. That clause was to the telegraph company a valuable consideration for the favorable terms upon which they contracted with us.

M. HALSTEAD,

Executive Committee, Western Associated Press.

I understand that when that matter was brought out at the time previous to this (I do not remember what committee it was before) that Brother Marean, who is present now, made a statement. The point my committee makes is that there is some such contract in vogue at the present day, although we can not prove it.

After the above-mentioned extracts had become public the Western Union rises up in all its glory and says that contract was "abrogated 20 years ago." But it shows the spirit that did exist which actuated this great corporation, and I feel satisfied in my own mind that there is an understanding between them to-day, if not another contract.

Before the Blair committee D. H. Craig said: "The Western Union and the Press Association work together to ruin a paper that buys news from any competing telegraph line."

I would like to say right here that Mr. Craig was the originator of the Associated Press of the United States. He adopted the carrier pigeons for that purpose in Boston years and years ago, and at one time he was the head one, as Brother Marean undoubtedly recollects himself, although he is not quite as old a man as Mr. Craig was before he died.

The editor of the only morning journal in one of the largest interior cities in New York State began to take news from a rival company and refused to discontinue. The Western Union complained to the Associated Press, and its manager negotiated with the publisher of an evening paper to run a morning edition, pledging him free and exclusive telegraphic press reports for a year. The rebellious editor quickly yielded.

And even at this late date—last month—Vice-President Clark, of the Western Union, tells this commission that this is the first he had known that there was such a thing as a news monopoly. It is too bad about him. But then a great many of his statements are like those of President Green and other Western Union people that have appeared before different committees on this subject. He says there is no discrimination at all on the part of the telegraph company, nor does he know of any on the part of the newspapers. Just think of that statement for a moment.

How does Mr. Clark account for these two statements?

Said Mr. Hubbard to the Hill committee:

"The man who rules the Associated Press has an instrument for shaping the opinions of the millions which, by the constancy and rapidity of its action, defies competition. The events which take place in all business, political, and religious centers, together with the actions of public men and their imputed motives, are all presented simultaneously to the public, from ocean to ocean, through this instrumentality. The agents who collect the news respond to the central authority at New York, and are subject to removal at its pleasure. Here is a power greater than any ever wielded by the French Directory, because in an era when public opinion is omnipotent, it can give, withhold, or color the information which shapes that opinion. It may impart an irresistible power to the caprice of an individual, and the reputation of the ablest and purest public man may be fatally tainted in every town and village of the continent by a midnight dispatch. It is incompatible with public safety that such an exclusive power to speak to the whole public in the same moment, upon every subject, and thus to create public opinion, should be under the absolute control of a corporation."

Before the Bingham committee Mr. Thurber, representing the national board of trade, said this in the course of his remarks:

"One reason why, perhaps, we have not had a postal telegraph long ago has been the fact of the close relations existing between the Western Union Telegraph Company and the Associated Press, which latter corporation has daily educated public opinion in the opposite direction. Mr. Wiman (a Western Union director who had just spoken) is evidently a fair man, but unless Mr. Wiman sees to it that both sides of this question, as presented here to-day, are sent out with equal fairness over the wires, you may be sure that all the points he has made will go flashing out to all parts of this country, and that all those that have been made against him will find their resting place only in the published proceedings of the national board of trade."

I could go on and quote other gentlemen who have made statements on this subject, some of them even stronger than these, but I will not detain you longer at this time. If Vice-President Clark is right in his statement, these gentlemen evidently do not know what they are talking about. I presume, however, if Mr. Clark would only stop for a moment and put on his thinking outfit, he might have a vague recollection that there was just a little discrimination both on the part of the Western Union and the Associated Press.

Again, Vice-President Clark makes a very "fishy" answer to some questions propounded to him while before this commission in March. He was asked the question if it was true that his company keeps out of use some of the best inventions for operating the telegraph. His answer was: "If persons who make that charge will kindly name the apparatus, I would be very glad to know it."

He was also asked what was the policy of his company in reference to new inventions, and he replied: "To develop every invention that it can lay its hands on that will improve the service."

It seems so foolish that a gentleman of the caliber of Mr. Clark would make such a statement that will go out to the public. He must have a very poor opinion of the general public to think for one moment that they would believe the answers that he makes to the above questions. It is confidently maintained by those having personal and expert knowledge of the subject that the existing telegraph companies do not make use of any of the recent improvements in telegraphy, thereby giving the people the benefit of a cheaper and quicker service.

I was invited to witness an exhibition of a new system, and I am confident that, if put into general use by the Government, it would revolutionize the telegraph business of the country. This system is more simple and reliable than any form of the Morse system, and is not affected by wet or changeable weather. It is called Machine Telegraphy, and has ten patents upon it.

To enlarge the sphere of the telegraph and make it eventually a part of the postal system (as it is already in every other civilized country of the world), two conditions are necessary. One of these is that we must utilize to a greater extent than at present the natural capacity of a wire for carrying electrical impulses. Practically, and in ordinary circuits of 300 to 500 miles, the limit has been demonstrated to be about 400 impulses per second by the Morse system—equal to 1,000 by the Morse quadruplex—equal to about 25 to 100 words per minute.

By the Machine system the Morse system can be more than doubled, and it can be operated perfectly in the heaviest rain storms in circuits of 1,000 miles, with 15,000 practical electrical impulses per second, equal to 1,000 words per minute. In circuits of 500 miles, the Machine system yields 30,000 practical impulses per second, equal to 2,000 words per minute. These are, of course, rates of speed strictly mechanical, and utterly beyond the capability of the human hand.

It is evident, then, that progress lies in the direction of utilizing the capacity of wires, or, in other words, in making one wire, operated mechanically, do the work of 20 to 50 under manual labor. This means a large reduction in the cost of plant, maintenance, etc., aggregating at least 50 to 75 per cent as compared with the most advantageous telegraph system now in use.

The actual cost of telegraphing by this new system, all things fairly considered, is rather less than more than one-fifth of the whole necessary expenses of the best form of telegraphing by the Morse or any other form of hand telegraph.

With this system, telegraphing of 50 words by day and 100 words by night can be afforded, with reasonable support from the public, at one-half (or less) the present tariff of the existing telegraph companies for telegraphing 10-word messages.

The system admits of an endless number and variety of cipher forms, whereby messages or letters may be telegraphed in cipher without the possibility of translation without the cipher key.

Should any interruptions occur in the line while messages are coming over the wire, even at 2,000 words per minute, the operators in charge can, by means of a telephonic attachment to the wire at either or both ends, instantly detect the loss of a single letter or word without any inspection of the record.

The matter to be telegraphed by this system must first be perforated upon a machine. These machines have key boards like those of typewriters, and are operated with equal ease and speed.

This system is especially adapted to newspaper reporting for individual journals or associations of journals, from 30,000 to 60,000 words (depending upon the length of the reports) being easily telegraphed over one wire in an hour, in all weather, in any circuit of 1,000 miles, twice this speed being assured in circuits of 500 miles. In circuits of 3,000 miles about 500 words per minute can be sent, as against 60 words, which is about the limit of the present hand system now in use.

The United States is the only Government that persists in carrying its mails by a slow conveyance in preference to a fast one. No valid reason can be advanced why a letter should be delayed 27 hours between Washington and Chicago, when it can be telegraphed and delivered by a postman within an hour, at a cost of 25 cents per 100 words by day or 200 words by night.

The change from train to the telegraph as a means of carrying letters is quite imperative, and fully as warrantable, as was the substitution of the train for the stagecoach many years ago.

Can there be any doubt about the willingness of the public to pay 25 cents to gain 27 hours between Washington and Chicago? The same argument may be applied to the mails between all other large cities throughout the country. The mails between Europe and China could be telegraphed between New York and San

Francisco, effecting a saving of 6 days. Letters for towns adjacent to the large cities throughout the country could be telegraphed to the nearest point reached by the Machine system. Newspaper reports would all go by this system on account of the immense decrease in cost and the lightning speed of transmission. Correspondence generally would immediately undergo a complete change, and the public would at once begin to reap the advantages of letter telegraphy, which must surely come through Government ownership and control of the telegraph and the adoption of some of the recent improvements in Machine telegraphy.

The above system has been thoroughly tried and approved. It was not only operated successfully 4 weeks consecutively over a wire 1,027 miles long between New York and Chicago, but it was subjected to a series of eminently successful practical tests by experts. Every claim made for it can thus be verified by incontrovertible proofs. We hope in the near future to have a joint committee appointed from the Senate and the House to investigate all improvements in Machine telegraphy, and to report the result of said investigation as soon as practicable to the Senate and House of Representatives.

It is all bosh what Mr. Clark says in regard to recent inventions. The Western Union is not favorable to new inventions, and it is almost impossible for any man to have a new invention tried by the Western Union. A man goes to the Western Union and says: "I have a new invention; I want you to try it."

The Western Union says, "Will you give it to me?"

"No."

"Will you give me the control?"

"No."

"Then you can't try it."

Whether that invention is a valuable one or not nobody can tell.

There are plenty of improvements in recent years in telegraphy, as anyone can find out if he will read the Official Gazette of the Patent Office regularly, but the existing companies secure them by purchase (I don't mean that they secure all of them, for if it be one that they are not afraid of they will not bother with it) and at once lock them up in their safes and thereby deprive the public of the great benefits that they would reap if they were put into general use. If the existing telegraph companies would put in use some of the recent improvements they now possess, there would be such a howl from the public at large for cheaper tolls that the companies would be compelled to reduce the tariff more than one-half of the present rate, and thereby cut off their enormous dividends.

No; they do not intend to use them unless compelled to do so. They would rather have their large dividend and continue with their power to rob at their pleasure by unreasonable charges all those who are compelled to use the telegraph. Are not the people of this country as capable of conducting a Government-owned telegraph as those of all European countries? A vast majority of the public demands that a business which touches the press, the public and private life, and the commercial operations of the entire nation at almost every point should no longer remain in private hands.

The International Typographical Union, which I represent, is asking the Government to control the telegraph in order that its membership may be benefited. As I said before, we have a selfish motive. If these twin monopolies are destroyed, all the papers throughout the land will be able to get the press reports on even terms. If the Government reassumes the operation of the telegraph it will at once adopt some one of the recent inventions similar to machine telegraphy, and can offer the existing press associations low rates—not more than one-half what they are now—and still have a revenue to the Government, with the promise that they will allow any and all papers to have the service on equal terms. That is the main thing that my organization is striving for. And I know, and you know, if the Government adopts this course it will not do as the Western Union is doing. It will at once put into general use some of the recent inventions whereby it can furnish the service at greatly reduced rates over what they are to-day. There are more ways than one of killing a dog. The press associations will stick to the Western Union until they see something cheaper, and then they will be willing to drop it. They are afraid to say anything at the present time. The Western Union holds them under its thumb and has dictated to them for years, and still Mr. Clark, vice-president of the Western Union, comes before this commission and makes the statement that the Western Union never did discriminate, and that he never knew that the Associated Press was a monopoly and that it discriminated. God knows that it is its stock in trade to discriminate. If it did not, the organization which I am representing here to-day would not be making the fight it has made for several years.

I hope this commission will consider well all the arguments, pro and con, on this subject, and trust that it will see its way clear to recommend to Congress this coming session that a special committee of 5 Senators and 5 Representatives be appointed to investigate recent improvements in telegraphy, and to report the result of such investigation as soon as practicable thereafter. This much I do hope this commission will do. The Western Union would not refuse to hire that committee a line in order to try inventions, which they most assuredly would do with a private citizen.

With this I conclude my general statement.

I have a statement as regards this machine telegraphy, the cost of a line from Washington to New York; that is, the expense of a line carrying 280,000 words daily and nightly per month, exclusive of the cost of the line.

(Reading:) "The actual cost of labor and materials for telegraphing 280,000 words, daily or nightly, between New York and Washington would be, exclusive of the cost of line:

23 perforators, working 7 hours daily, at \$30 per month	\$13, 820
27 copyists, at \$50	18, 600
Telegraph paper, at 5 cents per 1,000 words	5, 096
4 telegraphers, at \$80	3, 840
2 helpers, at \$30	480
Rent of 4 offices	5, 300
Fuel, lights, etc	1, 000
Stationery and incidentals	1, 000
Total cost	46, 236
"Or 5 cents for 100 words—one-half mill per word."	

[The witness thereupon produced certain papers bearing upon the question in hand, which are printed as an exhibit at the close of his testimony.]

Q. (By Mr. LITCHMAN.) You have claimed in your statement, if I understand it correctly, that the telegraphic service in foreign countries is cheaper than the service given in the United States?—A. Yes.

Q. The evidence given to this commission, considering the extent of territory and the fact that only the bare message is paid for here and not the address and signature, is that the difference is in favor of the United States. Have you gone into a comparison on that basis?—A. They do charge over there and we do not here, but the limit of messages generally falls below 10 words, and they are based upon a cent a word. For instance, in England 1 cent a word, and the charge would bring it up to about 15 cents for 15 words. That would take in the address and the signature, while in this country, of course, they only charge for the bare message, which would be 10 words or less, not counting the signature. But taking it right through and through, it will even itself up year in and year out, month in and month out. It is a great deal cheaper than it is here. They do not consider distances over there, and we should not here. I believe that the same system should prevail here that prevails there, the same thing that pertains to our Post-office Department; that there ought to be a uniform rate for messages throughout this country. While lots of people that are advocating Government ownership or operation of the telegraph, some advocate a uniform rate between certain sections, and then from that another uniform rate, so that everybody could know what the rates would be. And I do believe that if the Government owned and controlled and operated the telegraph of this country and adopted some of the recent inventions—there may be something a great deal better than this Anderson's machine telegraph—they could reduce the rate so they could make it a uniform rate throughout this country.

Q. Have you ever given any attention to the zone system of telegraphy?—A. No; not recently. A few years ago, when we were more actively engaged at this matter than we are now, when we were more in touch with it, we did have the zone part down, but I could not explain that satisfactorily now.

Q. Your idea, if I catch it, then, is that the distance should not be considered in telegraphy any more than in the carrying of the mails. Is that it?—A. Yes; for this reason, that the telegraph company have their lines up from Maine to California. They hire their operators for so many hours a day, and those operators are supposed to get their pay, although it is meager, whether they work or play; and it does not cost the Western Union Company or any other company, nor the Government, if it took hold of it, one cent more to send a message from here to San Francisco, notwithstanding they say so, than it would to send one from here to Alexandria. The wires are up and are in working order, and they

make it pay. Nineteen-twentieths of the telegraph business of this country is done within a radius of a thousand miles of New York, and those rates will pay what they call the long haul. The short haul will pay for the long haul.

Q. You have made certain statements in direct opposition to certain statements made by witnesses on the other side. The witnesses on the other side, if I remember, presented certain tables or statements to substantiate their claims. Have you any evidence to substantiate the claims you make further than what is given here in your statement?—A. I have not anything here with me.

Q. It is probably well that something of that sort should be submitted.—A. You say that they have some statements?

Q. They disclaim any discrimination, and they positively state that all parties are served under equal circumstances with equal service.—A. And that there is no monopoly in the new service? That is our main point; that is our committee's main point.

Q. They claim that there is no preference given to any combination that would not be given to any other combination or individuals under the same circumstances, and that equal service is offered to everybody now under the same circumstances.—A. But it is known, as I say in my statement, that just as soon as you would start to organize a company, just so soon you would find out the stump you were running against. If I was worth \$2,000,000 and wanted to start a newspaper in Washington, I could not get the press news; I would have to get specials, and the expense would be so far greater than the others that it would be ruinous to me. I could not get the press association dispatches unless the papers here agreed to it, and the papers here are combined together and agree not to do it; whereas if the Government should own and control the telegraph and reduce the rates and say, "Here, we will give you these special rates if your organization will give the same reports to any and all papers on equal terms," they would all come to it; they would leave the Western Union, but they are afraid to leave it now.

Q. What is the effect of the Illinois decision of the Chicago Inter-Ocean v. The Associated Press? Was not that to the effect that the Associated Press should serve all papers alike?—A. They do not serve them all. If Mr. Harris and myself should start a paper here, we could not get the service of the press unless the other papers agreed to it.

Q. Was not that decision in Illinois directly in opposition to your statement?—A. Yes, but the Inter-Ocean case was a peculiar one, but it does not work out. As I said, if we should start our plant in any city in this country where the association has a foothold, we can not get the press dispatches unless we get the consent of the established papers.

Q. The Inter-Ocean forced the Associated Press to give it the dispatches, did it not?—A. It is said that it did. Of course, there are peculiar influences which come up in different sections of the country that make things come around sometimes to your way of thinking.

Q. (By Mr. KENNEDY.) I would like to know something more about this machine system and who controls it; who owns it at the present time, and if the Government could get possession of it?—A. That would be rather a hard matter for me to state who owns it. I have an idea that the Western Union owns it to-day.

Q. Did you say you saw this system in operation?—A. Yes.

Q. (By Mr. LITCHMAN.) I want to ask if there is no other press association except the Associated Press?—A. Oh, yes; I believe there are 3 of them.

Q. What are they?—A. Associated Press, Scripps-McRae, and Laffan Bureau.

Q. Then there are other combinations that are receiving the news?—A. Yes; but they do not come up to the Associated Press. The Associated Press is the father of them all. They are the whole shooting match of this country.

Q. That is the only question I wanted to bring up. Now, Major, as I have got to go, will you kindly take charge of the committee?

The WITNESS. In connection with what Mr. Kennedy asked me here, I will read a little document that I have and also a letter following it, without giving the names; I do not desire to give the names.

Mr. KENNEDY. You ought to give the names, if you give it at all.

The WITNESS. I can give you the answer—

Mr. FARQUHAR (interrupting). We do not care about the matter as to whom it is addressed, if you will only give the signature of the man who makes the statement.

The WITNESS. It is addressed to me. I do not hold back my name. (Reading:)

"NEW YORK, February 18, 1895.

A. L. RANDALL,

*Chairman of Committee of Government Ownership and Control of Telegraphs,
Washington, D. C.*

"SIR: In reply to your inquiry at our interview of to-day asking as to what my position would be regarding the disposal of machine telegraphy in view of the fact that you are about to introduce a resolution in Congress for the purpose of establishing a committee to examine thoroughly into the merits of this system, and to preclude the premature disposition of these patents, thus rendering abortive all efforts heretofore made or to be made by your association looking to Government control of telegraphs, I would say that my plain duty in the premises, as I fully explained to you, is an absolute disposition of all these patents to the highest bidder; but recognizing the fact that the union as represented by you has done much preliminary work, and in view of the possible passage of such a resolution by this Congress, I am willing to cooperate with you in any reasonable way consistent with the position I am obliged to take.

"As I understand the situation, if this resolution is adopted by either or both Houses, your union will urge that control of a wire be obtained by contract or otherwise between New York and Washington, and a series of very exhaustive tests of this system undertaken, with a view of obtaining eventually from this committee a report favoring the position of your association, viz, that this system should be owned by, or at least controlled by the Government of the United States. I say to you now that if you succeed in passing this resolution and obtain control of a wire, and will promptly proceed to the making of these tests (which must be exhaustive in every particular), I will lock up any disposition of these patents during the term of the coming Congress, but no longer, reserving the right, however, if circumstances permit to dispose of these patents to anyone who may bid for the same, with a reserving clause that whoever takes the title to the same is precluded from transferring them to any existing telegraph company; and that they shall execute an agreement to put this system in public use as rapidly as they consistently can. But no disposition of these patents during this period shall be entertained or consummated by me until ample notice has been given to your association of my intention.

"I confess frankly to having no special interest in the aim and object of your committee in this matter, but if this resolution is passed you can further the wishes and desires of your association in no better way than by entertaining the proposition I made to you of taking an option on these patents, either in the name of your association or by such parties as your association can control, to purchase them at a fixed sum and thereby have absolute control of the entire system in your own hands to use and dispose of in such manner as you may deem to be the best interests of those whom you represent.

"Very truly, etc.,

W. L. CRAIG, *Executor.*

"P. S.—This letter is merely an index to the present situation, as I understand it, previous to the introduction or passage of any resolution in Congress. In case the resolution is passed, I think it is but fair to state that a legal document should be executed by us upon terms that are mutually satisfactory, with an absolute condition that pending a report and a final disposition of the same in the Fifty-fourth Congress, no sale or disposition of the patents should be permitted."

Q. (By Mr. KENNEDY.) That was evidently written by the party who had control of that patent there as owner of it?—A. He was executor.

Q. Then there is no doubt that the name of the party is known?—A. No doubt that Brother Marean (Washington manager of the Western Union) knows it.

Q. Why not give it to the commission? Are you violating any confidence?—A. No' his name is W. L. Craig, son of the old gentleman.

A second letter is as follows [reading]:

"NEW YORK, February 27, 1895.

"A. L. RANDALL, Esq.,

515 First street NE., Washington, D. C.

DEAR SIR: I have not heard from you since your return from Washington, and can only trust that you reached there safely. There are parties here that approached me yesterday in the matter of this machine telegraph, but whom they represent and whether outsiders or some existing telegraph company I can not say. Upon my notifying them that I could entertain no proposition until after the 15th of March, they returned to-day and were quite persistent in their endeavors to

find out what, if any, programme I had in view. I hope that you may be successful in this matter, and I wish very much that you would wire me of the result, whether favorable or unfavorable, not later than the day Congress adjourns.

"Very truly,

W. L. CRAIG, *Executor.*"

I think I wrote the gentleman a letter about a month later than that, and he wrote me that he thought that a campaign of education was too — slow for him, and he was willing to sell to the highest bidder. Then I wrote to him about a month after that again on the same subject in a different way, but I was completely snubbed; I never had an answer. I have met the gentleman twice, and he is head man of the health department of New York City.

Q. You say you believe the Western Union probably owns this patent?—A. I believe honestly, but I can not prove it. Mr. Craig said to me: "Mr. Randall, I have no sympathy with anything my father had to do with this, and I will sell this to the man that will give me the most; and as quick as he can give it, he will get it."

Q. (By Mr. FARQUHAR.) Who was the inventor of this system?—A. Anderson was the inventor. Mr. Anderson is dead. His wife owns a third interest, and D. H. Craig furnished the money and got the controlling interest, and this is Mr. Craig's son who is executor and has charge of it.

Q. How complete are the patents on this telegraph?—A. The last of 10 patents was issued in 1895. To use the slang phrase, it is a "lulu bird." After I returned from New York I took occasion to hunt up Brother Marean at his house where he would have plenty of time. I took this matter to show it to him one night about 10 o'clock [producing paper]. There is the one. That is the perforation of a message that I dictated over an artificial circuit to the president of our international body. Of course, you can not read it. That is the perforated part, and that is the way that came on the other end in the Morse characters [producing book and showing diagram]. This is the instrument here. There is the transmitter. You perforate here with the machine like a typewriter and you use it the same way, and it unrolls from a roll and rolls up as it is perforated, just as this matter is here, and as soon as you get through with your message you put it up under this part here. What I saw was on an artificial circuit, but we have the evidence of the experts that saw this work from New York to Chicago in all kinds of weather, and saw it do a thousand words a minute. That is the receiver over there. I stood right there and watched that; it was about as far as from here to Mr. Kennedy from me to the transmitter. That was no longer than a couple of years ago.

Q. (By Mr. FARQUHAR.) Well, to sum up on this Anderson patent, then, does the International Typographical Union or your committee intend to take any further action before Congress about this Anderson patent?—A. Our idea was that if we could get Congress to pass a resolution and appoint a committee to investigate this system that we would go to the Western Union and hire a wire. I went to Brother Marean in 1895 and asked him the price of a wire from here to New York, and I found I could not get it unless I used his instrument; could not secure it with any other instrument. We were going to attempt to form a little press association to run to New York for the purpose of agitating and educating the people in machine telegraphy, and thought we could get enough news to drop off at Wilmington, Philadelphia, and Trenton to contribute to the extension of this system, and at the same time we would have it in effect so that everybody would come to see it and give it a little showing through the country. That was our object. But Mr. Marean said no; that if we did not use his instruments he would refuse to give us a wire.

Mr. MAREAN. I do not think that is correct, because I know our leased wires are used for those purposes.

The WITNESS. Oh, no; I am talking honestly about what you told me down in your telegraph office in 1895. Do you not recollect?

Mr. MAREAN. We lease wires for doing business in competition with the others.

The WITNESS. Did you not tell me I could not put any instruments but your own on that? You have forgotten that.

Mr. MAREAN. There was a company that Abner McKinley was connected with for a few months—

The WITNESS. I have seen that worked, too.

Q. (By Mr. FARQUHAR.) Under the present operation of the Western Union Telegraph, the rate now is speeded up to 60 words a minute?—A. That is their highest limit when they use the Wheatstone.

Q. Would you say, then, that there is no opportunity of more speed under the present plan?—A. No; there is not unless they adopt some other invention.

Q. Then your idea is that you see in these patents a speedier system and one just as accurate as the Wheatstone if applied. But you have no positive practical knowledge, have you, that this Anderson system can be adopted by the Western Union?—A. I have only experts' testimony. I have experts' testimony that gave it a trial for one month between New York and Chicago; that is all. I will submit that report; but I would like to state that in the press reports they do not use this tape here [indicating]. They take a page length, line under line. That was done on the same machine, and it can be done on the same straight line, and for press reports, all that the compositor would have to do would be to learn the Morse alphabet. Then he could set it up better than he could with the ordinary manuscript, and he could set it up without making an error. When the papers adopted the type-setting machines every compositor had to learn to operate them, and it would not be any more for him to learn this than to learn the keys on the board, and after the printers once learned it they would have it down. Mr. Marean, have you seen that?

Mr. MAREAN. That would not permit the telegraphic editing of the dispatches.

The WITNESS. He can edit that the same as any copy; he can cut out there, and he can take it and write it there either way—scratch out or add to. That would not interfere. That can be used in case of press reports, so that it would not be any expense to copy it to the Government or the Western Union if they would put that system in effect—if they had it.

Q. Do you know or have you found out whether under the present plan of the Western Union they can cheapen their tariff?—A. They could cheapen it. You mean with the systems that they are using?

Q. Yes; I mean exactly as it stands.—A. The ones that they are using and not the ones that they have looked up?

Q. Yes.—A. That is a matter of their own. I can not tell that and you can not.

Q. What are the present limits?—A. Oh, 60 words a minute is the extreme they can go with the modes they use at the present time. That is the extreme limit they can go. They fall down to 15 and 25 words, but with circumstances and weather favorable they can go to 60 words with the Wheatstone patent.

Q. Would you say with the present system their rates are reasonable, considering the expense of operating their present lines?—A. No; certainly I do not. The trouble is, they have got to keep up all this watered stock, to strike a dividend, and if they would eliminate the water, they would make more money. They are making money anyway with the water, but I am claiming if they would use some of the recent inventions, they could make considerable reduction both in commercial and press reports.

Q. What connection have these press associations with the Western Union; any at all, or are they just separate commercial bodies?—A. There is a deal there we do not know.

Q. You do not know?—A. We do not know; no. We have ideas, of course, but that is not what you want to get—our ideas.

Q. You spoke of the country press being able to get these dispatches, even weekly papers, the day of publication, the latest dispatches. Who would collect those dispatches?—A. The statement I made was that if the Government took this machine telegraph system or some other recent ones that were better—but even though they were to take that and make a proposition to the Associated Press to cut rates down to so much, naming a figure where it could be almost half a mill, providing that association should give all newspapers, dailies and weeklies, throughout the length and breadth of the United States the same news on equal terms, the Associated Press would accept the arrangement, and by affecting this change we would break up that twin monopoly, as it now exists, as I believe, between the Associated Press and the Western Union.

Q. In other words, you would still maintain and keep up the Associated Press service only at a cheaper rate on account of cheaper appliances?—A. It would not be a monopoly then; everybody could get it. If I was out in a country town between here and Alexandria and had a dry-goods box and an Army press I could get as many words as I desired and pay the same rate I would pay between New York and Washington.

Q. Is it not a fact that this is the same contention of that legislative committee, that they shall furnish them service at a cheap, reasonable rate so that general intelligence, market reports, and everything of that kind shall be furnished to the newspapers at a much cheaper rate than they get it now? Practically that is where you stand.—A. That is what my committee is in existence for.

Q. Do you know what it costs any new paper to get into the Associated Press in the city of Washington?—A. None can get in.

Q. Provided the association were willing to let you in, I mean.—A. No; I do not know.

Q. Do you know what the privilege was ever offered to you for?—A. We tried to get it when we started the Times. The Times was started here by our local organization. I was chairman of the mass meeting that brought that paper into existence, and appointed the first committee on ways and means. We tried to get the telegraph news and we could not. At that time there was a fight, fortunately, between the Associated Press and the United Press. The Star had both concessions and for both morning and evening. They did not use the morning concession, and gave it to us and let us use the matter. We got the matter as long as we had the morning Times, but when we started the evening Times they shut us out.

Q. At what rate did you get in?—A. They paid \$25 a night as long as they used the matter.

Q. (By Mr. FARQUHAR.) You have no knowledge as to how much it takes to get into the association in other cities?—A. I do not know. I have heard at different times, but I do not recollect now, and I do not know whether what I heard was true at that time.

Q. Do you think that you can not get news service of any kind unless those that are in the local membership vote you in?—A. Oh, yes; that is understood; you have got to get in that way.

Q. It is exclusive?—A. Yes. If the Star and the Post say you can not come in here, you can not come in here; you can not come in here either morning or afternoon. You can get specials.

Q. The local papers have the right to name their own terms?—A. As far as I know they have the right to name the terms. I do not know whether they name the prices or not.

Q. Have you any knowledge that they name them, or ever have named them?—A. There is no doubt but what they do.

Q. Does the Associated Press in some capacity name the terms, whether in the local committee or in the general committee?—A. That I could not answer positively; I could not answer that positively. I think it is done both ways.

Q. You could not give a round sum at all, or any proposition that has been offered to get into this association and which has failed, could you?—A. No; the time we started the Times we did not make up any round sum. Printers as a general thing have not a surplus of money, and they did not have any big money to pay out on any such matter. We went there to try and get the telegraph news and we finally succeeded in getting the report until they made it an evening paper, and when they made it an evening paper then the Star shut us out.

Q. The case stands in this way, then. The Western Union Telegraph furnishes the lines for carrying the information; the Associated Press assembles or collects that information, and anyone going into the newspaper business has to be admitted into the Associated Press before he gets any of that news?—A. Yes; and it has been proved.

Q. And you say that the conditions and the rates in these local associations in cities are such that it would cost a man as much to get into the association as to start his newspaper?—A. Yes; but in nineteen-twentieths of the cases they would not give you a show even if you would raise the money.

Q. But if they would?—A. It would be too large for a man unless he had a large surplus to go in—and another thing with the Associated Press, it has been proven before committees of Congress, and evidence has been given to show that if one paper should get to advocating postal telegraph and Government ownership and control of the telegraph in different branches that the Western Union would take and put the screws down on the paper, and say, "Here, if you do not stop that we will take the news away from you." And the paper would stop. I have heard of lots of cases of that kind, but this I know to be a fact. A certain correspondent was sending matter to a paper of his, and it happened to be that he had been dropping in and giving his matter to the Postal Telegraph Company. It was only a few days until the Western Union came soliciting his matter, and wanted him to give them half of it. He told them no; that the Postal suited him better because it was handier, and he said, "I guess I will keep right on with the Postal." Well, it was only a few days, as I recollect, that this correspondent was notified from headquarters that "You must give the Western Union half of your work from this paper." They put the screws to him. It was not but a little while longer that he got a notice from headquarters again, saying, "You must give all your work to the Western Union." Put the screws to them again. And that is the way they have done to papers to crowd them out and push them down—papers that have been advocating Government telegraph in some form or other.

Q. Do you know whether the rates to other associations than the Associated Press are the same—that is, that they give equally as good rates, for instance, to the Scripps-McRae?—A. That I do not know.

Q. Or the Laffan Bureau?—A. I do not know; they keep their dealings to themselves.

Q. What is your authority for the statement of the laid-by messages—whether the laying by of domestic or family or general messages is done purposely to let through commercial or brokerage messages have precedence?—A. In answer to that question, take the business centers like New York and Chicago and places of that kind. Between 9 o'clock and 3 the work of the brokers and speculators generally is tremendous. The Western Union is in this business for money. We have got to bear that in mind. They are lending their wires to anybody for money, and they lease the wires between those hours. They own those wires, but the brokers and speculators do not have those wires as a general thing after 3 p. m. They use them between 9 and 3 p. m., and the other wires that are not leased to those brokers are overcrowded and the messages have got to lay by; and as soon as 3 p. m. arrives and the brokers' lease runs out for that day they man the wires and they unload those desks which were full of matter, ordering them to take their turn. Just like I saw in some statement before the House Post-Office and Post-Roads Committee several years ago, where some gentleman—it gave his name, but I do not remember it now—telegraphed from New York City to Terrence V. Powderly at Scranton that he would be there at 11 o'clock that evening, and he left New York about 20 minutes after he telegraphed. He got to Terrence V. Powderly's house and had been sitting there for 20 minutes at Scranton, Pa., before the message arrived. That was a case where the message was laid by. It was proven through this committee that there were several instances of that kind. The gentleman had arrived at Mr. Powderly's house 20 minutes before the Western Union message came notifying Mr. Powderly that he would arrive that night.

Q. Mr. Clark was questioned on that point very fully before this commission, and he gave the commission to understand that the facilities were so sufficient that the remedy would be simple.—A. It is almost impossible here in the city of Washington to get them out when Congress is in session.

If Mr. Clark made that statement, he knows very well that the Western Union can not handle the work at times with its slow way of handling—that is, in cities like New York, Chicago, and Boston. Lots of these people do make some very funny statements. Mr. Green, when he was president, several years ago when before a House committee, was asked a question as to how many telegraph companies he was president of. He stammered and said well, he did not know, but he thought it was 33 companies he was president of. This is a matter of record, too. He did not know how many companies he was president of.

Q. Is there any further statement you want to make, Mr. Randall?—A. Only that I would like to say it is a hard matter to find out the rates in this country. As I stated in my statement, we want a uniform rate, so everybody may know what the rates are to and from places. Of course, it is true that you can go into telegraph offices and ask how much it is to Oakland, Cal., and they will tell you, but you have got to go and ask them, and then you find that it will be a dollar. I therefore would like to have the following statement go along with this matter to show the difference, and as regards the difference in European countries:

Taking up the States alphabetically, the Western Union rates are:

Alabama, 10-word messages, 50 and 3.

Arizona, \$1 and 7.

Q. (By Mr. FARQUHAR.) Where is this from?—A. New York.

Q. (By Mr. KENNEDY.) What do you mean by \$1 and 7?—A. For 10 words, \$1, and 7 cents for each word in excess of 10. (Continuing:)

Arkansas, 50 and 3 and 60 and 4.

California, \$1 and 7.

Colorado, 75 and 5.

Connecticut, 25 and 2.

There is one good statement that Brother Clark did make, and he did tell the truth, that there were places in New England where they were sending telegrams for 25 cents.

Delaware, 25 and 2.

District of Columbia, 25 and 2.

Florida, 60 and 4.

Georgia, 50 and 3.

- Idaho, \$1 and 7.
 Illinois, 50 and 3.
 Chicago, 40 and 3.
 Indiana, 50 and 3 and 40 and 3.
 Indian Territory, 75 and 5.
 Iowa, 60 and 4, 50 and 3.
 Kansas, 60 and 4 and 50 and 3.
 Kentucky, 50 and 8 and 40 and 3.
 Louisiana, 60 and 4.
 Maine, 25 and 2.
 Manitoba, 75 and 5.
 Maryland, 25 and 2 and 30 and 2 and 40 and 3. There are three rates in Maryland.
 Massachusetts, 25 and 2.
 Minnesota, 60 and 4 and 50 and 3.
 Mississippi, 50 and 3.
 Missouri, 60 and 4 and 50 and 3.
 Montana, 75 and 5.
 Nebraska, 60 and 4 and 50 and 3.
 Nevada, \$1 and 7.
 New Brunswick, 50 and 3.
 New Hampshire, 20 and 1 and 25 and 2.
 New Mexico, 75 and 5.
 New York, 20 and 1 and 25 and 2.
 North Carolina, 50 and 3.
 North Dakota, 75 and 5.
 Ontario, 40 and 3.
 Oregon, \$1 and 7.
 Pennsylvania, 25 and 2 and 20 and 1.
 Quebec, 40 and 3.
 Rhode Island, 25 and 2.
 South Carolina, 50 and 3.
 South Dakota, 75 and 5.
 Tennessee, 50 and 3 and 40 and 3.
 Texas, 75 and 5 and 50 and 3.
 Utah, 75 and 5.
 Vermont, 25 and 2.
 Virginia, 40 and 3, 30 and 3, and 25 and 2.
 Washington, \$1 and 7.
 West Virginia, 40 and 3 and 35 and 2.
 Wisconsin, 50 and 3.
 Wyoming, 75 and 5.
- Q. (By Mr. FARQUHAR.) What figures are those?—A. They are the Western Union's figures.
- Q. The first figures cover the 10 words and the second figure is for each extra word?—A. Yes; that is right.
- Q. (By Mr. KENNEDY.) What is the date that schedule was in effect?—A. 1897.
- Q. Do you know whether the same schedule is in effect now?—A. Mr. Clark made the statement that in New England the rate is 25 cents. He claimed they had a bureau sitting continually systematizing and revising the tariff, but they do not revise it much. They are paying that commission an enormous salary to do nothing. And who pays it? The people who use the telegraph; and we would like to have the general public use it a little more than they do. Now, I have here special rates for newspapers, but I do not know whether there is any use in my offering them.
- Q. You know it is authentic?—A. Yes; I suppose it is. I got this from Mr. Marean himself, and I think he would not give me anything that was not right. The special rates are regulated by the commercial rates, day and night. Where the commercial rate is 20 and 1 and 25 and 1, the special rate is one-half of a cent in the day and one-fourth of a cent at night; where the commercial rate is 25 and 2, 30 and 2, or 35 and 2, the special rate is two-thirds of a cent in the day and one-third of a cent at night; where the rate is 40 and 3, 45 and 3, or 50 and 3, it is 1 cent in the day and one-half of a cent at night; where the rate is 60 and 4, it is 1½ cents in the day and two-thirds of a cent at night; where the rate is 75 and 5 the day rate is 1½ cents and the night rate five-sixths of a cent; where the commercial rate is \$1 and 7 the day rate is 2½ cents and the night rate 1½ cents. I think that is right.
- Q. (By Mr. FARQUHAR.) Is there any further statement you want to make?—A. After Mr. Roberts makes his statement I suppose I could add anything that

might come to my mind. There are quite a number of things I would like to make a statement of, but I can not just call them to mind. I would like to read this. It is from Senate Doc. No. 65, Fifty-sixth Congress, first session, page 60, speaking of franks. That was touched upon when Vice-President Clark was before your commission. (Reading:)

"Misgovernment and political corruption are evils to which the private telegraph contributes. Long ago the president of the Western Union said: 'The franks issued to Government officials constitute nearly a third of the complimentary business. The wires of the Western Union Company extend into 37 States and 9 Territories within the limits of the United States, and into 4 of the British provinces. In all of them our property is more or less subject to the action of the national, State, and municipal authorities, and the judicious use of complimentary franks among them has been the means of saving to the company many times the money value of the free service performed.'"

I would state in that connection that when Mr. Kennedy asked Mr. Clark the question here, Mr. Clark said that it was a mere matter of courtesy; nothing in it at all. At the same time I believe Mr. Kennedy asked why the company did not cut these franks off, and all the answer he got was "Why don't they cut the deadheads off at theaters?" I am here to state that just as soon as a man becomes a "statesman without a job" he doesn't have to be cut off. He doesn't have his franks after that. I know that when I was actively engaged in the agitation in 1894, 1895, 1896, parties came to me and showed me their franks; and some of them have since been left off for the reason that they took an active part in the agitation, and they have no franks now; if they asked for them they could not get them. But they did not used to have to ask for them when they were in office; they were sent to them. Yet Mr. Clark did not know anything about it; it was simply a courtesy.

During the strike of 1883 of the telegraphers in this country, the largest strike they ever did have, the newspapers asserted their independence. They came out and struck for Government ownership and operation. It oppressed them so that they could not get their news. I have a book here that is loaded down with extracts from newspapers all over this country, where the newspapers were contending that the Government could and ought to operate the telegraph, making a stronger argument than any we have made, or than is made in this document No. 65, notwithstanding it was prepared by Professor Parsons, who puts up about as strong an argument as any. But as soon as that strike was settled they had to go right back, or the screws would be put on them and they would lose the news.

There are one or two other things here on page 59 of this same document. Professor Parsons says this (reading):

"No person or corporation should have the power to mold the daily news or exclude any paper from printing it on equal terms with its rivals. The Western Union and the Associated Press are not the proper ones to decide whether or not a new paper shall be started or an old one depart this life. The success of a paper should depend upon its merit, not upon the favor of the Western Union or the assent of other papers.

"It is a good thing to gather the news to a central point and edit it to the country. An enormous amount of useless repetition is thereby avoided and a better distribution of news secured. But very careful provision should be made to secure the impartiality of such editing and distributing. If the association were open to all newspapers on equal terms, and the editor in chief were elected by all the newspapers, each casting 1 vote, and were sworn to impartial service, subject to removal by a vote of dissatisfaction on the part of 15 or 20 per cent of the constituent papers; if any paper or papers choosing to pay extra for a special representative could have one, entitled to a seat in the editing chamber, with full access to all materials received and authority to add a supplement to the chief's report to cover important matters omitted or misstated by the chief; if each and every paper were free to criticise the dispatches, then we should have laid the foundation for a free and impartial press. The very presence of the supplemental editors would probably, as a rule, prevent the necessity of supplemental reports by their potential effect upon the chief's report.

"The first step toward the establishment of an unfettered press is a national telegraph system, carrying the news or renting wires at very low rates on condition of impartial editing and distribution of dispatches on some such plan as that outlined above or a better one. The chains of the allied monopolies will thus be broken and the coordinate growth of intelligence and cooperation will gradually free the press in larger and larger degree from the limitations placed upon it by ignorance, prejudice, and the strife of competitive business and politics."

I guess I will close my remarks, inasmuch as it is getting late. We have quite a number of other things here, but I suppose I can revise this, and anything in that nature I can add.

Mr. FARQUHAR. Certainly; you can add what is pertinent.
(Testimony closed.)

EXHIBITS IN CONNECTION WITH MR. RANDALL'S TESTIMONY.

For a Postal Telegraph.

In Senate Doc. 65, Fifty-sixth Congress, first session, page 5, Professor Parsons says:

"The postal telegraph may be all right in Europe, but not in America. We don't want to imitate the monarchical systems and institutions of the Old World.' I wonder if the gentlemen who made this 'argument' and those who repeat it refrain from using the multiplication table and the ten commandments because they are in vogue in Norway and Sweden, Denmark, Belgium, etc. Do they abstain from wearing clothes because the wearing of clothes is an institution that exists in Russia? Do they go on their four legs for fear of imitating the kings and emperors by walking on two? We must not wear overcoats, or neckties, or trousers—the Germans do that. It was very dangerous, wasn't it, for us to adopt the idea of that monarchical Englishman, Stephenson, or the idea of that imperial Dutchman, Gutenberg, and it will be equally dangerous for us to adopt the idea of the despotic Gladstone that the telegraph is a good thing in a post-office, won't it? It does seem as though fast mails would be as valuable and sensible in a republic as in a monarchy. France thinks so, and Switzerland, the most democratic country in the world. New Zealand also, and the States of Australia. These are all republics, and each has a national telegraph system. We may imitate them if you insist on regarding the question as a matter of imitation; or we may take England as an example, for she is in every substantial sense as real a republic as the United States. In truth, such objections seem foolish and weak, and must arise from very careless thinking, reckless appeal to prejudice, or a desperate lack of good argument. I would not trouble the reader with a refutation were it not that men in high position have been known to repeat such absurdities and give them the impetus of their names, whereby insidious appeals are made to the thoughtless prejudice of unenlightened patriotism. True patriotism, wide awake, demands for America all that is good, whether it originates in Europe or the Fiji Islands. In the case of the telegraph, however, we have only to follow the lead of our own Government which was the first to adopt the electric telegraph and establish it in connection with the post-office, where it would have remained to this day had it not been for the power of private capital and the weakness of some of our legislators and the failure of others to foresee the enormous value of the telegraph.

"It will put the Government into the field of private enterprise.' Well, that is what the people have been doing since the dawn of civilization. Defense was once dependent entirely on private enterprise; so were education, justice, prevention and punishment of crime, guarding against disease, care of the sick, extinguishment of fire, manufacture of the weather, transmission of intelligence, etc. The people have put the Government into the field formerly occupied by private enterprise, because they have become aware that the Government could do the work better than private enterprise. In the present case of the telegraph, however, the quoted words at the head of this paragraph are not strictly true. It would have been more accurate to say of the postal telegraph, 'It will put the Government into the field of despotic monopoly.'"

The witness also submitted the following:

Again in Senate Doc. 65, Fifty-sixth Congress, first session, pages 9, 10, 11:

"Postmaster-General Bissell devotes three pages to the subject in his report for 1894. He opposes a postal telegraph. He thinks it would cause a deficit and be productive of 'wrangling and jealousy' through the 'limitless difficulty of determining the character, quality, and amount of service that should be accorded to the various sections of the country.' It is hard to see why the introduction of electric mails should cause any more wrangling and jealousy between different sections of the country or any more trouble in distributing the service than the introduction of steam mails or the adoption of the free-delivery system. Give fair facilities to all and better facilities where the amount of business warrants it. The test of population and business done determines the distribution of service now without the slightest difficulty and would do so just the same if the functions of the post-office were multiplied a hundredfold. As to the deficit, Mr. Bissell bases his belief on the assertion that the English postal telegraph does not pay

its operating expenses. This is not true, but if it were the conclusion of Mr. Bissell would not follow. If it is good logic to say 'England has a deficit on its postal telegraph, therefore the United States would have a deficit on its postal telegraph,' then it is good logic to say 'France, Switzerland, Sweden, Belgium, and other countries realize a profit on their postal telegraph, therefore the United States would make a profit on the postal telegraph.' As already remarked, the statement of the Postmaster-General in respect to England is not true, though he doubtless thought it was. He says, on page 48 of the report for 1894, that the interest on the English telegraph investment for the year 1893 was \$1,455,584. 'In the operation of the service there was a further loss of \$811,741.'

"The report of the English post-office for 1893 showed that there had been a large extension of lines to life-saving stations and other points, 673 new offices in all. I suspected that the cost of new construction had been included in the 'expenditures' assumed by Mr. Bissell to be operating expenses, so I wrote to the English postmaster-general, and here are the figures he sends me for 1893:

Total receipts	£2,536,312
New purchase and construction	185,609
Operating expenses	2,507,385
Total expenditure	2,692,994
Net profit on operation	18,927
Interest	298,888

"So there was a net profit on operation of \$91,635. I suppose someone who looks at the lump sums of the English postmaster-general's report for 1893-94 and does not think of inquiring about the items will be telling someone that there was a deficit in operation of almost a million, whereas the itemized account shows that, taking out the cost of new construction, there was a net profit of \$138,850. In 1890 the net profit was \$1,451,320, in 1887 it was \$442,420, in 1881 it was \$2,257,315, in 1875 it was \$435,375, in 1873 it was \$568,995; such are some of the figures taken at random. The profit varies, but every year from 1894 back to the first report in 1871, shows a considerable net profit in the operation of the telegraph. In the last 3 years and the 5 years from 1884 to 1888 the surplus was not sufficient to defray the cost of new construction or extensions; but in each of the other 16 years the net profit was a good deal more than sufficient for this purpose; the excess after paying for all extensions rising in some years as high as a million and a half of dollars. From February, 1870, down to the present time the actual cash received for postal-telegraph service in England has paid all operating expenses and all cost of extensions, new purchase, and construction, and turned into the treasury a net profit of \$6,683,610 besides rendering free services to other departments of the Government which at regular rates would have amounted to \$1,860,450. As we shall see hereafter, the English post-office has sent the telegraph into thousands of rural districts where the private companies did not and would not go, has established rates that are several flights of stairs below ours, and adopted the policy of raising the salaries of employees every year in a ratio of 2 to 3 per cent. In spite of all this the operating account shows the gratifying results above-mentioned—a financial as well as a social success. Yet the erroneous statement of Mr. Bissell will doubtless be quoted by persons opposing the postal telegraph without stopping to investigate its truth.

"As to capitalization and interest, we do not need to follow in the footsteps of the English post-office. We should not pay several times the value of existing lines if we buy, nor go into debt if we build. The whole matter can be managed without a dollar of taxation, as will appear hereafter, and our system can render good service at very low rates and still make a profit. Even if the English department had not made a profit in 1893, it would not follow that it must keep on at a loss, for its history shows that the surplus is small one year and large the next, moving up and down in an irregular line. Even if the English department made a loss every year it would not follow that we should do the same, for we need not carry the press dispatches at rates not only far below ours, but considerably below cost as England does. And, finally, even if a good postal-telegraph system in the United States should be operated at a loss (which need not be), still it would be no argument against its adoption until it were shown that its vast benefits were not worth the expense. And Postmaster-General Bissell should be the last one to raise such an objection, for on the first page of this very same report of his I find these words about the Post-Office Department: 'It can not and should not stop to consider little economies. It must needs exert itself to the utmost to secure the best possible results in the way of celerity, accuracy, and security in the dispatch of the mails, and without sparing any reasonable expenditures in that behalf.'"

Anderson's Machine Telegraph.

The witness submitted also the following:

DESCRIPTION OF ANDERSON'S MACHINE TELEGRAPH.

[From Senate Doc. 65, Fifty-sixth Congress.]

"The Anderson automatic has transmitted and recorded in perfectly legible characters 3,000 words per minute between New York and Washington, 351 miles, over a compound copper and steel wire of much smaller carrying capacity than the No. 4 copper wire, which would be used in constructing the new system according to the plans of the inventor. It has carried 800 words per minute over a similar compound 2-ohm wire 1,027 miles—from New York to Chicago; and it has carried from Jersey City to Philadelphia 1,500 words per minute, 90 miles, over a single small iron wire of a resistance of 25 ohms per mile, or more than 20 times the resistance of a No. 4 copper wire. Over an experimental line 8,000 words per minute have been recorded by this system. By the hand method the highest speed that an expert telegrapher can attain is about 45 words a minute, and ordinarily 15 to 25 words per minute is all that can be expected. With the quadruplex and four operators at each end of the line 60 to 80 words a minute may be sent over one wire, but the average is about 50 words per minute; so that the Anderson automatic makes one wire the equivalent of 40 to 100 of the ordinary Morse circuits in use by the Western Union, or 10 to 30 of its quadruplexed wires.

"Mr. W. E. Athearn, a very high authority, formerly chief electrician of the Baltimore and Ohio Telegraph Company, thoroughly tested the Anderson system, and says: "With a 1-ohm-per-mile resistance hard-drawn copper wire, strung upon well-set, substantial poles, the tests justify the belief that much more than 1,000 words per minute could be reliably telegraphed in all weathers."

In respect to cost of transmission with the Anderson automatic, Mr. Athearn says: "A careful approximate estimate of the cost of telegraphing, complete, 1,000 words from New York to Chicago, including perforating, transmitting, copying by typewriter at the receiving station, with liberal allowances for cost of labor, stationery, chemicals, etc., is about, but rather under, 50 cents. The present rates of the Western Union Telegraph Company for telegraphing a business message of 1,000 words from New York to Chicago are upward of \$30."

Mr. P. B. Delany, the great inventor of the multiplex, says: "At Philadelphia, on Monday, the 22d of February, 1892, I saw 1,500 words per minute received from Jersey City, in perfectly plain Morse characters, by the Anderson system of machine telegraphy. The line used was an iron wire with a resistance of about 25 ohms to the mile, or equivalent to double the length of an ordinary telegraph circuit. Judging from the character of the work, 2,000 words per minute might have been received if the transmitting machine at Jersey City had been geared up to that speed. There will be no difficulty whatever in working at a speed of 1,000 words a minute between New York and Chicago."

Mr. D. H. Bates, once of the Western Union management, and afterwards president and general manager of the Baltimore and Ohio Telegraph Company, examined the system in 1890 at the request of the Postmaster-General. He says: "The effect of the arrangement is to insure great speed, great accuracy, and legibility of the record at the receiving station, absence of all errors except those inherent in the line itself, and the presence of line faults may be instantly detected. Two large copper wires could accommodate, by means of the machine telegraph, all that 8 or 10 similar wires could handle by means of the quadruplex, the work being as well done and with a saving of one-third in the number of operators and clerks."

Mr. F. N. Gisborne, electrician and general superintendent of the government telegraph lines of the Dominion of Canada, told the Royal Society of Canada in May, 1891, that the Anderson system had accomplished, in a perfectly practical way, the astonishing feat of telegraphing 3,000 words a minute over a single wire 351 miles long, and 800 words a minute over a circuit of 1,027 miles in a heavy rain storm. Wherefore, 2 wires, operated by the Anderson system, were proved to have a capacity more than equal to 20 wires operated by the quadruplex system in general use by the American companies (the Western Union is supposed to have quadruplexed about 75,000 miles of its wire), which represent 80 ordinary Morse telegraph circuits, and require 160 skilled operators at the terminals and 20 workers to attend the repeaters at halfway stations between New York and Chicago. Mr. Gisborne also said it was clear that 100 words could be telegraphed

1,000 miles for 25 cents and yet allow a large profit to the telegraph companies. The decrease in the cost of line and its maintenance by the substitution of the Anderson system for present methods would be enormous, to say nothing of the far smaller number of operators and instruments required.

"The Montreal Gazette of June 13, 1891, commenting on Mr. Gisborne's address, said that he had shown how recent improvements in automatic telegraphy made it possible to compete successfully with the postal service for the carriage of letters, thus emphasizing the frequently expressed opinion that the time is ripe for the complete combination of the two services in the hands of the postal authorities.

"The method of operation is simple. The message is perforated on a strip of paper, which is put into the transmitter and passes under metal points. At each perforation these points pass through the paper and close the circuit for a length of time corresponding to the length of the perforation. At the receiving end the closing of the circuit makes a prussian-blue stain on a moving ribbon or sheet chemically prepared for the purpose.

"The perforating machine is as simple and efficient as an ordinary typewriter, and can be operated with the same ease and speed (1,800 to 2,000 words per hour).

"The page and line recorder prints the message on a letter sheet about ten words to the line, and is a great improvement over the paper ribbons for recording long messages, letters, or news reports. So says Mr. Athearn, and Mr. Bates says, "The page and line recorder marks a long step forward, and its use removes one of the chief obstacles heretofore barring the way to full success in autotelegraphic transmission."

"The business men's composing machine enables any person after a little practice to perforate a message for telegraphing as quickly as it could be written with a pen or typewriter (a perfect copy of the message for the office file being simultaneously printed in Roman characters). The use of this composer would considerably lessen the cost of telegraphing and would shorten the time required to get a message under way, the message being ready for the automatic transmitter the moment it is written and stamped, thus avoiding even an instant's delay. The reading of the message and counting of the words by the operator, taking the money, etc., uses up many instants with our system. Then the transmission is 50 to 100 times more rapid than that in general use to-day, and at the other end the attendant does not have to write out the message, but sends it at once as it is printed by the machine, if it is a quick delivery message, or talks it through the telephone directly to the addressee.

"Where the traffic is large the automatic effects a great saving in cost of construction as well as in cost of operation. A single line of hard-drawn copper wire No. 4 with the automatic is more than able to do the work of ten wires of the best quadruplex systems (300,000 words or 10,000 messages of 30 words in 8 hours), yet the cost of the single copper line is less than half the cost of a good 10-wire galvanized iron quadruplex outfit. The repairs and battery expenses of the automatic line are little if any more than a tenth of the corresponding maintenance expenses of the 10-wire quadruplex. The 10-wire quadruplex needs 80 first-class operators; and on a line like that from New York to Chicago, at least 5 repeaters would be required at Buffalo—85 operators; the equivalent automatic line would need 2 operators, 2 helpers, and 20 perforators (if the messages all came unprepared; so far as they were prepared in the offices of the senders the need for perforators at the telegraph office would cease); 4 to 22 workers against 85 workers with the quadruplex, to handle the same traffic in each case. With an 8-hour shift for the workers the cost of transmitting business under consideration would be about 6 cents per message of 30 words by quadruplex, and about 1 cent per message of 30 words by automatic, or one-half cent a message if the perforating were done by the sender.

"The number of letters passing daily between New York and Chicago is said to be about 40,000, and the telegrams 8,000. If letters were telegraphed at a low rate between these points, a vast number of missives from surrounding regions would cluster to them to save a day in transit, and the total might soon be nearer 100,000 than 40,000. Suppose, however, that in each 24 hours only 7,000 letters were to be telegraphed, averaging 100 words each, and 8,000 averaging 200 words each. A careful estimate based on considerable practical experience with the Anderson automatic shows that the cost of transmission of the 800,000,000 words of traffic per year would be about \$300,000, or less than 4 cents per 100 words, including labor, materials, repairs, and interest on the actual investment. Wherefore it appears that if a 5-cent telegraph stamp were added to a 100 word letter alongside of the ordinary 2-cent postage stamp, the 7 cents would more than pay for handling in the mails and for transmission by telegraph between

the two great centers nearest the origin and destination of the letter. As the 2-cent postage pays double the present cost of handling letters (Postmaster-General's Rept. 1893, p. 52), and the automatic transmission figures less than 4 cents, it is clear that 5 cents would cover the total actual cost, mail service and all, between New York and Chicago. It would not fully pay for transmission from New York to San Francisco; it would more than pay for such transmission between Boston and New York, Boston and Philadelphia, New York and Philadelphia, New York and Washington, New York and Chicago, Washington and Chicago, etc., making the average trunk-line transmission less than 5 cents for the entire country. If the messages were perforated by the sender and the automatic record sent to the addressee without copying into roman characters, the total cost of transmission per 100 words would be less than half of 5 cents. As the automatic was extended, and the postal telephone and multiplex netted the country more and more, messages would go to and from the automatic trunk terminals by these means instead of via the mail bag. The strategic point, however, is the automatic trunk line for telegraphing letters long distances instead of sending them by mail. That is the thing of all others that the post-office should aim to do at once.

"A business of 800 million words per annum could be transacted on two No. 4 wires running considerably below their capacity—estimating the capacity at the most moderate figure suggested by the experiments, viz, 800 to 1,000 words a minute. It may be interesting to state that it is estimated the transmission of the same traffic by the Western Union quadruplex would cost about 18 or 20 cents per 100 words—actual cost, I mean, including interest on the real investment. The special telegraph messenger service is not included in any of these estimates. The Western Union says that costs 2 cents a message. (Bingham Hearings, Green, p. 60.)

"A full account of the Anderson system with detailed data of cost of construction and operation will be found in a brochure entitled *Machine Telegraphy*, by W. L. Craig; M. B. Brown, printer, 49-57 Park place, New York, 1895. The data of pages 28 and 29 allow interest on the real investment, while those of page 27 are made up on the ordinary private corporation plan with large dividends on watered stock. Receiving copyists and rent are also included in pages 26 and 27, but not in the estimate of page 28. I have included copyists but not rent either in figuring the automatic or the Western Union cost. There would be substantially no addition for rent in a postal system, and even if allowed for at private rates it would amount to less than half a mill per 100 words automatic. The book figures on an 8-hour day for employees and allows \$50 to \$80 a month wages per employee. Its estimates of the cost of operating the quadruplex, and the cost of construction of the copper and the iron quadruplex lines, are all too high, according to other engineering authorities and the testimony before Congressional committees already cited. In the above statement I have given the corrected data in these respects. The letters and reports of Messrs. Athearn, Delany, D. H. Craig, and F. N. Gisborne may be found in the same book.

"Since writing the above I have received Senate Doc. 291, May 26, 1896, containing the testimony of P. B. Delany before the Butler Committee on Post-Offices and Post-Roads, Fifty-fourth Congress, first session, May 13 and 20, 1896. The great inventor, with charming modesty and open mindedness, says nothing about his own services to the science of telegraphy, but urges most powerfully the claims of the automatic, which is chiefly the work of others.

"He says in substance that with plenty of wires a single short message can be sent by hand about as quickly as by the machine system, but 'if the message is a long one, or if there are a thousand messages to transmit, it might take two days to get them off by hand, whereas if there are a sufficient number of perforators, the whole lot could be transmitted in a few minutes, the machine system affording the same capacity as 70 to 170 circuits worked by the present Morse system. * * * For the great bulk of telegraphic correspondence the hand method is inadequate, slow, and expensive. * * * The highest average of transmission over a single wire by the quadruplex was about 50 words a minute. Now it is practicable to telegraph 2,500 words a minute between Washington and New York and 1,000 words a minute between New York and Chicago, while the telephone carries speech 1,500 miles. * * * Last October (1895), over an actual line having but 130 pounds of copper to the mile (Philadelphia to Harrisburg and return), 216 miles, 940 words a minute were plainly recorded, the current used being 120 volts. The trial was made over the lines of the Pennsylvania Railroad Company, from the Broad street station, and was conducted in the presence of a board of well-known electrical experts. With this system 8,000 words a minute have been recorded over an experimental line, which shows the possibility of the latest development in machine telegraphy.'

"The inventor gave the committee an estimate on the construction and operation of an automatic line from New York to Chicago, as follows:

Construction per mile, 3-wire line.

35 poles, 30-foot, at \$4.	\$140.00
Setting poles, at \$1.50	52.50
Total for poles	192.50
Cross-arms, pins, and insulators, at 55 cents	19.25
2 copper wires, 850 pounds each per mile, at 15 cents per pound	255.00
1 iron wire, 600 pounds per mile	35.00
Stringing 3 wires, \$7 per mile	21.00
Incidentals	27.25
Per mile, 2 copper and 1 iron wire	550.00
1,000 miles	550,000.00
Complete equipment, apparatus, furnishing, etc.	50,000.00
Total	600,000.00

"The vast difference between this sort of construction and Western Union lines will be appreciated when you know that the Western Union uses little copper and that the iron wire it uses weighs about 130 pounds to the mile. The line described by Mr. Delany would be much more expensive than the lines considered in Part III, but not so much more costly, I believe, as the inventor's figures would indicate. Twelve men can set from 24 to 80 poles a day (Telegraph Construction, by J. C. Douglas, p. 362), according to soil and method and size of hole. Fifty cents each for setting should be a sufficient allowance for actual cost, and contractors are eager for the work at \$1 apiece. For the cost of poles themselves, the Western Union told the Census Bureau that its poles cost \$1 each. The Western Union has contracts with many railroads that relieve it of freight rates; but this was not the case with the construction described in Part III, note 13, where the figures show that the entire cost of poles could not have exceeded \$2 each, although they were hauled long distances. Two dollars per pole laid at the holes is what the telegraph builder figures in the Blair Hearings, volume 1, page 146, and he says his estimate is high. The estimate takes copper wire at 15 cents a pound, but it is quoted at that in ordinary purchases by retailers from wholesalers—28 cents retail selling price, 45 per cent off wholesale price to retail dealer in ordinary sized purchase of a few hundred pounds. Larger buyers get a 13-cent rate, and a purchase of 1,600,000 pounds ought to be made at 11 or 12 cents. A year ago even small purchases could be made at that rate. The iron is figured right, but the stringing is too high. Five dollars a mile of wire is ample. (See figures in Blair, I, p. 147, deducting the cost of setting poles.)

"Passing from the construction account with the impression that it is too high, we come to the cost of operation. Calculating at the minimum average of 800 words per minute, or 1,600 for the two wires, Mr. Delany's data place the cost per message of 70 words from New York to Chicago at 4½ cents, including interest on his construction account and every expense but postage, which ought not to be over 1 cent. If the sender does his own perforating, and the message is sent to the addressee in Morse characters, the cost of transmission would be a trifle over 1½ cents per message of 70 words, or 2½ cents a hundred, not including postage. This is not probably below the truth, for the tendency of the witness was to make his estimates of operation high as well as his estimates of construction—a tendency plainly manifest in his giving the perforators a speed of about 15 words a minute, which is far within their practical capacity.

"In the Electrical Engineer for September 4, 1895, there is an estimate of cost by Delany which runs a little lower than the one he gave the Butler committee in May, 1896, viz, 2.6 cents per message of 50 words from New York to Chicago, including interest and omitting postage. This agrees substantially with Mr. Athearn's data. The article last referred to says that between New York and Philadelphia a single wire with 300 pounds of copper to the mile will carry 3,000 words a minute, and the automatic will record them in dots and dashes as sharp as an engraving. To do this by hand would take 38 wires worked quadruplex, or 152 circuits at nearly 20 words a minute, which every telegrapher will admit is too high an average for quadruplex circuits. Over an iron wire 350 pounds to the mile, which gives 60 words a minute quadruplexed, the automatic will carry 2,000 words a minute between New York and Philadelphia."

WASHINGTON, D. C., April 17, 1901.

TESTIMONY OF MR. F. C. ROBERTS,*Member International Typographical Union Telegraph Committee.*

The commission being in session, at 4.20 p. m. Mr. F. C. Roberts was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Give your name and address and occupation to the stenographer.—A. F. C. Roberts, 509 New Jersey avenue, Washington; occupation, compositor.

Q. How long have you been a member of the legislative committee of the International Typographical Union?—A. I think about 5 years.

Q. Have you any remarks in printed or written form that you would like to present to the commission before any questions are asked?—A. I have a statement prepared I would like to submit.

Q. The commission would like to hear it now.

Mr. Roberts read as follows: I do not think it necessary to argue before or to urge upon the commission the right of the Government to own or to operate a system of telegraphy in our own country. It seems to me that our own Post-Office Department is the best argument and the best evidence that the Government has the right to construct, to own, and to operate that means of communication. Surely if the Government has the right to transmit your letters it can not be denied the right to handle your telegrams.

In 1866 the Western Union Telegraph Company practically conceded the right of the Government to either construct a new system or to purchase its system of telegraphic communication in the United States, and merely asked that Congress should permit that company to operate for at least the term of 5 years, in order that the large capital invested in its plant might not be ruthlessly destroyed without an adequate return to those who had placed their earnings and savings therein. So much has been said and written on this subject by many of the ablest writers of this age that it seems a waste of time and labor to lay before this commission any additional evidence to sustain us in our arguments. But, as a member of the committee appointed by the International Typographical Union, there is one particular feature about the present system of the Western Union Telegraph Company that our committee would like to call your attention to, because it works an injury to the members of our organization. Does anyone believe that if the Government had charge of the telegraph, as it has of the post-office, such a combine as the Associated Press would be in existence to-day? The Associated Press has the entire country in its grasp, and it is in a position to crush out, and has already crushed out, many a newspaper enterprise that dared to raise its voice against its iniquitous system. The effects of the news monopoly may be seen in any of our leading cities, and especially in the Southern cities. Take the cities of Savannah and Atlanta, in the State of Georgia, if you please, and you will find that there is only 1 morning paper in each of those cities, simply because they have the Associated Press monopoly to themselves, thereby shutting out all other newspaper enterprises, causing large numbers of our members and the affiliated trades to be out of employment, when, if the Government had control of the wires and every publisher was free to get the news at the same rate of cost to all, there would be 2, if not 3, newspapers where there is only 1 to-day. We can not have too many newspapers, for they are public educators. Nearly all the great dailies of to-day are in the Associated Press combine, and it is impossible to get them to oppose it, and few politicians care to struggle with a concern which has the power to misrepresent them 7 days in the week from one end of the country to the other, consequently it is permitted to do as it pleases.

Nearly every Postmaster-General since the war has, in his reports to Congress, advocated such a measure.

Representative C. A. Sumner, of California, said, before the House Committee on the Post-Office and Post-Roads, on March 25, 1884:

"I lay it down as a proposition that I want to have duly considered by this committee and the country that the Constitution of the United States, as interpreted by a century of unchallenged legislation, does imperatively require that the Congress of the United States shall establish a postal system. I lay it down as a fundamental proposition that the postal telegraph is a part of the postal system of the Government, the postal system of the United States having been established for the purpose of transmitting intelligence between the inhabitants of the land."

The Senate Committee on Post-Offices and Post-Roads of 1874, which numbered among its members such men as Hannibal Hamlin and Alexander Ramsey, said

in its report on the telegraph: "The Constitution devolves upon Congress the duty of transmitting all correspondence, including that by telegraph as well as that by mail."

And Justice H. B. Brown, who is recognized as one of the ablest members of the United States Supreme Court, in a leading article in a recent number of the Forum, says:

"If the Government may be safely intrusted with the transmission of our letters and papers, I see no reason why it may not also be intrusted with the transmission of our telegrams and parcels, as is almost universally the case in Europe."

In America more than 50 years of effort and appeal have failed to win the postal telegraph. Notwithstanding Vice-President Clark, of the Western Union, in his testimony before this body, referred to those who advocate governmental control of the telegraph as "his socialistic friends," such men as Henry Clay, Charles Sumner, Hannibal Hamlin, General Grant, Senators Edmunds, Platt of Connecticut, Dawes, Z. Chandler, and N. P. Hill, Gen. B. F. Butler, John Davis, Postmasters-General Johnson, Randall, Maynard, Howe, Creswell, and Wanamaker, Professor Morse (the inventor of the telegraph), Cyrus W. Field (the founder of the Atlantic cable and a director in the Western Union Company), James Gordon Bennett, Professor Ely, Lyman Abbott, B. O. Flower, Judge Clark, Henry D. Lloyd, Doctor Taylor, T. V. Powderly, Samuel Gompers, and a host of other eminent men in every walk of life and of every political shade have championed the cause of the people. Legislatures, city councils, boards of trade, chambers of commerce, and labor organizations, representing many millions of citizens, have joined in the effort to secure a national telegraph. The New York Herald, Boston Globe, Philadelphia Times, Chicago Tribune, Albany Express, Washington Post, Evening Star, and Times, Omaha Bee, Denver Republican, San Francisco Post, and a multitude of other papers, representing every phase of political opinion, have earnestly advocated the measure. More than 2,000,000 men by vote and petition have asked for it. If Congress does not pass a law to commence the good work, it will woefully fail in its duty to respond to popular sentiment. The great mass of people want the telegraph to be the poor man's mail as well as the rich.

Right here I would like permission to read an article clipped from the Washington Star, published in the book gotten up by Mr. Wanamaker of extracts from newspapers concerning the strike of 1893, to show you the position of the Washington Star, which is not considered a yellow journal:

"Talk of Government telegraphic service in connection with the Post-Office Department is again becoming quite common, based upon the prolonged operators' strike, and it is altogether likely that the proposition will gain considerable strength if the present interruption continues much longer. It is more than probable, too, that if its business is to be liable in future to further demoralization from the same cause, the managers of the telegraph interests will themselves seek a way out of their troubles by transferring their lines to Government ownership and control. They would doubtless be glad to do so now if Government or any other customer would take their property at the fictitious value they put upon it. This, however, ought never to be permitted, so far, at least, as Government is concerned; and it is not likely that private customers could be found who would be willing to pay so much for so little. Counting watered stock and all, the capital of the Western Union Company now stands at about \$80,000,000. Of this sum, however, not more than \$10,000,000, if so much, was actually paid in cash. The balance represents water, or issues of shares for which no equivalent in money or anything of value was ever rendered, and it is certain that a plant capable of performing as good service as the country now enjoys at the hands of the monopoly can be furnished for the sum last named. When, therefore, the time for negotiation between the company comes, if it ever does come, that amount ought to be adhered to as the maximum basis of purchase. If more than that sum is insisted upon, the Government should go ahead and build its own lines, leaving the present inflated concern to take care of itself."

The present private management of the telegraph is not only dangerous to a republican form of government, but it is clearly unconstitutional.

The telegraph monopoly is used and operated not for the public's good, but to make money for the few large stockholders, while our Post-Office Department is run for the benefit of all, declaring no dividends and making no millionaires.

Since 1866 committees of the Senate and House, having under discussion the various bills on postal telegraphy, have reported 16 of the bills favorably out of 18. Of the two adverse reports, one was in 1869 and was based on the ground that the 5 years allotted to the telegraph companies had not expired. The other was a short report, but the committee did not care to argue or to give any substantial reasons why the Government should not take control of the wires, while

the 16 reports favoring the measure are able and exhaustive arguments. Any fair-minded man after reading these reports will see the wisdom and necessity for the governmental control of the telegraph lines. And as to the constitutionality of the question, I beg leave to quote no less an authority than Henry Clay. As early as 1844 Clay was advocating Government ownership of the telegraph, and he wrote as follows:

"It is quite manifest it is destined to exert great influence on the business affairs of society. In the hands of private individuals they will be able to monopolize intelligence and to perform the greatest operations in commerce and other departments of business. I think that such an engine should be exclusively under the control of the Government."

And right in this connection I will also quote Hon. Cave Johnson, the Democratic Postmaster-General under James K. Polk, and that was a strict constructionist administration. This is what he said in reference to the telegraph question in 1846:

"It becomes a question of great importance how the Government will allow individuals to divide with the business of transmitting intelligence, an important duty committed to it by the Constitution. The use of an instrument so powerful for good or evil can not, with safety to the people, be left in the hands of private individuals."

The position taken by these two eminent men in public life was instrumental in causing Congress, when it passed the act of July 24, 1866, to protect itself by reserving the right to take charge of all telegraph lines thereafter built as a Government function at any time after 5 years, upon payment of the actual value of the poles, wires, etc.

And further, Judge Walter Clark, of North Carolina, one of the ablest lawyers and one of the most profound economic thinkers in the United States, said:

"Many who admit the great advantages, nay, the necessity of the telegraph being operated as a part of the postal system are deterred by the inquiry, 'Is it constitutional?' In truth, it is unconstitutional for this essential branch of the postal system to be operated by a private monopoly or in any other manner than by the Government. When the Constitution placed the post-offices in the hands of the Government it conferred its exclusive operation upon the Government, and with it all means of operating it to the best advantage. The bestowal of exclusive right and duty to operate the post-offices carried with it beyond question the exclusive right and duty to use all the agencies that would make the post-office most highly efficient as such agencies, from time to time, should be improved or invented. On this principle the first telegraph line was built by a Congressional appropriation under an Administration which, by that period in its history, had become a strict-construction Administration (Tyler's), and the telegraph belonged to and was operated by the Government from 1844 to 1846, in Polk's Administration."

The testimony of Postmaster-General Creswell, Postmaster-General Wanamaker, and of other Postmaster-Generals, in addition to the 16 reports of Congress to which I have already referred, shows conclusively that we have the poorest telegraph service in the world, not a country excepted, and that we pay a higher price for the poor service than any other country pays for a better service.

I could go on and quote for some time from most of the eminent men of the past and present bearing on the constitutionality of the question, but believe the quotations already given will be sufficient. I will therefore turn to the labor or trades union view of the question.

The International Typographical Union, numbering about 35,000 members, and considered by many the most conservative and influential labor organization in existence to-day, having among its members men in every walk of life, some of them having filled the most important positions in public life, from the Halls of Congress down to our State legislatures, has, after giving the subject careful thought and consideration, gone on record as favoring the governmental control of the telegraph, and at the forty-fifth annual convention, held in the city of Chicago in 1893, appointed a committee of five to look after all national legislation bearing on the subject of governmental control of the telegraph.

The very nature of the class of work that engages members of the craft which I have the honor to represent in part here to-day compels them to keep abreast of the times, so to speak, and when anything comes up that is likely to affect the craft in general they are very apt to take cognizance of it. So we have come to believe that the private monopoly of the telegraph is the principal foe the International Typographical Union has to meet. Nearly every member of our craft can remember when, only a few years ago, cities that supported 2 and 3 daily newspapers have only 1 at the present, the change, we believe, having been brought

about by the telegraph being in the hands of a private monopoly, which fostered and protected a monopoly in the furnishing of news to the various papers throughout the country.

Newspapers can not live without a first-class telegraphic service, and no newspaper can secure that service to-day that is not a member of the Associated Press combine. No one would attempt to doubt the statement that there are fewer newspapers throughout the South to-day than formerly. Then, why is it? Our school facilities are almost perfect, more people can read and write, and are taking a more active part in the live issues of the day, and yet a few papers have a close monopoly of the field. Only a few years ago in one of the large Southern cities, a city claiming a population of 75,000 inhabitants, a morning paper died before it was born, as it were, simply because those who had put their money into it would not (because they could not be made to see the justice of things) give those who had a monopoly of the distribution of news in the State a bonus of about \$35,000 to become a member of what they called the Press Association. That was a case that came under my personal observation, and it kept at least 40 men of my craft from securing work, to say nothing of others that would necessarily be employed in various capacities in and around a newspaper office. That is only one of hundreds of similar cases that could be cited. Therefore our organization believes that if the Government had control of the telegraph every newspaper in the country would be treated alike and receive the news at the least possible cost. We believe that a paper in California should be able to get from its special correspondent in Washington the telegraphic dispatches from this point as cheaply as a paper in New York, but as things now stand the telegraph monopoly has its powerful grip upon what should be given to all alike—the world at actual cost plus expense of operating the system.

Then as union men we do not nor can we indorse the way the Western Union Telegraph Company treats its employees. When asked how his company felt toward labor unions among its employees, the vice-president of the Western Union Telegraph Company, in his testimony before the commission only a few weeks ago, said: "The company has not changed its position since 1883." I believe I have quoted him correctly. We all remember the great strike of that year, and ever since then, nay, before then, the Western Union Company has been persistent in fighting and crushing out labor unions among its employees.

He also says that the company will treat with the men as individuals. Perhaps he does not consider the several thousand women employed by the company entitled to any consideration, for women, as a rule, are made to work for whatever their employer sees fit to give them; but a company that will not treat with a committee legally appointed to represent the wishes of the employees will not treat the individual fairly. To show more conclusively the Western Union's position on trade or labor organization, I quote from President Green's testimony before a Congressional investigation just after the great strike of the telegraphers in 1883. He said: "After the great strike of 1870 or 1871 the company took back some of the strikers on condition of their taking what was called the 'iron-clad oath'—an oath to renounce their union and never again connect themselves with any similar organization."

Evidence has been brought out during the various Congressional investigations that has proven conclusively that what President Green is quoted as saying is strictly true and correct, and that anything in the shape of getting up petitions for increase of pay or shorter hours has always resulted disastrously to the ring-leaders. They have either been dismissed from the service or discriminated against in many ways. Often their names are placed in the blacklist (and right here let me say that it has been stated many times by those in a position to know that the Western Union Telegraph Company was the first corporation or monopoly that established the blacklist after the first great strike in 1871 and again in 1883), and managers all over the country are so notified. Men have been known to give up positions to try new fields, only to find that the telegraph had preceded them; consequently they found themselves barred. So a company that is known to practice such iniquitous policies and denies the right of petition, and denies with still greater emphasis the right to organize, should not be left in control of such a powerful agency as the telegraph.

After the great strike of 1883 the Western Union refused to take the men back unless they signed an agreement similar to the one I have quoted above, but I have learned upon good authority that men have through sheer necessity been compelled to sign such an agreement, and shortly afterwards renewed their allegiance to their fellow-workers. You can not make a workman see that it is all wrong for 2 or more telegraph operators to combine to secure fair pay and reasonable hours and yet perfectly right and proper for 2 or more telegraph

companies to combine to squeeze and fleece the public. A monopoly that upon its sworn testimony claims that one-fourth of the earnings of the company was clear profit is squeezing and fleecing the public.

Let me quote the exact figures given by the vice-president of the Western Union Telegraph Company before the commission, so there will be no mistake. He said: "Our earnings for the last fiscal year were \$24,758,569.55. Our expenses, gross, were \$18,593,205.87. This left a balance of \$6,165,363.68, of which there was expended for dividends at the rate of 5 per cent, etc."

We claim that if the Government had control of the telegraph lines and kept up the present rate on messages, yet no one believes it would, the surplus of \$6,000,000 could be used in shortening the hours of the employees, increasing the pay of all employees except the few higher officials, and in making improvements and extending the lines to all parts of the country, for it is a well-known fact that the Western Union will not extend a line unless the management see where they are going to get a profit out of it. But as the wires are in the hands of a private monopoly the \$6,000,000 of profit went into the pockets of a few men already millionaires, for the vice-president of the Western Union also stated that the bulk of the Western Union stock was held by a comparatively few men. The vice-president of the Western Union also admitted that while wages have been increased during the past few years in all lines of industries, still the Western Union wages have remained about the same as they were just after the strike of 1883, and we also know that the low wages paid at that time were the principal cause of the strike. He also stated that there had been no material reduction in the telegraph rates.

The advocates of governmental control of the telegraph believe that if the Government had control of the wires the public would be given a better and cheaper service, the employees fairer treatment and better pay. In short, it would and could be conducted after the fashion of the Post-Office Department, where a postal clerk receives on an average \$84 a month, while the average pay of the telegraph operator is scarcely \$40.

Then, again, the president of the Western Union Telegraph Company said: "If the Government takes control of the telegraph lines, the only way it could make a success out of them would be to have a rigid civil-service law." But he seems to be afraid of the Government building up an army of office employees. He does not stop, it seems, to consider the great mass of citizens employed in the Post-Office Department—some 130,000, I believe. That number does not in any way endanger the public welfare. Then why should anyone have any fear on account of adding to the list of Government employees those connected with the telegraph companies?

On the question of franks, the vice-president of the Western Union testified before the commission that he did not see any harm in extending them. "It is only a courtesy on our part," he said. But he failed to state that the courtesy ended when the party using it returned to private life. Why is it that the courtesy is extended only to public officials, and especially the lawmaking branch? When asked if some favors were not expected in return for such courtesies, or, in other words, if a quid pro quo was not expected, he replied: "No; I do not know what the quid pro quo could be expected. I do not know what they could give us. When the company wants to make a fight before Congress we do not use franks, but arguments." Now, I would like permission to quote from what the president of the Western Union Telegraph Company said on the question of franks some time ago, and you can draw your own conclusion. He said:

"The franks issued to Government officials constitute nearly a third of the total complimentary business. The wires of the Western Union Company extend into 37 States and 9 Territories within the limits of the United States and into 4 of the British Provinces. In all of them our property is more or less subject to the action of the national, State, and municipal authorities, and the judicial use of complimentary franks among them has been the means of saving to the company many times the money value of the free service performed." (Western Union report of 1873. See also Wanamaker's argument, p. 164; Postmaster-General Creswell's report, 1873, p. 49.)

After the above honest and candid acknowledgment by the president of the company can anyone doubt the object the Western Union has in view when its officials issue franks to national and State government officials? Although the vice-president of the Western Union also stated before the commission that his company always tried to get hold of new inventions, he neglected to state that they have generally been successful, but that instead of using them for the benefit of the public they have been locked up in the office of the company in New York.

Another fact brought out in the testimony of the vice-president of the Western Union Telegraph Company before this commission is the acknowledgment that the company contributes liberally to the support of a school in Cooper Union that grinds out every year a large number of boys and girls as telegraphers—a regular kindergarten, as it were—using the graduates of the school to fill their offices with cheap labor. No wonder that timid and underpaid men and women are afraid to exercise their free American citizenship, which guarantees everyone the right to organize and petition, when the company is supporting a school that grinds out hundreds of telegraphers every year to take their places on the least provocation.

Look at the contrast. The telegraph companies have thousands of boys employed in carrying their messages, their ages ranging from 12 to 16 years, who work long hours and receive from \$3 to \$4 per week—boys that ought to be in school—while the fine-looking men employed by Uncle Sam as letter carriers work eight hours a day and receive from \$60 to \$100 a month.

Then, again, the officials of the Western Union Telegraph Company who have appeared before the various Congressional committees have invariably misrepresented the facts, taking advantage of every point to cloud and sometimes misrepresent facts. When they are confronted with the undeniable truth that their rates are nearly half as high again as the rates of foreign countries, they invariably meet you with this answer: "Our distances are farther, and the rates are a matter of distance," etc., and to sustain this position they have presented to committees of Congress tables of distances that have upon careful investigation proven to be false in every particular.

Prof. Frank Parsons, in Senate Doc. 205, Fifty-fourth Congress, first session, said, in speaking of the false statements made by the officials of the Western Union Telegraph Company:

"Unfortunately for the Western Union, the Washburn committee consulted geographies and telegraph maps and found that the length of telegraph routes between the cities of Europe was strangely minified in the Western Union statement, while the distances between American cities were mysteriously larger than those set down in maps and geographies. Here are some examples:

From London to—	Telegraph distances		From London to—	Telegraph distances.	
	Western Union statement.	Truth		Western Union statement.	Truth.
	Miles.	Miles.		Miles.	Miles.
Dover	50	82	Berlin.....	660	722
Plymouth	190	246	Prague.....	600	958
Paris	200	313	Madrid.....	750	1,225
Reims	250	400	Rome.....	850	1,349
Hamburg.....	340	556	Naples.....	950	1,510
Munich.....	540	800	St. Petersburg...	1,160	1,806

"Not one single distance is correctly stated. It is necessary in nearly every case to add at least one-third and often more than one-half of the stated distance to obtain the real distance. The sum of the stated distances was 15,724 miles, and the sum of the real distances was 23,578 miles, or almost one-half more than the Western Union's statement. To show the falsity of statements about American routes it was not even necessary to disturb the dust on the geography—the statement was its own refutation; for example, the distance from Memphis to New York was placed at 2,000 miles, while in other tables of the same Western Union testimony the distance was said to be 1,000 miles."

Not long ago the president of the Western Union Telegraph Company made this statement: "Not 1 man out of a hundred who uses the telegraph is in favor of governmental control of the wires." As I have called the attention of the commission in the beginning of my remarks to the fact that boards of trade, chambers of commerce, city councils, legislatures, etc., have petitioned Congress time and time again favoring Governmental control of the telegraph, I beg leave to quote the report of the executive committee of the National Board of Trade, November 15, 1882, and if the board has changed its position since then the public has not been made aware of the change:

"In 1858 the Western Union had a capital of \$385,700. Eight years later the stock had expanded to \$22,000,000, of which \$3,322,000 was issued in purchase of competing lines, while nearly \$18,000,000 were issued as stock dividends. This

was the first attempt to spread out an increased paper capital, which should hereafter afford a plausible pretext for imposing on the public an oppressive tariff of charges. The next step was the purchase of the United States Telegraph Company, for which purpose \$7,216,300 of stock was issued, an amount alleged to be 5 times the true value of the property. Next came the absorption of the American Telegraph Company. The stock of that company was almost as much inflated as that of the Western Union, and amounted, water and all, to \$3,833,100; yet \$11,833,100 of Western Union stock was issued to get possession of that line.

"Thus another illustration is furnished that in such enterprises competition always ends in combination, and the public is ultimately obliged to pay for the construction of duplicate lines which are not needed and are only constructed for the purpose of forcing a divide of the enormous sums charged the public for a public service which is a natural adjunct of the postal service."

These are not the words of such persons as Vice-President Clark, of the Western Union Telegraph, was pleased to call "socialists," etc., but of business men who are thoroughly familiar with the methods of corporations from inside knowledge. The report goes on:

"Later the American Union, whose actual value was about \$3,000,000 (franchise and all), was absorbed, together with the Atlantic and Pacific Company (also worth about \$3,000,000, franchise and all), and in the consolidation the American Union was put at \$15,000,000 and the Atlantic and Pacific at \$8,400,000, while in order to absorb in dividends the enormous earnings which they were levying on the public, a further increase of \$15,000,000 was made under the pretense of issuing stock to represent surplus earnings previously invested in the plant.

"Of course such evidence of what the public would stand in the way of telegraph charges was immediately followed by a new strike, in the form of a competing company, the Mutual Union. This company was started on a basis of \$600,000 capital, which almost immediately increased to \$10,000,000, without consideration, and, as appears from proceedings in court by a stockholder, the directors made a contract with a credit-mobilier construction firm in which they were interested, by which \$4,000,000 in bonds and about \$10,000,000 in stock were guaranteed for constructing lines and plant valued at \$3,000,000, and naturally, things being developed thus far, negotiations were opened with the controlling spirits in the Western Union for another consolidation and stock watering.

"Subsequently the consolidation was arranged and there was a further increase of stock amounting to \$15,000,000 on account of a plant the original cost of which did not exceed \$3,500,000 according to the sworn testimony of the officers of the Mutual Union."

"I have tried to present to you in as plain a manner as possible why the organization which I have the honor in part to represent desires the governmental control of the telegraph lines, and I hope and trust I have made myself understood, and I will close by saying that I believe it is as true to-day as it was in 1873, when Postmaster-General Creswell said there were but 2 parties to the question, "On one side are the people, and on the other is the Western Union Telegraph Monopoly."

Take the rural free delivery, for example. Only a few years ago, when the establishment of the rural free delivery was suggested, it appeared so preposterous that it excited only passing comment, if not derision. It was denounced by some as impracticable: it would put the Government to a great deal of expense; it was sneered at, as all reforms are more or less, as a political fad, a Utopian dream, as it were, to bring the letter to the farmer instead of compelling him to go, in some cases, several miles for it. But not one would suggest, now that they have it, that the Government should take the rural free delivery away from the public. Only a few years back there were only about 40 routes; to-day there are about 4,500, and nearly 200 clerks are required to keep up with the work in this comparatively new branch of the postal service.

Think of it. It has been over 50 years since telegraphy was first discovered; in other words, since lightning was harnessed to language and literature, and still the American people can not avail themselves of the full benefits of it at popular postal-telegraph rates, but have to depend upon a private monopoly that has never shown the least consideration for the public, a fact demonstrated beyond any question of a doubt when the company made the public pay the war-revenue tax. No one ever believed for a moment that Congress intended when the law was passed that the burden should fall upon an already over-taxed public, but the Western Union officials saw, as they claim, a technicality in the law and took advantage of it, and the public had to stand it.

I close this statement by quoting the language of Senator Edmunds, who appeared before the Senate Committee on Post-Offices and Post-Roads a few years ago: "The Government was constituted to promote the general welfare, to disseminate intelligence, to defend the country, etc., and the telegraph is essential as a military establishment, essential to education as to social welfare."

That closes my paper.

Q. (By Mr. FARQUHAR.) You mention a case there of a Southern paper which could not obtain a franchise in the Associated Press and had to go out of existence. What city was it in?—A. Savannah, Ga.

Q. Do you know of any other cases of like nature?—A. Not from my own personal knowledge. I have heard of others. Chairman Randall has spoken of one case in the city of Washington when the printers started the Washington Times, when I was on the committee to see the gentleman that had the franchise. I do not recall his name; he died a few years ago. He had the franchise and refused to sell it; would not allow the printers to use it and would not part with it.

We see to-day on the Washington Post building in large, black letters, "The only morning daily paper in town that receives the Associated Press report." There is a case where a gentleman had the franchise locked up and refused to part with it.

I will go back to the case in Savannah and how I came to have personal knowledge of it. A large German brewer in town came to me and asked the number of men it would require to get out a paper, and I told him the number it would require, etc. He knew nothing about the business, being in the beer business, and the proprietor of the only daily paper in town being a prohibitionist and the brewers opposed to him. I told him he would have no trouble in getting all the printers he wanted. He told me I could have a situation, but I said I was pretty well satisfied where I was, but he would have no trouble getting men. He said, "I want to see you later about this proposition." I saw him several weeks later and said to him, "When is this new paper going to be started?"

He said, "We have given it up."

I said, "Why, George, what is the matter?"

"Well," he replied, "we had a meeting of the board, elected our directors, etc., and found out we would have to give \$35,000 to get into the Associated Press combine; and when I explained that to my German friends, they threw up their hands in holy horror and said, 'We do not pay \$35,000 for nothing; and, besides, we would have to pay for the telegraphing every day or at the end of the week.' They could not see the justice of paying out \$35,000, which was about the amount of the capital stock subscribed."

That is the only case that has come under my personal observation. I have heard of others, like the one here in Washington. The Kentucky legislature passed a bill over the governor's veto taking the franchise away from the newspapers that do not furnish all alike. I think Senator Goebel was the member of the senate who introduced the bill, and I think Governor Taylor vetoed it, but it was passed over his veto. No; Governor Bradley was the man that vetoed it. They saw the discrimination there. Newspapers wanted to get into the field, but could not get the news at reasonable rates.

Q. Mr. Randall spoke in his testimony about 300,000 petitioners. Do you know, as a member of that committee, where those signatures came from? Were they from workmen, from business men, or from what class?—A. They came from men in every walk of life. As I have stated in my statement there, they were not only workmen, but business men and boards of trade. We could not get the members of Congress interested in it. The war with Spain seems to have taken precedence over everything in the way of local economic affairs. We could not get members of Congress interested in it as long as we were tangled up in a foreign war.

Q. Have you been quite close in your attendance on the meetings of the Post-Office committee?—A. Yes; I do not think I have missed a meeting.

Q. How far have you progressed in getting this matter out of committee? Have you been able to do that yet by bill or report?—A. No; it seemed we could never get it out of committee. They were always pigeonholing it. When the time came to report they would do one thing or another to block it.

Q. So with your petitions and these resolutions passed by these commercial and other bodies you have not been able so far to get it reported out of Committee on Post-Roads in the Senate or House?—A. No; and it is strange, because at all these hearings there are people there to represent Government ownership, while only the Western Union officials favor private ownership. It seems to be the people against the Western Union.

Mr. RANDALL. You might say that the nearest we came to getting a report from anybody was the circular that President Eckert of the Western Union issued in connection with this matter, trying to show members of Congress that we were putting them in a false light. As I stated a moment ago, it went to show that we must have moved them some, or he would not have issued that circular.

The WITNESS. Postmaster-General Wanamaker in his report frankly admitted that it was the people on one side and the Western Union Company on the other.

Q. (By Mr. FARQUHAR.) What sympathy do you receive from the publishers generally—those that have Associated Press dispatches?—A. None whatever. I could go back and quote what I said in the Washington Times some years ago as to the Washington Post's position on the strike of 1893. I wrote it up when ex-Congressman Conn was proprietor. When I read that it had passed under its present management (he did not have the paper at the time), I saw then I had made a mistake. I think Mr. Hutchins had it at the time; and the Post looks on it as a kind of socialistic idea, I think.

Q. Do you find any cooperation from newspapers generally in the country who are not in any press association—active cooperation in this plan of yours?—A. Well, yes; I did when we had the matter up before Congress several years ago, but not recently. Being the only member of the committee from the South, I made it my business to furnish some of the Southern papers with literature, and it was published by several afternoon papers; but I noticed the morning papers would not touch it at all.

Q. What bodies of organized labor have taken this matter up independent of the International Typographical Union?—A. I will answer that by saying the American Federation of Labor, and that represents all. I think at a recent convention they made it second in special legislation. The 8-hour law was to come first and after that the telegraph question; and President Gompers said recently that when they had the 8-hour law safe they would push on the telegraph with brotherhoods of the trades-union in the country, representing in the neighborhood of 1,000,000 people.

Q. Did any of the other organized bodies or trades union take action, through convention or otherwise, in helping you along with it?—A. I can not recollect that they did. We sent out, I presume, several thousand petitions asking labor unions to indorse the movement as local bodies, and upon indorsing the proposition to please notify their representatives in Congress, and I know members of the House were flooded with this petition.

Mr. RANDALL. I might say in that connection that when we organized our committee in Washington, in 1894 or the latter part of 1893, we started to organize the country. We had to do it by correspondence, and we proceeded to organize our own craft throughout the jurisdiction of the International Typographical Union, and got them to establish committees of 3, who were to report to the central committee at Washington. As soon as our committee got their report we had literature that we sent to them and put them in working order and immediately asked them to go to the sister organizations of the allied crafts and others and do likewise. Inside of 10 or 11 months we had every organization in the United States in communication with us. We have on file at our homes at the present time, also, letters from chambers of commerce, boards of trade, and business men generally calling for cheaper toll. As I stated in my testimony, we had a selfish interest in it, and the Farmers' Alliance and Industrial Union and everybody not connected with the Associated Press would like to see us secure all that, while the Western Union and large monopolies generally, as they look at it, felt that if the Western Union has to go down the line of Government ownership other monopolies would surely follow. Although as a committee we are not reformers to the extent of seeking Government ownership further than the operation of the telegraph. We did organize the country as it has never been organized before in that line, and we had a good organization. And here in Washington we adopted the means of using an auxiliary committee of members of our craft here from the different States of the Union to disseminate information. The members would communicate with people of influence, friends, and others, and also their representatives in Congress. And I do not believe that there has ever been inaugurated a movement as thorough as this movement.

The WITNESS. I mentioned the National Board of Trade, and you asked me whether there were any others besides labor organizations. Allow me to insert a list of the organizations in the National Board of Trade, which goes to show the number of trade organizations who indorsed this measure.

Q. Is there any other statement you desire to make?—A. No; if there are other questions I would be very glad to answer them, but I have no further remarks. (Testimony closed.)

WASHINGTON, D. C., April 17, 1901.

TESTIMONY OF MR. ALTON D. ADAMS,

Electrical Engineer.

The commission met at 10.55 a. m., Vice-Chairman Phillips presiding. At that time Mr. Alton D. Adams, of Boston, Mass., an electrical engineer, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Give your name and address and profession to the stenographer.—A. Alton D. Adams; post-office address, box 1377, Boston. My business is that of the investigation of engineering and economic matters—independent investigation.

Q. How long have you been on this investigation, Mr. Adams?—A. You mean the matter of investigation broadly or this particular investigation?

Q. This particularly, and all others; how long has it been a study?—A. I have been devoting my entire time to it about 2 years.

Q. Are you a graduate of any scientific school of the United States?—A. I am a graduate of the scientific school of Harvard University.

Q. Have you taken up this investigation through the State or municipal authorities of Massachusetts, or of your own volition?—A. I have taken it up entirely of my own volition.

Q. Have you had perfect access to the public documents in the State in every instance?—A. So far as I know, I have. I have also had the benefit of some suggestions by letter from the Gas and Electric Light Commission of Massachusetts.

Q. Have you had any correspondence with the other municipalities in the United States?—A. I have not.

Q. Have you any prepared paper to present to the commission?—A. Nothing more than some sheets of figures that I have here; I have no written statement.

Q. We would be pleased to have them and have your own analysis of the figures, so as to present the question as far as that investigation has gone.—A. I would say at the start a word about the object of this investigation. In looking up the matter of municipal ownership and trying to look it up for several years back, I have been impressed with the seeming fact that there are no verified figures, or, if any, very few, to be had on the subject. Various statements are published in different places as to what certain towns and cities that operate municipal plants have done, but these statements are not sworn to. They are, some of them, on inspection evidently one sided, and, so far as I know, most of such statements carry very little weight with engineers and those that know something about the actual operation of electric-lighting plants. So it has seemed to me that in Massachusetts, where, as we all know, there is a commission who gather up these data and compile them accurately and where the law obliges not only municipal plants but all companies operating electric light and power plants to make a sworn statement of their investments and of their operations—their expenses and incomes—it has seemed to me that in Massachusetts there was an opportunity to determine something of what might be done in municipal ownership compared with ownership and operation by private corporations, something that would be definite; and that has been the object of this investigation—namely, to compare the returns on the investment in Massachusetts in electric-lighting plants operated and owned by private companies with the returns on the investment of those municipalities that have gone into the electric-lighting work.

In the year 1891 Massachusetts passed a law allowing towns and cities to buy existing electric-lighting plants or to build new plants of their own under certain conditions, and since that time 17 such plants have been constructed—17 plants for the supply of electric light and power by municipalities. One of these plants was started in the last year, 1900, but that plant is not included in my report of this investigation, because it has taken some time to make this investigation and the data were not available for it. Of the 17 other municipal plants, 3 operate gas plants, and it has not been possible to satisfactorily separate the returns of those gas plants and the operation of the gas plants from the electric plants; and so, as the object was to arrive at some definite result as to electric plants pure and simple, the returns and results of these 3 cities and towns that have gas plants have been left entirely out of consideration, and this statement of my investigation is based on the 14 cities and towns that operate electric plants only. I would say as to the cities and towns operating gas plants, of which there are 3, that 2 of

these gas plants have been in operation but a short time (1 was purchased in 1899), so that, there being only 3, and 2 of them quite recent, results would not be very conclusive in any event.

Q. (By Mr. LITCHMAN.) Let me interrupt just a moment. You propose giving the names of these places?—A. Yes; that is my intention. That, I think, might well be the next point. The names of the places in Massachusetts operating municipal plants, taken in alphabetical order, are—

Mr. PHILLIPS (interrupting). State the number of inhabitants in those as you go on.—A. The places are:

TOWNS.	Popu- lation.	TOWNS.	Popu- lation.
Belmont.....	2,843	Marblehead.....	7,671
Braintree.....	5,311	Needham.....	3,511
Chicopee.....	16,420	North Attleboro.....	6,576
Danvers.....	8,181	Peabody.....	10,567
Hingham.....	4,819	Reading.....	4,717
Hudson.....	5,368	Taunton.....	27,115
Hull.....	1,044	Wellesley.....	4,229

If agreeable, I think it might be well to state also the year in which those plants were started, if the information would be desirable.

Beginning with Belmont, the dates are as follows:

Belmont.....	1898	Marblehead.....	1895
Braintree.....	1892	Needham.....	1893
Chicopee.....	1896	North Attleboro.....	1894
Danvers.....	1889	Peabody.....	1892
Hingham.....	1895	Reading.....	1895
Hudson.....	1887	Taunton.....	1897
Hull.....	1894	Wellesley.....	1892

Q. (By Mr. LITCHMAN.) You have stated that the law was passed in 1891, and you referred to Danvers as starting its plant in 1889; you had better straighten up that discrepancy.—A. The legal basis for the plant at Danvers before the law of 1891 was passed, was the common law right to light streets.

Q. (By Mr. PHILLIPS.) Does not the law prescribe that existing plants shall be purchased?—A. Yes.

Q. (By Mr. LITCHMAN.) Does not the law now provide that if a plant exists in a city or town, the municipal plant may not be established except by purchase of the existing plant?—A. My understanding of the law is that the town must purchase.

Q. And if they can not agree it is referred to commissioners to decide?—A. That is my understanding. The total amount of investment in municipal electric plants in these 14 towns and cities is \$891,591. The largest of them is but 27,000 population and the figures range from that number down to 1,000.

Q. (By Mr. LITCHMAN.) That is the total for all the towns?—A. That is the total investment in all these 14 municipal electric plants. Now, in order to compare the results attained in these municipal plants with results attained in plants operated by private corporations, it seemed necessary to reduce all the earnings of the municipal plants to a money basis. That is not done in the report of the commission, and I should state here perhaps that most of these municipal plants do two sorts of business.

In the first place they do all the public lighting in the towns and cities where they exist; and, in the second place, most of them sell energy to private consumers who may want it. Of course, the returns for energy sold to private consumers come in as a money return, but the public lighting does not come in as money; it does not stand as money in the first instance. The next step, therefore, in the investigation was to reduce this public lighting in these several towns and cities to a money basis and get the value of it. Unfortunately the prices paid for electric lighting, not only in Massachusetts but all over the country, vary through very wide limits, and after some consideration of this subject it seemed to be impossible to assume any particular figure as the value for electric lighting that would be admitted all around to be a fair figure; that is, the value of an arc lamp or the value of an incandescent lamp, because there are such wide variations in the prices paid by cities that buy their light. It did seem to be fair, however, to take a number of Massachusetts towns and cities, all as nearly as possible of the same population as those having municipal plants, and find the average price in all of those towns and cities—that is, of the number taken—paid for such service. This was accordingly done.

Seventeen towns and cities were taken, and the prices paid for arc lamps and for incandescent lamps in each were found. This price has been reduced to a price per hour. The price for public lighting is usually given by the year or by the month, by the lamp or by the lamp month; but it was found in going over the matter that the number of hours of operation and the allowance for moon-light nights and some other factors in the different towns and cities that buy their light are very variable, so that rates about the same per year turned out to be quite different when reduced to the actual hours of lighting. It was therefore decided in getting this average rate to base the rate on the actual hours of service. I have a table here of the prices paid for electric and incandescent lighting per lamp hour in 17 towns and cities corresponding as nearly as possible in population to the 17 towns and cities where municipal plants exist in Massachusetts. I hardly know how much of these data the commission would like to hear. I have a table here giving the names and populations of the several towns and cities that were selected in order to arrive at this average price—the average value per arc lamp and incandescent lamp.

Mr. KENNEDY. Give the information just as you have it.

The WITNESS. Perhaps it might be well to explain, with reference to the candle-powers of lamps mentioned in the table, that the candlepowers of arc lamps are entirely nominal; they mean substantially nothing—that is, there is no definite relation between the nominal and the actual illuminating power of electric lamps. But the lamps are spoken of in that way, and so I will use the term. The table is as follows [reading]:

Prices per hour paid for street lamps.

	Population	Prices, 1,200 candle- power arc lamps.	Prices, 16 to 25 candle- power in- candescent lamps.
		<i>Cents.</i>	<i>Cents.</i>
Pittsfield	23,671	3.6	1.02
Marlboro	14,977	3.8	.74
Amesbury	9,380	1.7	1.80
Leominster	9,211	3.2	.71
Gardner	9,182	1.8	.96
Abington	9,130	4.3	.99
Millis	8,969	4.6	1.04
Athol	7,351	5.5	1.10
Greenfield	6,229	4.1	1.40
Andover	6,145	5.1	1.07
Framingham	5,770	4.6	1.10
Whitman	5,744	5.9	.92
Orange	5,361	4.6	1.40
Westboro	5,225	4.5	1.50
Union	5,186	5.8	2.10
Winchendon	4,490	5.4	1.09
Amherst	4,785	6.9	1.50
Average cost per hour		1.7	1.2

From this table the average cost per lamp used for arc lamps is for these places 4.7 cents, and for incandescent lamps 1.3 cents per lamp hour.

I have here now the items showing the value of arc and incandescent lighting furnished for public service each of the 14 municipal plants here considered, on the basis of these average prices in private plants. I think to read these figures for the separate plants will perhaps be uninteresting, and so I will simply read the total of the figures, if permitted, and the table will be left so that the entire amounts can be published. (See Exhibit B.) The value to these 14 municipalities has been found, of course, in each case for the arc lighting and for the incandescent lighting which the municipal plant has furnished to the town, and the value of these 2 kinds of lighting in each case is added together and the total is the value for the municipality. The aggregate for the 14 municipal towns is \$173,429.40. Now, the same 14 plants in the 14 towns and cities previously named have derived an income during the year ending June 30, 1899, of \$83,948.38 from the sale of electric light and power. I should say here that the value of the arc and incandescent lighting supplied by these municipal plants to their several towns and cities, as here computed, is for the year ending June 30, 1899. (See Exhibit "C.")

Q. (By Mr. PHILLIPS.) That includes the total receipts from the city as well as from the private individuals?—A. Yes.

Q. Eighty-three thousand dollars?—A. No; that is the amount paid by private

individuals to the town for lighting and power. The value of the public lighting that the towns have had from their plants is \$173,429.40. Of course no money payment was made for that lighting.

Q. What is the sum added together?—A. The total earnings of these 14 municipal plants on the basis here stated is \$257,377.78.

Q. Have you in that connection the cost of producing that?

A. The total operating expenses of these municipal plants for the year ending June 30, 1899, was \$148,493.63, which, subtracted from the total earnings, leaves the net earnings \$108,884.15.

Q. (By Mr. PHILLIPS.) And the total cost is something over \$800,000?—A. The total investment, as previously pointed out, in all these plants is \$891,501. So that the ratio of net earnings to the total sums of money that have been put into these plants is 12.3 per cent for the year ending June 30, 1899.

That completes the first step in the inquiry. It reduces the earnings of the municipal plants to a definite per cent on the investment after all the costs of operation have been deducted.

Now I stated at the start that the object of this investigation was to show how the results in these municipal plants would compare with the results in private plants in Massachusetts. So we now pass to the private plants to see what they did during the year ending June 30, 1899.

I would again call attention to the fact that the largest of these municipal plants is in the city of Taunton, where the population is only 27,115. That is according to the census of 1895 in Massachusetts. The population at present would be slightly larger. These places having municipal plants run down in population from 27,115 at Taunton to only 1,044 at Hull. So that they are in the main in small places.

Now, it is a well-known fact in the supply of electric light and power, small towns and cities do not afford so profitable a field for that sort of work as do the larger places, so it would be obviously unfair, I think, to make a comparison or to draw conclusions from the comparison between the results obtained in these municipal plants and the results obtained in Massachusetts as a whole in the plants owned by private corporations, because Massachusetts of course has a number of large cities—one very large city—Boston, and a number of other large cities like Springfield, Worcester, Lowell, Cambridge, etc., running up between 50,000 and 100,000, that afford a large field for the supply of light and power, a much better field than the small places.

But at the start a comparison has been made with the total results from private corporations operating electric plants only in Massachusetts. This comparison does not include corporations that operate both electric and gas plants combined, because of the difficulty previously pointed out in connection with the municipal plants, namely, that the figures available are not sufficiently segregated as to the results attained in each case, in the gas and in the electric departments; so that in quite a number of cases in Massachusetts where the gas plants and the electric plants are operated by the same corporation, the results of the operation are not included in this statement. I would say, however, that none of those cases include the largest cities. In none of the largest cities, namely, those I have mentioned—Boston, Springfield, Worcester, Cambridge, etc.—in none of these cases is the electric lighting and the gas plant controlled and operated by the same corporation. In some of the smaller places such is the case, but these places are left entirely out of the comparison, and there are only a few of them.

Now, taking the private corporations that operate electric light and power plants in Massachusetts as a whole, Boston included with the other large cities, the investment in these plants has been computed on a basis of the capital stock, bonds, and the notes payable. These items are: Capital stock, \$10,926,030.40; bonds, \$3,771,200; notes payable, \$1,933,215.46; a total investment of \$16,630,445.86.

A word of explanation might be made with reference these three items as representing the actual investment in the plants. Of course, as we all know, capital stock and bonds of corporations in Massachusetts, or corporations operating public plants, can only be issued for money or its equivalent actually paid in. So that these stocks and bonds represent actual money paid into the plant to their face amount. Under the Massachusetts law they must do that.

Now, as to these notes payable. I believe from what I have noted from various sources that they represent substantially additional investments in the electric plants beyond the amount of the capital stock and the bonds. I wrote the commission in regard to that point and they wrote me that the notes payable of these several corporations in most cases did represent investment, but that in some cases they would represent losses. Well, to my mind it looks to me as though the money has gone into the plants and as the item in all is only \$1,933,215.46, and if most of that represents investment, according to the commission, and another small but undetermined part represents losses, which seem to me to be

also investment, I concluded to let the items stand as I have given it—as investment in the plant. It looked to me as if that much money had been into the plant.

Mr. PHILLIPS. Or a debt of the plant, which was the same thing.

The WITNESS. To revert for a moment. Remember I am trying to compare the private and the municipal plants all the time. In the case of the municipal plants the investment included everything—every dollar put into the municipal plant, and I want to get as near to that as possible for these electric plants owned by corporations. In the latter case the investment of \$16,630,445.86 earned during the year ending June 30, 1899, above expenses, \$1,699,365.96. This represents a ratio of net earnings to investment of 10.2 per cent, in contrast with the 12.3 per cent made in the case of the municipal plant. It should be borne in mind in this connection that this comparison takes in all the large cities of Massachusetts except 2 or 3 good-sized towns, where the electric and gas plants are owned by a single corporation, and consequently takes in fields that are much better and that are supposed to be much more profitable for the sale of electric light and power than the small cities where the municipal plants exist. So that the figure of 10.2 per cent, whatever unfavorable bearing it may have on the results of the municipal plants, if it has any unfavorable bearing—for it is less by some 2 per cent than the figure reached in the municipal operating—it should not be given much weight.

The next basis of comparison was to take all the electric plants operated by private corporations in cities and towns of Massachusetts, each having less than 30,000 population. It seems that in this way we could come to a fair basis of comparison. The largest place operating a municipal plant has 27,000 population, and the cities and towns run from that down to 1,000; but there are 43 cities and towns in the State of Massachusetts having populations of not over 30,000, in each of which the electric-lighting business is conducted by a private corporation. The capital stock in all of these 43 cities and towns that we are now considering amounts to a total of \$1,823,000, the bonds amount to a total of \$1,201,700, and the notes payable to \$773,262.56, making a total investment of the electric light corporations in these 43 cities and towns of less than 30,000 population of \$3,797,962.56. The total earnings or incomes of these 43 plants during the year ending June 30, 1899, was \$814,768.54; operating expenses, \$568,700.87, leaving net earnings \$246,067.67. The ratio of net earnings to total investment above given was 6.4 per cent, as compared with 12.3 per cent, which was shown to be the earnings of the municipal plants in the 14 instances cited. That concludes in outline what I have to offer on this subject.

Q. (By Mr. PHILLIPS.) Would you please state again the net earnings of those 40 towns?—A. The net earnings of the 43 cities and towns just mentioned was \$246,067.67.

Q. And then the profit on those; what per cent did they pay?—A. They paid 6.4 per cent on the investment.

Q. (By Mr. LITCHMAN.) You made your calculation entirely on the 1,200-candle power for arc lights?—A. I did.

Q. Did you reduce the 2,000-candlepower lamps to the 1,200 basis?—A. I did not. I will explain what I did do. All municipal plants except 1 or 2 have the nominal 1,200-candlepower arc lamps. All of the plants operated by private corporations in the 17 cities and towns taken to reach the average value of arc lighting, had 1,200-candlepower arc lamps. One or two municipalities had 2,000 power lamps, but had such a small number that I did not think it worth while to make that additional allowance for them. The small error, such as it is, counts against the municipal plants and not in their favor.

Q. Some of the plants furnish light only, and do not furnish light and power. Are they of sufficient importance to distinguish between the two?—A. I can not see any important point there. There are only 2 or 3 of the plants, as I remember, that furnish power at the present time.

Q. The point would be, if they did furnish power, the cost of operation while they were furnishing power ought not to be charged against the cost of lighting, ought it?—A. The plants exist there; they do all the business that comes in, and they have attained these results. The plants existing in the other cities and towns, operated by private corporations, take all the business that comes in and they attain these other results.

Q. That is a fair comparison. That is right.—A. I suppose the reason that so few of the municipal plants furnish power is that there is very little call for electric power in those small places.

Q. Is not the real reason the fact that it has been permitted by law only about 2 years?—A. I am not sure as to the legal point, but I still think the other reason applies, because I think if there had been a demand for it before the last 2 years there would have been an effort to have the law changed, if it is a fact that the law did not permit it. I know it is a fact, from knowledge of the electric business, that there is little demand for power in the smaller towns. One of the cases

where power is furnished is in the city of Taunton, where we have a fair-sized place; but in the small places there is very little demand for power. I think if there had been much, if any, demand we would have seen the municipal plants going after that privilege long before.

Q. Would the extent of territory over which the lines run affect the cost?—A. Yes; because in the smaller places you have a greater length of wire, and presumably a greater investment in lines of wire in comparison with the amount of power you can sell.

Q. It is difficult to consider that problem in the statement you have made, is it not?—A. Yes; I could not well bring that in, as it would require data that I have not by me. But it is a settled fact that the larger places are more favorable to good earnings in the electric light and power business.

Q. It is claimed that there is a larger expense in the larger cities by reason of the regulations compelling the establishment of conduits. Have you taken that into consideration?—A. No, I have not taken that claim into consideration; but I would point out that, in the first place, any fair comparison between these municipal plants and private plants must be in the nature of the second comparison to which I have called attention, that with towns and cities of a similar size, and in that case there are no regulations of that sort. Now, for curiosity, I did put in a comparison with all the towns and cities in Massachusetts, and that was more favorable to the municipality. My opinion would be that in spite of such regulations as do exist in the large cities they still offer a better field for electric lighting; but it is not necessary to consider them at all to get the force of this comparison here made, because there really a different problem comes in. It is not fair to compare little places of 1,000 population with the city of Boston.

Q. And it is only in the larger places that the regulations for burying the wires exist?—A. Yes.

Q. And the comparison made with the 43 towns is where the conditions are practically the same?—A. Yes; under 30,000 population.

Q. Did it combine also the urban and rural districts in about the same proportion?—A. Presumably; at least there was no distinction purposely made. It took in all the places in Massachusetts where private corporations operate lighting plants and do not operate gas plants. It took in every one of them, so that there was no picking out of cases that would be favorable to a certain conclusion sought to be reached.

Q. In Massachusetts a city can not be established with less than 12,000 inhabitants.—A. Is it 12,000 or 10,000? If my memory serves me, I was thinking it was 10,000.

Q. Either 10,000 or 12,000. So all the places you have mentioned of less than 10,000 inhabitants are necessarily towns?—A. Exactly.

Q. And necessarily distinct from the urban?—A. Yes. There is no reason to suspect that the municipal plants are in places that are closely huddled together and the private plants in places that are scattered, as we have taken all the instances of each kind; and it is fair to suppose they average up about the same conditions. We have taken all the plants in cities and towns under 30,000 population operated by private companies.

Q. Do not the reports of the gas commissioners give the comparisons by the cost per lamp and not the cost per lamp hour as you give it?—A. They do give the cost per lamp, but they also give the number of hours operated per day, and the number of days operated per month in all these plants, and it is possible by arithmetic to reach some definite conclusion.

Q. You think the comparison made by you per lamp hour is fairer to both sides than the cost per lamp?—A. I think it is a definite basis, and the other, until you reduce it, is indefinite. A price per lamp year does not mean much until you know what is included under the lamp year.

Q. And how long the individual lamps are run in that year?—A. Yes; that is the point I mean.

Q. (By Mr. PHILLIPS.) How do you find the people to be satisfied, as a rule, in your visiting these towns and making your examination?—A. I think that the people are very well satisfied with municipal ownership; no town has relinquished its municipal plant. Last year there was a very nice little municipal plant built in Concord, one of the best.

Q. Have no municipal plants been bought out by private corporations?—A. No.

Q. Have the municipal authorities bought out some of the private corporations?—A. Yes; in several cases.

Q. Is it not true that the regulations of the State which compel the purchase of private plants has deterred many localities in establishing municipal lighting plants?—A. It is unmistakably my understanding that that is the case. There are cases in which failure to agree on price, when some municipalities are willing to buy, has left the matter in such condition that the transaction has not been

gone ahead with, where it would have been gone ahead with if the field had been clear.

Q. (By Mr. FARQUHAR.) Are we to understand from your testimony that the municipal plants, the 14 you mentioned particularly, cleaned up 12.3 per cent, and private plants in the same kind of cities cleaned up 10.2 per cent, and the whole 43 cities below 30,000 population cleaned up only 6.4 per cent? These statements having been made by you, can you make an explanation of the divergence between the 43 cities, 6.4, and your municipal ownership towns at 12.3? Do you know if there are any figures of depreciation at all in your plants? Do you know whether there are any funds set aside for depreciation? Do you know whether the cities—the municipalities—whether the city bookkeeping, municipal bookkeeping, and the private bookkeeping differ in the matter of depreciation as to the item in your plants?—A. The municipal plants must charge a depreciation of not less than 5 per cent per year by law. So far as I am aware there is no fixed per cent of depreciation fixed for the plants owned by private companies, and without being able to state the exact figure at which such depreciation charges are made, my impression from looking over the returns of the plants owned by private corporations is that they do not average anything like a 5 per cent charge for depreciation; that they did not make anything like so large a charge—a much smaller charge.

As to the explanation why the municipal plants show 12.3 on the actual investments, while the 43 cities and towns of similar size show only 6.4 per cent on the investment, it is my opinion that the difference results mainly from the more efficient and careful management in the municipal plants. Of course the people in these small places, where these municipal plants are operated, are very jealous of any unnecessary expenses or anything of that sort. And the Gas and Electric Light Commission is also watching the matter, and it is not possible for these municipal plants to run into excessive outlays or to operate at a loss. They are not to sell at a price that will produce a loss; they must stop selling to private parties rather than to sell at a price that will produce a loss.

The cost of street lighting from municipal plants is found for each case in the following way: All expenses of operation and management for the municipal plant during the year are first found. From these expenses is then deducted the income from commercial lighting. To the remainder are added interest on the entire investment in the municipal plant, at the rate paid on municipal bonds or notes, and also depreciation at 5 per cent on the cost of the plant. The sum of these three items is the cost of municipal lighting for the year. The total time in hours of operation for each lamp is known, and the cost per hour is computed by dividing the total cost of street lighting for each town among the several lamps in proportion to the energy that each lamp consumes.

Another way to ascertain the economy of public electric plants is to compare the actual cost to the municipalities of operating their plants with the prices charged by private companies. The following table has been prepared from official returns.

Cost per hour of operation of electric lamps from municipal plants, including interest and depreciation, year ending June 30, 1899.

[Cents per hour.]

	Incandescent lamps, 25 to 32 candle- power	Arc lamps, 1,200 to 2,000 can- dlepower.

It will be noted that in the majority of cases the cost per hour of lamps operated by municipal plants is lower than the average price paid for similar lamps when operated by private corporations. In a number of instances the municipal costs are only one-half of the contract prices.

True it is that some of the contract rates are lower than some of the municipal costs, but it should be held in mind that any town may have a low cost for street lighting from a municipal plant at will by good management and the use of efficient equipment.

On the other hand, towns that now pay a high contract price for street lamps seem to have no remedy, unless they put in municipal plants.

If I may add a word to my testimony previously given, I would like to say with reference, further, to this comparison, that while I have made out no table showing the comparative charges made for electric energy of municipal plants and private corporations, still I would state that on the whole the municipal plants sell their energy quite as low to private consumers, if not lower, than do the other corporations. There is not a great difference, but the result, as reported in the reports of the Gas and Electric Light Commission, is, if anything, a little lower for the municipal corporations than for the private plants, so that their better showing on the investment can not be due to the fact that they charge the townspeople a higher price for energy, because they have not charged any more than, if as much as, have the private companies.

Q. (By Mr. FARQUHAR.) You said that in the 14 cities there was no gas competition; that you took out 3 cities that you claim had both gas and electric plants, the other 14 cities having only electricity. Is there gas competition there with electric lighting? Can you name any one that has private competition against the municipal control? I am asking the condition where the municipality is the competitor with the private gas company. That is the point I want to get at.

The WITNESS. There are in some of these places gas plants where the electric light is owned by the town or city, but I would like to refresh my memory for a moment as to the places. If I may answer the question partially now, I would call attention to the city of Taunton, which has a gaslight company with a capital stock of \$80,000. That is the largest place having a municipal electric plant, and there is a gas company of very good proportions for a place of 27,000 population (\$80,000), and my general recollection is that there are a number of places where municipal plants have also gas plants. There are private gas works in eight of the towns having municipal electric plants.

Q. (By Mr. LITCHMAN.) In the case of the gas plant, does not the field covered very materially affect the cost of the investment per light?—A. It affects it to a considerable degree. The extent of distribution of gas is quite a large per cent of the total cost. I won't state the per cent, or attempt to do so, but that is lower than electric-light energy.

Q. I will vary my question. What I really meant to ask was, is not the cost of the small plant relatively a little more than the cost of the large one?—A. Of which variety?

Q. Both; each.—A. Yes, undoubtedly.

Q. Then, in a town having a small gas plant, the price of the gas—the price at which gas was furnished—may be higher in a large town with a large plant, and yet the return on the investment not be any more, if as much?—A. Quite so. As a matter of fact, I believe the plants in the smaller towns are almost always higher than in the larger towns of Massachusetts.

Q. (By Mr. PHILLIPS.) But are there any cities or towns which own the gas plants?—A. There are three which I purposely left out, because the accounts of the gas and electric light were mixed up.

Q. Are there many cities that own their own waterworks in Massachusetts?—A. Oh, yes; it is a very general practice with a large part of them.

Q. Has there been any comparison made there between city ownership and individuals in regard to the cost of furnishing water?—A. I have never seen any; that is one of the things that I have in mind, but I have not gone into the matter.

Q. You do not know where the commission could get statistics of that kind now, to show the difference of cost?—A. Oh, yes, I know the documents from which that information could be gotten in Massachusetts. It would involve a lot of analysis, just the same as we have gone into here. Most of these figures were taken out of a book, but they came out of the book as a matter of analysis.

Q. Are there any cities and towns that own their own street-railway systems? There are none in Massachusetts that own street railways?—A. I think not.

Q. (By Mr. FARQUHAR.) What is your observation in respect to electric lighting in municipalities supplanting gas?—A. The observation that I would state in

reference to your question is that the electric light supplants gas, not on a question of price, but on a question of quality, where it supplants it at all. That is, so far as public rates and public lighting is concerned. It is possible to put in what is termed an insulated electric plant; that is, if one has a large amount of lighting at any factory plant, or for his office building, it is much cheaper under certain conditions. Under conditions that pertain to the heating of a building, etc., so that an engineer has to be employed, it is much cheaper to put in a small electric plant and light with electric plants, than it is to light a building by gas. That is a growing practice in all large cities of the country, and rightfully so; but so far as lighting derived from the public supply is concerned, electricity can not, I believe, in a great majority of instances, if at all, compete with gas strictly on a price basis, and it is selected by the great majority of users, not because it costs less, but because they like it better.

Q. (By Mr. LITCHMAN.) Is that condition intensified to appliances consuming gas, like the Welsbach burner?—A. The improved burners that you speak of, which materially increase the candlepower per foot of gas consumed per hour do tend to cut down slightly the field of application of the electric light; that is, they give the gas an advantage that it would not otherwise have, in that they give gas lighting a quality that some consumers will accept instead of buying the electric light. This still leaves the gas the cheaper form of illumination, but they cheapen the illumination of our gas very decidedly, and also improve, in the opinion of some consumers, the quality of that illumination.

Q. (By Mr. FARQUHAR.) You gave the figures from 1892 to the installation of these electric plants; do you know of the installation of any gas plants in that time?—A. The 3 gas plants, as I endeavored to state.

Q. Just 3 and no more?—A. Just 3.

Q. Then it seems to be the policy of the towns of Massachusetts to adopt electricity instead of gas where they pass out of the reign of coal oil?—A. Judging by experience, yes.

Q. Where you mentioned the fact of the net results of 6.4 per cent here in the 43 cities, and the 12.3 per cent in your 14 cities of municipal control, would it not seem that really the private individuals are making less money now than the municipally owned properties?—A. It is a fact, shown by these figures, that the capital invested by towns and cities in electric-light plants is more economically invested for the community, and is earning a better return than is capital invested through the medium of private corporations operating such plants.

Q. So, you would say that the owners in 43 cities, that clean up each year 6.4 per cent, are not monopolists nor robbers of the public?—A. I should say, on the contrary, that they are not getting a fair return on their investment. The question that I have particularly referred to in this matter is that as to whether municipal plants can be expected to be, or are being, managed as well or better than private plants.

Q. (By Mr. LITCHMAN.) When you say that 6 per cent and a fraction is not a fair return on the capital invested, you think in Massachusetts, at least, there is not an overcapitalization, either by stock, bonds, or notes?—A. No; there is no overcapitalization there, as I see. There may be injudicious investment, of course, if that is what you mean. I should not care to stand with the proposition that all those private corporations have been operated only, for instance, as an engineer in that line of business would advise to operate them; but I say the money has been invested there, well advised or ill advised.

Q. (By Mr. FARQUHAR.) Are the men who officer your municipal plants in Massachusetts taken from a civil-service list, or how are they employed?—A. As far as I am aware there is no formal civil-service list in connection with them. The officers are simply employed on their reputation as men competent in that line of work.

Q. Just as any business enterprise or corporation would employ?—A. Yes. Or just as a town or city operating a waterworks plant would employ an engineer for that plant. I do not think there is any civil-service examination.

Q. Have you ever heard in Massachusetts that politicians have interfered to put men in these plants?—A. I have never heard of such complaints. I have heard of complaints about politicians interfering in some other lines of work in Massachusetts, but as to this particular thing I never did.

Q. (By Mr. LITCHMAN.) Is it not a fact that the managers of all these municipal plants are elected by cities and towns as a rule? Of course in the cities they may be appointed by the mayor and confirmed by the council, but in general are they not elected at town meetings?—A. I so understand it.

Q. In that case, then, they have to run according to public sentiment?—A. I suppose if a plant is not well managed that the tenure of that office—

Q. (Interrupting.) Would stop. Is there anything further you might add?—A. I think of nothing to add.

(Testimony closed.)

EXHIBIT A.—To accompany Mr. Adams' testimony.

Municipal electric plants in Massachusetts.

	Popula- tion.	Year started.	Invest- ment.
Belmont.....	2,843	1898	\$16,000
Braintree.....	5,311	1892	67,067
Chicopee.....	16,120	1896	98,950
Danvers.....	8,181	1889	45,174
Hingham.....	4,819	1895	24,413
Hudson.....	5,308	1897	45,273
Hull.....	1,044	1894	119,367
Marblehead.....	7,671	1895	85,518
Needham.....	3,511	1893	15,697
North Attleboro.....	6,576	1894	58,421
Peabody.....	10,507	1892	79,010
Reading.....	4,717	1895	74,400
Taunton.....	27,115	1897	145,301
Wellesley.....	4,229	1892	17,000
Total investment in 14 plants.....			891,591

EXHIBIT B.—Value of lighting by municipal plants.

	1,200 can- dle-power arcs, hours per year.	25 to 32 can- dle-power incandes- cent lamps, hours per year.	16 candle- power in- candes- cent, hours per year.	Value, arc lighting.	Value, in- candescent lighting
Belmont.....	17,741	215,846	\$833.82	\$2,590.15

Needham.....	506,479	6,077.75
Value of each kind of lighting.....	125,877.55	47,551.85
Value of both kinds of lighting.....	173,429.40

EXHIBIT C.—Earnings and expenses of 14 municipal electric plants for the year ending June 30, 1899.

Incomes from commercial lighting.....	\$83,948.38
Value of public lighting.....	173,429.40
Total earnings.....	257,377.78
Operating expenses.....	148,493.63
Net earnings.....	108,884.15
Total investment.....	891,591.00
Ratio of net earnings to the investment.....per cent..	12.3

EXHIBIT E.—Total investments by electric companies only on June 30, 1899.

Capital stock	\$10,926,080.40
Bonds	3,771,200.00
Notes payable	1,983,215.46
Total investment	16,680,445.86
Net earnings of electric companies only for the year ending June 30, 1899	1,699,365.96
Ratio of net earnings to investments	per cent. 10.2

Investment for electric plants in 43 cities and towns of less than 30,000 population each on June 30, 1899.

Capital stock	\$1,823,900.00
Bonds	1,201,700.00
Notes payable	772,262.56
Total investment	3,797,862.56

Results of operation for electric plants in 43 cities and towns of less than 30,000 population each for year ending June 30, 1899.

Total earnings	\$814,768.54
Total operating expenses	568,700.87
Net earnings	246,067.67
Ratio of net earnings to total investment	per cent. 6.4

WASHINGTON, D. C., January 7, 1901.

TESTIMONY OF PROF. WILLIAM Z. RIPLEY,

Professor of Economics at the Massachusetts Institute of Technology.

The commission met at 10.53 a. m., Vice-Chairman Phillips presiding. At that time Prof. William Z. Ripley, professor of economics at the Massachusetts Institute of Technology, Boston, Mass., appeared as a witness, and being duly sworn, testified as follows:

Q. (By Mr. PHILLIPS.) Will you please give your name?—A. William Z. Ripley.

Q. Residence?—A. Boston, Mass.; my occupation is professor of economics at the Massachusetts Institute of Technology.

Q. How long have you been teaching in that institute?—A. I graduated there as a civil engineer, then studied 3 years, and went back there in 1893, and have been teaching since 1893.

Q. Have you any other information you desire to give about yourself personally before proceeding to the questioning?—A. Nothing further than this: I should like to have it appear to the commissioners that a good deal of the information that I shall have to present has come from contact with railroad men and with shippers. Our graduates at the institute are represented in almost all of the manufacturing industries of the country, and a great many of them are on the railroads. Our policy has been always to keep in close touch with them as to the details of their business so far as they can be of interest to us; and I should like to free myself from the prejudice of appearing as an academic specialist, and should like to speak to you, if I may, from the standpoint of one who has talked with the representatives of these business interests. After receiving your invitation to come down here, I have spent a good deal of time in seeing a number of railroad, cotton mill, and other manufacturing men in Massachusetts, in an endeavor to get at something as to the present situation in New England, because I believe the present situation in New England will illustrate distinctly the evils and the advantages of the present state of the law. In other words, in

this small territory we have a picture presented of the conditions which I have been led to believe exist all over the country. I offer that merely as an explanation of the concerns from which most of my information which will interest you has been derived.

Q. From practical concerns?—A. I have tried as far as possible to check up all the results which we obtain from books by a conference with our graduates in business.

Q. Then you can proceed in your own way to make a statement, and we will take the liberty of interrupting you as necessary.—A. The first point which I may speak upon, perhaps, is as to the existence—the very widespread existence—of rate cutting under the present interstate-commerce law. Rates are being cut in New England to-day, to the best of my information, anywhere from 30 per cent to 40 per cent on west-bound traffic. I was informed by a representative of one of the large roads, a man with whom I have personal acquaintance, that, in his judgment, there had scarcely ever been a time when there was more rate cutting on west-bound business than there is in Massachusetts, and has been for the last 2 months. The reason for that, as near as I can discover, is that the large amount of exports and the large amount of traffic going East has thrown a great many empty cars upon the seaboard, and that there is great competition among the roads for filling those cars to the West. All of our manufacturers derive a very considerable benefit in competition with other parts of the country by reason of the differential Canadian lines—the Canadian Pacific and the Grand Trunk—those roads not being subject to the interstate-commerce act, which gives them a definite advantage ranging anywhere from 10 cents up per hundred pounds on freight to Chicago. The manufacturer of Massachusetts, as I know in one or two instances, can put freight into Chicago in normal times for from about, we will say, 10 cents on first-class freight less than a shipper from New York can do, although the distance is 150 or more miles farther. The situation, then, at present is this: Those differentials exist and have been approved by the other roads in this country. They have been approved, of course, as a matter of force. They have at the present time offered so much of an obstacle to the trunk lines wholly within the United States territory that those trunk lines have now begun to cut under the differential, and traffic which for a great many years has been going over the Canadian lines is now being diverted over some of the main trunk lines. One of the large interests in Massachusetts, which has, I am informed, for nearly 20 years shipped a large proportion of its freight over the differential lines, is now shipping over the trunk lines. I give that merely as an illustration of what is taking place in almost all the industries. These shipments, however, are not due to the desire of the eastern trunk lines to cut rates. It is forced upon them by the situation. The far-western connections of these lines, apparently, are desirous of securing business which shall be diverted to their lines by the eastern trunk lines; and they notify their eastern connections that any business diverted to them will be taken at a considerable cut, leaving to the eastern trunk lines, which have, I believe, honestly tried to maintain rates, the policy of either taking business and transferring it to their western connections at a reduction, or of letting it go over some other competing trunk line. The situation has been forced upon the eastern railroads against their will. A number of the men whom I know have told me that they would be only too glad to follow the law and keep up rates, and that they would welcome any amendment of the interstate-commerce law which would enable them to maintain rates, but that under the present conditions it is beyond their power so to do.

Q. (By Mr. PHILLIPS.) Then you have absolute knowledge that there are discriminations in the freights?—A. I have absolute knowledge.

Q. Would you specify the roads?—A. I will specify them so far as I have done, that they are the main trunk lines within American territory that make discriminations of this nature. I will give you another example, if you will permit. The freight rate from Boston to Seattle, which is the same rate from all points east of the Mississippi River, is at the present time on first-class freight, I believe, \$1.25 per hundred pounds. One of the large shippers told me that he was shipping now without asking the different roads for competitive rates, without any friction whatever, at 95 cents.

Q. From Boston to Seattle?—A. From Boston to Seattle; although the established rate is \$1.25, I believe. I have not verified this rate in the tariffs, but it could be done very quickly.

Q. (By Mr. CLARKE.) Had there not better be a distinction made at this point between rate cutting and discriminations; discriminations may be in favor of individuals, while rate cutting may be equal to all?—A. I am very glad to have the correction. I believe that both of those conditions exist; that certain shippers

are obtaining rates which are, we will say, 35 to 40 per cent less than the published rates, whereas those—of course this applies to those who ship less than car-load lots—those who are shipping without the large volume, which always lends inducement to cut rates, are paying nearer the established tariff. That is what you mean by discrimination?

Q. Yes.

Q. (By Mr. FARQUHAR.) I would like also to have this distinction brought out in the rates that you are speaking of now: were they all rail or were they rail and water?—A. Some of the differential rates are part rail and part water; for instance, those that go over the Rutland Railroad and then up the St. Lawrence. I have no knowledge as to the difference in discrimination between all rail and part rail and part water rates. I have sought from various lines to verify this fact that the trunk lines are forced by western connections to cut rates, and that much more business is going over the trunk lines that formerly went over the Canadian roads, and further, that whenever there is rate cutting it follows almost invariably that that leads to personal discrimination; that the competition which rate cutting presupposes leads to a deeper cut for the large shipper, or for the person who is shipping from a competitive point; whereas a rate remains more nearly at the established figure where the shipment is made from a local station, or is made by a person who is shipping small amounts. It will also vary, of course, very largely according to the regularity of the shipment. One man told me that November 1, an agreement between the roads that they would maintain rates was made by some official or by general instructions privately sent out. The day following that 1st of November this man found that serious cutting was being made by a competitor. He asked the reason why, and he was told that it was a continuous contract; in this case, for apples, running over a period of 4 months. I asked him as to the way in which rate cutting proceeds. He informed me that he was forced by the conditions of business to make a similar cut, and he informed his competitors that he also was working under a long-time contract, or as they call it in the railroad business, a "hold over." The result is that by this subterfuge the rate cutting continues, and the agreement made the 1st of November, and the attempts made to recognize the same seriously, on the 1st of December came to nothing. I almost universally have found from conversation with men who are in the railroad business, that they would be glad to maintain rates on our Eastern lines—I know nothing of Western lines—they would be glad to maintain rates if they could do so, but the very conditions of business, the competition especially in our part of the country between lines subject to the interstate-commerce law and lines not so subject, forces them to the kind of business which I have described. The feeling which was forced in upon me by that experience is very strong that the maintenance of rates at an established figure is fully as important a matter for the business men as is the fixing of reasonable rates by such a body as the Interstate Commerce Commission. To fix reasonable rates is entirely a distinct matter from securing the maintenance of such established rates as are already published by the railroads. They are not able at the present time to accomplish the second of these two ends. One railroad man, a shipping agent, told me that his road had never instructed him to cut rates, but that they sought to prevent it; and he felt that those higher in authority than himself would welcome anything which would protect the roads against rate cutting and the consequent discrimination as between persons.

Q. (By Mr. PHILLIPS.) You think that the rate cutting leads to discrimination between persons? It is pretty difficult to separate the two, is it not?—A. One necessarily leads to the other; in times of general rate cutting personal discriminations are bound to arise.

Q. They will cut rates to one and probably not to another?—A. They will cut deeper to the one than to the other. The Interstate Commerce Commission at the present time has not the power to prescribe freight rates in advance. They do not have this power because of the decision of the courts; but if the roads are to be allowed, under an amendment of the law, to pool and to prevent this rate cutting, there certainly must be some protection for the public, through securing for the Interstate Commerce Commission the right to adjudicate as to what rates shall be reasonable.

Q. For the future?—A. For the future; or to pass upon them. I feel very strongly that there are rights upon both sides which must be very jealously and carefully guarded. A railroad has the life and death of the manufacturer in its hands. I remember—it must have been 5 or 6 years ago—talking with a banker in Boston; some of the details escape me; I remember hearing this gentleman tell of an attempt to establish a paper-pulp factory at Denver. I do not know whether it has subsequently been established or not. They desired to utilize

the raw material which was in the West, and to manufacture paper of the sort used by the newspapers, and to save the expenses of transshipment from pulp mills in distant parts of the country. They were notified by one of the roads that if they established a pulp mill at Denver, which would prevent large shipments of freight which had formerly come from Wisconsin, that the road would kill that business at any cost. The promoters were very much discouraged. Whether they actually carried it through or not, I have no personal knowledge.

Q. The object of the road, then, was to get the freight on long haul instead of a short one?—A. Instead of a short one.

Q. You state that they can make or break the manufacturer. Is that not equally true of the miner of coal and ore, and other producers of commodities?—A. I believe so.

Q. And have you knowledge that they have crippled such industries in any case?—A. I can not state of my own personal knowledge. I merely know that Government reports and official documents make statements to that effect. There is a large mass of official information which bears upon that point, but of my own personal knowledge I can not speak.

There is another point which I think deserves careful consideration here, namely, that the roads in many respects are distinctly at the mercy of the shippers. This is the other side of the same question. I am now seeking to express my own conviction that it is an interrelation; that the railroads have rights, and that the public has rights. A shipment of dry goods is made from New England, boxed and marked, we will say—cotton goods of a certain grade. Those goods, as cotton goods, go, we will say, at second or third class rates. The shipping agent—the man who secures the contract—can never be sure from his personal knowledge whether that case is filled with cotton goods which should be rated second or third class goods, or whether they are really half cotton goods with a large proportion of first-class goods which ought to go first class. In one other example—which I give as coming from New England from an agent of one of the roads—a certain firm had been shipping for a long time a certain grade of cotton goods. Gradually the proportion of shipments of goods of a very considerably lower class became common. The freight agent had reason to suspect that those boxes were containing freight which ought to have gone in a higher class than that which was specified. I asked the agent why he did not attempt to determine for himself. He replied, "My dear sir, that is entirely beyond our power. If I should question that firm the freight would never go over our line again. We have got to accept it at the class at which they specify." The result of such underclassification prescribed in that case by the shipper is, of course, to give very considerably lower rates than otherwise would be charged. The complexity of this situation forces itself upon me every day—the thousand and one ways in which the object of, we will say, personal discrimination, or rate cutting, may be obtained. It may be by a direct cut in money. A Western road, for instance, depositing, we will say, \$25,000 in a Boston bank to the credit of a certain New England freight agent. He is authorized to draw upon that for cash which he pays out in rebates, the shippers of course paying by check for the full amount of the established rate, that being a matter of record. It can not be traced, or it is almost impossible to trace the amount of that cash when a few dollars or a hundred dollars has been returned to a certain firm during the month as rebate. That same discrimination may take place by the acceptance of freight which is classified at a lower rate than the rate at which it is supposed to go, although, as I have said, in that particular respect the roads are very largely at the mercy of the shippers. They must rely upon the good faith of those who make the shipment. Or again, of course, discrimination may take place by the process of underbilling, the shipment being made at a rate for a long through haul. The freight is then taken off at an intermediate point, to which the local rate would be considerably higher than its proportion of a through rate. But, however it be done by any of these devices, the existence of rate cutting and of personal discrimination is very widespread, and I am constrained to believe that it is no less to-day than it has been during a good many years past. Conditions vary. The local situation in New England may for a short time lead to widespread rate cutting. As, for example, the condition which I have described, namely, the existence of a large number of empty cars going West at a particular season when the industries of that section of the country may be sending out goods. I would say also here that the existence of discriminations in rates as between, we will say, 2 or 3 different shoe manufacturers, is of far more importance to each one than the absolute level at which those rates stand for all alike. It is of far more importance to the shoe manufacturer to know that he is paying 75 cents for a given service when his competitor is getting it for 50 than it is for him to know that both are not paying 75 and 50, but 40 and

25. It is not the general level of rates, but it is the fact that at a given time one set of rates is very much higher than another. That is what determines the success or destruction of a given business.

Q. (By Mr. CLARKE.) That is to say, they would rather pay a higher rate and have it uniform than to get a low rate when a competitor possibly gets a still lower one?—A. That is precisely my point. A manufacturer said to me the other day that it did not make so much difference to him absolutely how much freight rate he had to pay. The question was, how much was his competitor paying. That phase of freight rates enters very largely into the competition at present arising between the cotton mills in Massachusetts and New England and the cotton mills in the Southern States. The existence in a very large part of the Southern States of what is practically a pool makes the freight rates into and out of those Southern States considerably higher than in those parts of New England where competition still prevails. There are only two parts of New England where there is railroad competition to-day—along the line of junction of the Boston and Maine Railroad and Fitchburg territory, and of the New York Central, that is, of the Boston and Albany; and secondly, at the line of contact of the latter and the New York Central, and the New York, New Haven and Hartford on the south. I am informed that there is a good deal of feeling among the people in southern New Hampshire, southern Vermont, and northern Massachusetts, along the line of territory in which formerly competition between the Boston and Maine and the Fitchburg railroads existed. Those two roads have now become amalgamated, and the result is that a number of places like Peterboro, N. H., for instance, which formerly had the benefit of low competitive rates, now find that rates are appreciably higher. Nevertheless—and this I believe is worthy of emphasis—the rates, while somewhat higher, are certainly steadier. There are complaints that the rates are indeed higher, but manufacturers have told me that they would much rather have higher rates which can be depended upon. This brings us back to the point which was touched upon a little while ago; they would much rather have a higher rate, and know that rate was going to prevail this week and next week, and that every man in that territory with whom they were competing in manufacture was going to pay the same rate. I think it may be predicted that the effect of consolidation or pooling, if you are pleased to call it such, is likely to be a maintenance of higher rates, perhaps a lesser reduction to some degree than might take place otherwise. But the effect of the combination or of the pool would be to make a steady rate, and a fixed rate, which the manufacturer or which the public can rely upon, and which they can feel is paid by everybody. The effect of that will be a welcome one to the people concerned. The authorization of pooling, however—and I have thought a good deal about that particular question—giving the railroads absolute control over rates, would be, if it had such an effect, to place the public still more in the power of the roads than they are to-day. Any proposition to legalize pooling, it seems to me, should have inextricably bound up with it some increase of regulative power of the Interstate Commerce Commission. For instance, at Peterboro, N. H., which now is a noncompetitive point—the Fitchburg road and the Boston and Maine being amalgamated—rates are fixed by different considerations than those which formerly prevailed. Peterboro should feel that it has somebody at Washington that will give protection, with power to pass upon the reasonableness of the new rates. To show you how this works I will give you one other illustration which came to me directly from the field. A certain gentleman controls some 10 country stores all through the towns of northern Massachusetts and southern New Hampshire. His control amounts to the management of their affairs indirectly from Boston, where he acts as a purchasing agent. The town of Jaffrey, N. H., is 6 miles from Peterboro. Jaffrey was formerly served by one road, and still is. Peterboro was a competitive point at the junction of territory between the Boston and Maine and the Fitchburg railroads. So much lower were the Peterboro rates formerly on shipments that all the goods for the country store in Jaffrey were hauled a number of miles by horse in order to take advantage of the competitive rates of Peterboro. Since that territory has ceased to be competitive freight is no longer hauled by horse, because the Peterboro rate and the Jaffrey rates are just the same. The effect of that upon the distribution of business is very considerable.

Q. (By Mr. PHILLIPS.) Did they bring the rate up to Jaffrey or down to Peterboro?—A. The rate, as I understand it, is brought up to the Jaffrey rate. But let me return once more to the statement formerly made, that it is not so much whether the rate is slightly higher or slightly lower, but that it is the same for everybody. In other words, there is no incentive for roads to cut rates and make personal discrimination. Therefore a business man and shipper can calculate what his cost is going to be, and especially the conditions under which he is competing with the neighboring town.

Q. (By Mr. A. L. HARRIS.) I would like to have one point cleared a little. Taking New England as a center, and the Pacific slope as the point of destination for through freight, how would you eliminate the Canadian roads from competition with the American roads?—A. I can not see any way at present. I recall the section of the Dingley Act of 1897, about which so much has been said in the newspapers, which provided for a discriminating tariff against all goods carried in bond. That section, it was said at the time, was imposed through the influence of lines within the American Trunk Line territory. At all events the effect of it would be to impose a discriminating duty upon all goods which went over those lines, with the result of prostrating practically every industry in New England. Our people are very far from raw materials. We have nothing but our climate and our people to rely upon; the distance from the great centers of population and wealth are such that it would be one of the greatest disasters for New England which could happen that it should be deprived of that little advantage which they have of shipment over these Canadian lines. As it will appear from the map, these lines are not very much more devions to Chicago than are the shipments through the United States. Our manufacturers all feel very strongly on that point; whether rightly or not, it must rest with each man's judgment to determine.

Q. Now, another question in connection with that of pooling. Suppose Congress should place in the hands of the Interstate Commerce Commission the right to approve rates of the different lines of railroads, and protect that rate after it was approved until changed. Would not that substantially bring the redress that you ask for by pooling?—A. You mean that that should be done without the authorization of pooling?

Q. Without pooling, yes.—A. I should say not. The only way to stop rate-cutting is to do away with competition. The railroad is a monopoly for this reason, that the more business it does the cheaper it can do it. Nobody else can come into the field when the road has an established line—two or four track line—and begin business at a tenth of the tonnage which that old road is carrying, and in any way compete profitably with it in rates. A four-track road can charge a great deal less per ton-mile than any smaller road can do. The trend of affairs is to force business into the hands of those who can do a large business at decreasing cost.

Q. Would it not be worth trying, at least, to give the Interstate Commerce Commission the power to approve rates, and then see that the roads sustain them?—A. I believe that that would be a distinct advantage to the country.

Q. (By Mr. LITCHMAN.) Would that reach the evil of shipping high-class goods as low-class goods?—A. Not unless it gave the right of inspection. I have felt at various times that that was a point which has not been tried out in many cases; that many shippers, even of moderate volume, have it in their power to trick the railroads if they choose to do so, and the larger they get to be the more they can force the continuation of that same policy. A railroad may, if a man is only shipping one small box of dry goods, put on an inspector and actually have the matter determined, but if it is a large shipment which they can not afford to let go to some other road, they must wink at it and let it go.

Q. (By Mr. PHILLIPS.) Without some pooling process could the Interstate Commerce Commission take up each single road and fix a schedule for it? Could it physically do it without a much larger body than what there is now?—A. I should say it would very greatly multiply the duties of that body; but do I understand you to mean to ask whether the commission should make the rates itself, or simply pass upon the reasonableness of the rates made by the railroads before put in force?

Q. (By Mr. A. L. HARRIS.) Not to make the rate, but pass upon it?—A. That is a different matter than suggested by the chairman. I believe that should be done. I think it is an important element in any amendment of the interstate-commerce act; but I question very much whether this practice which is so widespread of rate cutting and of personal discrimination—which can not be stopped by the railroads, though many of them would be glad to do so—could be stopped by an administrative body at Washington.

Q. If that legislation is upon the statute book, would not the roads desiring to comply with the law have a very great influence in causing the other roads to comply also through the Interstate Commerce Commission?—A. I think it would have a good effect; yes. Whether it would be enough to meet the almost inevitable condition of business, which is that of either cut-throat competition or pooling, is another question. It would certainly contribute to that end.

Q. It would hardly be expected, of course, that it would be eliminated entirely, but would it not go a very great ways?—A. It might.

Q. (By Mr. CLARKE.) On the other hand, would not that law bind the conscience of the honest railroad managers who desire to avoid rate cutting, and be as much disregarded by the other class as the present law is?—A. I feel strongly convinced, as a matter of personal judgment, that the soundest roads in this country would be glad to do away with the rate cutting and personal discrimination which is loaded upon them by a great many of the trusts. At the present time they are carrying these trusts upon their shoulders. They can not help it. They have grown so large that they can dictate rates of freight, and the roads have no choice. They must either take the goods or see them go to some competitor. If any means could be devised by which this could be stopped, and at the same time some protection for the people set up in an enlargement of the powers of the Interstate Commerce Commission, it would seem to me to be a fair give and take. The railroads would receive what they undoubtedly wish—the power to pool; the people would receive a considerable enlargement of the powers of the Interstate Commerce Commission, enabling them to pass upon rates in advance of the time they are put in force. I believe that the desire of the people and of the roads for these two things would bring them together to some degree.

Q. (By Mr. PHILLIPS.) Do you think that the railroads at the present time care a very great deal about pooling? Have they not consolidated in such a manner as to make their own rates?—A. That is a point to which I was coming.

Q. Do you know anything about this new combination amongst the railroads which has been formed in the last year by an interchange of stock, etc.?—A. I have followed some of this with a little care, and took the liberty of bringing some diagrams illustrating the character of certain railroad securities. The railroads, prohibited from pooling, are planning by financial consolidation to reach the same result. This makes it still more imperative, as you suggest, that the enlargement of the powers of the Interstate Commerce Commission to prescribe reasonable rates should follow.

Q. Have you followed the consolidation of the Baltimore and Ohio and the Pennsylvania system that has occurred in the last year?—A. In 1893, at the period of depression, at which time so many roads were in the hands of receivers—something like one-quarter of the mileage of the United States (I believe it was mileage)—I began to collect material upon the reorganizations and receiverships of those roads, and followed that as far as spare time would permit, together with the growth of the systems, and the effect of the leases, working arrangements, consolidations, or purchases which have taken place. The reorganizations principally which should be taken as typical would be the Reading, the Baltimore, the Southern Railroad, the Central of Vermont, and one or two others. The effect of those reorganizations upon the amount of capital stock and bonds out has been very great; and the number of virtual reorganizations, the most striking of which is the reorganization of the Chicago and Alton, have forced the conviction upon me that most of these reorganizations which were intended to cut down capitalization have had exactly the reverse effect. The road comes out of the reorganization with a lessening of its fixed charges, to be sure. That is, the financiers have been enabled to issue new classes of bonds at lower rates of interest, but the aggregate par value of stock and bonds is almost always greater than it was. Take the case of the Atchison and Topeka, which has been reorganized three times since 1889. It began in 1889 with a capitalization—that is, stock and bonds—of about \$205,000,000. It was reorganized in 1890, and the stock and bonds were increased to upward of \$300,000,000. In 1894 it was again reorganized, and the stock and bonds were swollen in amount to \$329,000,000. Whether the public ought to be called upon to pay a normal rate of interest upon that enormous aggregation of capital, some of which represents increase in the value of property, some of which represents promoters' profits, and some of which represents pure water, is a question which should be very carefully thrashed out. I have been looking over, during the last 2 or 3 days, the case of Danville and Lynchburg in Virginia, which has been before the Interstate Commerce Commission. A large factor in their determination of the case turns upon the existence of the enormous capitalization of the Southern Railroad—a capitalization which has been put upon that railroad through its recent reorganization. The question of reasonableness or unreasonableness of rates rests upon the amount of actual investment that there is in that road. The railroad declares itself to have a capitalization of \$120,000,000. They are entitled, as they contend, to earn a living interest and dividend upon that basis. The Interstate Commerce Commission answers, Not so; a large part of that capital is fictitious, and we deny that you have a right so to earn. The Interstate Commerce Commission does not know; the people do not know; nobody knows but the people who own that road, and possibly also they have no data as to how much actual money has been put into that property. It seems to me that the determina-

tion of some of these questions, the relation between the reorganization, refunding, and consolidation of the roads and the amount of actual property that is in them, should lie at the basis of the determination of what rates are reasonable or what are not. In other words, we must cut loose, if we are going to determine how much each road is entitled to earn, from consideration of this superficial figure of stock and bonds. In some roads it is greatly swollen, and in some roads it does not represent more than the actual investment. I take the liberty, Mr. Chairman, of referring to an article in the *Quarterly Journal of Economics* for November, 1900, upon the working of our corporation laws in Massachusetts in the matter of capitalization, in which I endeavored to point out the serious attempt we have made in Massachusetts to keep capitalization down to the actual investment. There is not a Commonwealth in the country which has succeeded to a greater degree than Massachusetts, by antistock-watering laws, in holding down capitalization to the actual investment made. And may I say here that this at once points to a suggestion for control which I have not as yet expressed, namely, that the increase of the powers of the Interstate Commerce Commission, by enabling them to pass upon all financial operations of the interstate roads, with power to regulate issue of stock and bonds, to approve of the terms of leases—to do, in other words, all those things which the Massachusetts railroad commissioners are empowered to do by law—would give the Interstate Commerce Commission just that hold over the roads which they apparently need at the present time. For instance, the Massachusetts railroad commissioners have no power to prescribe reasonable rates. That is, perhaps, the fundamental difference between our Massachusetts railroad commission and that of many Western States. The people have never empowered that body to determine what rates are reasonable and what are not, but the corporation laws of Massachusetts are made so strict that no railroad in Massachusetts can issue a dollar's worth of stock or bonds, can lease another road, can build another spur or side track, can do anything of that kind, without getting the prior approval of the railroad commission. What is the result? The roads feel that unless they accede to recommendations of the railroad commissioners in matters of rates, unless they voluntarily acquiesce in recommendations of that nature, that some day next week or next month, when they wish to carry through some financial operation, that that body will have power to withhold its consent. Do I make it clear? That is the sole weapon which our Massachusetts railroad commissioners exercise over the roads, and in our history has accomplished many of the results that seem desirable.

Q. (By Mr. CLARKE.) Are you aware that some years ago, when the Housatonic Railroad refused or neglected to comply with a recommendation of the commission for the reduction of rates at certain points, the commission reported the facts to the general court, which was then in session, and that the general court immediately authorized the railroad commissioners to fix rates on that road?—A. Of course that is an additional weapon. I did not know of that case; I am very glad to have it for my own information. But that, of course, should be taken into consideration, namely, that there is a genuine conviction on the part of the roads that the legislature will stand by the commission, ready to empower them if necessary. But under ordinary conditions, those of everyday life, I am told that its power to pass upon all financial operations, to approve all leases, reorganizations, issues of securities, etc., is sufficient for regulation and to make the railroads acquiesce in such suggestions as are made by the railroad commissioners.

Q. (By Mr. A. L. HARRIS.) Has your law been oppressive to corporations in its execution?—A. It has, to the degree that several of our large corporations have migrated from Massachusetts. If anything, our law has been a trifle too strict.

Q. (By Mr. CLARKE.) You refer now not to the railroad law, but the antistock-watering laws?—A. The antistock-watering laws. The law says specifically that no corporation shall issue stock except to the amount of actual investment in tangible, physical plant. A lawyer told me the other day that he was called upon to organize a small business corporation which was manufacturing electric fans. The patent for those fans was the foundation of the entire business. They went to the corporation commissioner and asked for authority to capitalize the value of their factory and of their assets, plus \$3,000, which they entered on their balance sheet as "patents," and the commissioner of corporations said, "No; a patent is not tangible, visible property, and we can not allow you to capitalize it, but you may borrow money to the amount of \$3,000, purchase that patent from some member of your own corporation, who will act in an individual capacity; then you can show upon your books that you have paid out \$3,000, so that that purchase of a patent for \$3,000 may be capitalized." I give this merely as an illustration, to show that in some details the Massachusetts law leans a little bit over backward.

Q. (By Mr. LITCHMAN.) Does not that also show that you can whip the devil around the stump if you want to?—A. It does; but it shows that if you compare the capitalization of our Massachusetts companies with those in other States you will find that the devil has been whipped less times around the stump than in other States.

Q. (By Mr. PHILLIPS.) Is the Massachusetts law too strict, or are the laws of the other States too lax?—A. I should say at once that the laws in the other States are too lax. If the United States could regulate corporations in the way the State of Massachusetts has regulated them, at great cost to itself—I mean at the cost of emigration to other States where they can do what they wish—I believe that the abuses could be mitigated to a considerable extent.

Q. Then you would be in favor of a uniform law in the States in regard to capitalization of corporations and public utilities?—A. I believe there is nothing that would make matters easier for Massachusetts. Our labor laws in Massachusetts are so strict that our people would welcome, more than anything else, laws which would level up the regulation of such business to the Massachusetts standpoint. There is no denying that in many cases, in two-thirds of the grants to municipal-service corporations in Massachusetts, they have gotten around the laws by reason of special exemptions; but taking the State as a whole the corporations are very much less overcapitalized, so that you may predicate pretty closely the value of the property by the figure of the capitalization. For instance, in Massachusetts the average capitalization of our street railways, exclusive of Boston, is about \$37,000 to \$40,000 per mile. The average capitalization of the street railways in Pennsylvania, of Philadelphia at least, is something like \$120,000 a mile; and in New York State it is in the neighborhood of \$100,000 a mile. I will cite directly from an article in the Quarterly Journal of Economics for November, 1900, to prove that fact in detail. For Massachusetts street railways the capitalization per stock and funded debt in 1899, according to the Massachusetts railroad commissioners, was \$46,600 per mile; of the New York street railways it was \$177,000; that is, more than four times. Pennsylvania was \$128,000 per mile. Whereas the capitalization of the steam railroads in the United States, with all their expenses of right of way, of grading, of stations, etc.—the capitalization, according to the last report of the Interstate Commerce Commission, was \$80,000 per mile.

Q. (By Mr. LITCHMAN.) In that connection, do you take into consideration that in some of the cities in some of the States the street railway has to pave the entire width of the road, while in some other cases they only pave between tracks?—A. In Philadelphia they do that, paving the entire width of the road, I believe.

Q. That would make a difference in the cost per mile?—A. Of course, the actual use, the actual service to which this capitalization in the different States was put, I did not intend to raise at this point. It was merely to show that our Massachusetts corporations do not incorporate for anywhere near the aggregate amount of par value of stock and bonds per mile which is customary in other parts of the country.

Q. If the other roads are compelled by the conditions surrounding them to pay a larger cost on establishing plant, is not the larger capitalization per mile justified?—A. It is. I should like to qualify what I have said. Low capitalization does not necessarily mean the removal of evil and abuses. It depends entirely upon circumstances. A road which represents a small investment of capital, which is conducting business at a very narrow margin, may be capitalized at \$28,000 a mile, and that may be excessive—that may be twice too much. Another road which may be capitalized for \$80,000, or \$80,000, or \$100,000 per mile—represented in the property and in the earnings of that capitalization—would not be overcapitalized. It should depend entirely upon the nature of the business.

Q. You suggested that there might be a remedy for this discrimination and cutting of rates by pooling among the different roads, approved by the managers of those roads. The question arises there, Would there be any safeguard for the general public if the managers of the pools were engaged in enterprises that benefited by the discrimination in rates?—A. I should say no.

Q. Would not the very fact of the pooling of rates for the general public give to the special favorites of the pool a still larger advantage than they enjoy at the present time?—A. That presupposes entirely that the pool is able to control the railroad—that the pool and the trust, if I may use that phrase, are in the same hands. They are. The railroads and pools are undoubtedly tied up together. There is hardly a large trust to-day which does not own enough track so that it can make shipments on a joint rate. For instance, the large steel and wire company at Cleveland, I believe, has some 37 miles of track. Why do they keep that? Solely because, operating as a railroad corporation, they are enabled to make joint

rates, and their shipments are made over this 37 miles of track, then going over the track of a larger railroad. The celebrated Counselman case, which determined the powers of the Interstate Commerce Commission, was raised by the Illinois Steel Company, which, owning several tracks around Chicago, was enabled to use those tracks to secure low joint through rates, which would not have been quite so low if the shipment had originated and terminated under the same corporation.

Q. Have you thought along the line of Government ownership and control of trunk lines?—A. I have thought about it; and if the service could be maintained as our post-office service is, if it could be maintained as the Government service in Germany is, and all be in the control of the United States as an entirety, certain of the abuses at the present time might be eliminated. Whether others would arise it is not my purpose to question here; but this point I should emphasize, that when it is done it has all got to be done at once. In Belgium they tried Government ownership alongside of private ownership, and the result was that the Government had to come down to the level of cut rates and personal discrimination and everything else in order to live. They had to be just as low in their tariffs as the private roads. When Government ownership comes, if it ever does, it is my own personal judgment that it must be effected in such a way that competition between the Government roads and private roads shall not arise and force the Government road to the level of the other road. The higher rate does not pull the cut rate up to its level; it is the lower one that forces the higher one down, as a rule.

Q. (By Mr. PHILLIPS.) Are you going on the principle that the Government can not transport as cheaply, that it must come down to the lower level? The theory is that it would be cheaper, and it would not therefore be cut by the private roads.—A. Practically, the whole problem is so complex, as I see it to-day, that I should hesitate very much to predict what might happen in such a case. It undoubtedly would cure many of the abuses of the present time. Whether it would give rise to others more serious I should hesitate to say. But I can say this, in my judgment, that when it was done it would have to be done as an experiment for the whole country at once; and the amount of capital involved at the present time is so great that that removes it as a possibility for some years. Ultimately it may come. In Germany the service, as I know it—I have traveled a good deal on the foreign roads—the service is good, but it is not at the level of our American efficiency by any means, and that is by reason of the absence of competition. The question of facilities offered to travelers is just as much subject to variation as is the rate charged. This is the greatest difficulty in our Massachusetts and New England territory, which is practically pooled. You may observe the practical effect of pooling if you will go anywhere north of the Fitchburg road up to the boundary of Canada, the entire territory being subject to the Boston and Maine. The result is seen definitely in the facilities offered. There is not that competition which keeps the service up to the high level of efficiency. People are obliged to be content with slow trains, with fewer trains, and with many other inconveniences. For instance, how long would the Chicago and Rock Island Railroad and those other roads in competition with it, which give you a reclining chair for the ordinary fare, be able to operate if in a run of 150 miles its trains were sidetracked three times in order to let cattle cars pass and the train on that run were two hours and a half late? That is the experience of a friend of mine in our territory recently. On the Rock Island, or the C., B. and Q., or any of those roads, they know perfectly well that if they do not give quick trains and good service—and here we are leaving out of view rates—the traffic will go by the other lines. And if you have consolidation so that people have got to go one way or not at all, that is to say, if there is no competition, all the roads keep on the same level. It is therefore more difficult to improve the facilities offered unless there is a body somewhere which has the power to prescribe what they ought to be.

Q. (By Mr. CLARKE.) Was not that preference given to cattle trains due to the necessity of landing that freight at the port for connecting with a certain vessel?—A. Entirely; either that or else that the freight was perishable.

Q. Would not that occur under Government control or under a pooling arrangement in the same way?—A. I think it might, except that a road which was under competitive conditions, like many of the Western lines, would simply have to put in double track or much more double track in order to meet that condition. I do not mean to say by any means that that is typical of the whole situation, but I mention it as a possible effect of the absence of competition in service.

Q. Is it not a fact that since the Boston and Maine acquired control of the Eastern Road, which was a close competitor, it has largely increased the train service to almost all competing points?—A. It is; and the comfort of the public is vastly greater than it was many years ago.

Q. Is it not a fact that that company has begun the use of coke as a fuel in locomotives largely for the purpose of reducing or overcoming the nuisance of smoke and cinders in trains, even at a possible greater cost than the burning of soft coal?—A. I can not say as to that on the Boston and Maine. I know that on our local service, on the Boston and Albany, they have used coke, and it is a most intolerable nuisance in producing gas instead of smoke. We have gas now in the cars to a very objectionable degree. I would say also that recently the Boston and Albany has discontinued the use of coke on its through trains, owing to its serious defects as a fuel. It is used only in suburban service, I understand. But I would not be understood as saying that the instance I gave was typical of the whole service of the Boston and Maine. The combining together of all those lines, the Boston and Maine taking the management of the whole, with larger trains, has vastly increased the convenience of the public. What I wished to illustrate was this: That where there is not competition there is a tendency to hold back; there is not that incentive which becomes a matter of self-preservation to add the very latest and very best improvements which must prevail where competitive conditions exist.

Q. Now, does not that depend largely upon the enlightenment and breadth of view of the railroad management and also upon the competition that exists, which may be even remote, at which would tend to draw business from that section?—A. Yes; the railroads of Massachusetts appreciate—as I believe all the better railroads of the country do—that their prosperity is inextricably bound up with the prosperity, nay, with the very existence, of manufactures and a growing population in the districts which they serve. The only question is this: Whether a given tonnage shall come from twenty sources or whether it shall come from a thousand sources. That is, whether a railroad operating purely as a financial concern may not make as large earnings from a small number of consolidated concerns, thus minimizing the cost to the railroad by making shipments in bulk and in a definite way, as they could otherwise from the existence of a number of manufactures scattered through many small towns. I recall a place in Rhode Island where there is a large 4-story stone factory, constructed in the substantial style of the old mills in the New England States, which has been idle a great many years. The machinery has been taken out, the windows are boarded up, and it is a very depressing object in the landscape. I asked the reason why that factory was abandoned, and was told that it was not because it was more expensive to manufacture at that particular place than formerly, but that it had become very much cheaper to manufacture in some other place and that it was the better railroad facilities in other towns which had affected that district. I do not mean that that industry has moved out of Rhode Island or out of the territory of that particular road concerned, but it has gone into Providence; the capital has gone into Providence, or it has gone into Pawtucket, or it has gone into some one of the larger towns. I believe the direct effect of the prevention by some means or other of this local and personal discrimination in the matter of rates would lead to a much more widespread distribution of industries in the small towns of the country, with less of this aggregation of industries in particular centers where they get the benefit of competitive rates. No manufacturer to-day will locate his plant where he is not going to get the benefit of through rates and of competitive rates, if possible, although a definite department in our railroad businesses—and the Western roads are particularly enterprising in this respect—has to do with the stimulation and encouragement of industries within their territory. The sole question here is as to whether there shall be a few large industries or a great number of small ones.

EXPLANATION OF DIAGRAM.

I should like to illustrate a point which we have not considered, namely, the effect of the long and the short haul clause in the interstate-commerce act [producing Diagram I]. I think Diagram I may bring out certain points of interest in regard to local discriminations. It represents the local freight rates on the Illinois Central Railroad on its main line from Chicago to New Orleans. This was made by one of my students. We plotted along the base line, mileage, showing the different stations, with the number of miles in proportion to the distance from Chicago at one end or to New Orleans at the other. The height ~~and off~~ at any given point thus fixed indicates the published rate to that station ~~as we took~~ it from the tariff of that railroad. In other words, at the station of Mattoon, Ill., the railroad rate from Chicago to that particular town is about 45 cents per hundred pounds, we will say, on first-class freight; it is about 30 cents per hundred pounds on third-class freight, and it is about 15 cents per hundred pounds on fifth-class freight. The general direction of the lines connecting the various

points for each way station fixed in this way will indicate whether over a long distance rates tend to increase in proportion to that distance or whether they tend to remain almost constant. You will observe this very common phenomenon under the operation of the long and short haul clause; That often over a stretch on some of the Western railroads of two or three hundred miles the freight rate will not vary at all. The line drawn as I have described will run perfectly horizontal. Where the line descends, as at a point like Cairo, Ill., you have got competition. The reason why our curve varies or turns so little—that is to say, why the freight rate over 100 miles is almost as much as it is to Cairo, Ill.—is because the long and short haul clause prohibits these local rates from being any higher than at that competitive point. That competitive point is fixed as to freight rates by the conditions of business. Then the railroads have to work back from these points and get as much as they can out of the intervening territory; that is, they endeavor to hold the rates up on all these local stations just as near that level as they can, avoiding infraction of the law. That is the theory. See how it works in practice. Cairo, Ill., like Boston, Mass., or Worcester or Fitchburg, or any place which is at a competitive point, comes in apparently at this published rate; but, in fact, it often secures a secret rate which carries it away down. All these local stations are then paying the full rate which is published in the tariff, but this particular competitive point is getting a great advantage. What is the result? Population goes there, industries go in there, and that place, like all the large towns in Massachusetts, practically absorbs the whole increase of population for that district. I have found 11 towns in 1 bunch in the Berkshire Hills where the population is practically the same that it was 75 years ago, and yet the population of Massachusetts and its wealth go on increasing. Instead, however, of its being distributed all over the country, it is bunched in these places where you have this discrimination and all these facilities. This means the difference between success and destruction to a business man; and the little industries which are at way stations have either got to move into the large town or be destroyed.

Q. You recognize, however, that that is only one factor in the determination of the gravitation of people to central places?—A. Perfectly, with the social factor and a great many others; but I think that this is a patent one, which should be considered. The fact, as I view it, would be that while on the published tariff it looks all right, as if everything were entirely in accordance with the provisions of the interstate-commerce act, yet in fact at every one of these competitive points there is liable to be a big drop in rates, which is giving an advantage to that town, to that section of people, or to that industry, or perhaps to a particular industry, which is a big one, in that particular place. That is to say, you have got several advantages piled one on top of the other, and it is at such favored places that you find the plants of the great industrial organizations located. They have the option in many different parts of the country of simply closing up one establishment here, closing up another there, and simply putting all their force at work at 1 station. Then they can put in 2 shifts of men and can increase their machinery, so that at a given point, such as this competitive one, they can turn out as much product as 3 mills at other places could do. Those mills at the other places remain closed down at least during periods of depression, and are merely held as reserve agencies to meet the very greatly increased demand which appears in times of prosperity.

Q. (By Mr. FARQUHAR.) Suppose you continue your description of the diagram beyond Cairo, southward.—A. At once they put on all they could to the next few stations, and again having raised it as much as the traffic will bear, the line again goes on more horizontally to the next competitive point. As you go down, finally to New Orleans, of course you see that the traffic is bearing all that it possibly can at that level until you get a sudden drop to the margin of water competition. Of course, with the railroad at water competitive points, you can not have your rate any higher to New Orleans than it would be by some other road or rail and water route combined.

Q. The Illinois Central has strong water competition at Cairo, stronger than any other point on that whole road?—A. Yes; except for local freight rates which are not on that river. The section off from the river is not held down to the low level of the river rates.

Q. I mean on through freights.—A. On through freights. This measures the rates from any one of those stations down to New Orleans.

Q. Your diagram would show, then, that measurably the water transportation from Cairo down to New Orleans does not seem to be able to keep the rates down on the Illinois Central, an almost parallel route to the river?—A. Not on this branch of the road.

Q. That is the main line?—A. We are dealing with local stations, and the local rate from such stations over to the river to obtain water transportation rates would be prohibitive.

Q. But, granting that from Cairo to New Orleans the locals on the Illinois Central are very high, traffic is very light?—A. I suppose it is.

Q. And you say the great through carriage is the one that has to be considered, and yet you find on your diagram that the cheap water rates seemingly have no way of bringing down this rate, which just increases until it reaches the Gulf?—A. The local rates, yes. The through rates would be absolutely different, and the through rates are fixed by the competition even of the trunk lines to Newport News. The through rate from Chicago to New Orleans can not be more than they can ship goods for to Newport News and around by steamer. This simply applies here to all those local stations which can not get down to New Orleans by water or by local shipment over the river.

Q. (By Mr. A. L. HARRIS.) The through rates would be represented by the line from Cairo to New Orleans?—A. Yes; that is, the through rate from Chicago to New Orleans, and you see how much lower than the local rate it is. We have plotted a great number of these diagrams for the different roads of the country within the last year, and on some of the long distance Pacific roads you get a very striking phenomenon. The rates will rise suddenly and then they will run for 200 or 300 miles perfectly even. In other words, as you go through their freight tariffs the rate will be absolutely the same—it may vary a fraction of a cent—for 300 or 400 miles; it will be held down until you reach some competitive point, and then it will take another jump and thereafter run along on a level. But the point I wish to make is, that at each of those competitive points there really is at any time a cut very much below the published tariff by reason of the rate cutting, which always arises when conditions are ripe for it.

An interesting and valuable investigation would be an inquiry into the financial effect of some of the recent reorganizations. For instance, after the reorganization of the Reading Railroad, on the main line from Philadelphia to Mount Carbon, they have no less than 8 different classes of securities; and then they have on each of the branch lines which run out another different class of securities, issued at a different rate of interest for a different term of years, under long terms of lease, which may be more or less advantageous to the branch line or to the parent company. The reorganization is generally intended to wipe out that very great complexity of interests and to substitute, as in the case of the Union Pacific reorganization, perhaps 2 or a single class of securities applying over the whole line. It very greatly simplifies the problem of determining how much capitalization there is and what the relation of the capitalization to earnings in any particular case is. The financial organization of some of these roads and the history of them should be worked out in some way in order to establish landmarks in railroad history for future reference. In the Hepburn investigation in the legislature of New York, we have a clear picture of the state of railroad finance and misfinance up to that time, and in the Cullom committee of 1884 we have a statement as to that period. I hope—and this is the opinion of the professional class to which I belong, and also I believe of the public—that your commission will through some means put in definite form, while the evidence is still available, the history and the inside history, so far as it can be determined, of all the great reorganizations and consolidations which have taken place since 1893. There are 6 or 7 prominent reorganizations which should be considered, and the growth of present systems, especially such combinations as have taken place in the last 3 or 4 days or are seemingly projected for the future, such as the combination of the Milwaukee and St. Paul, of the Northern Pacific and the Great Northern, and possibly of the Erie. Such consolidations mean a great deal to the public in the amount of securities which are issued by the terms of the lease or purchase, and the public have a right to know what those terms are. Fortunately you can always get information on those points because invariably in any such dealings there is a class of dissident bondholders or stockholders who only crave the opportunity to reveal what they know or what they think they know respecting the transaction; and very much interesting and highly valuable information, from the public point of view, may be forthcoming by choosing a few of such men who have an interest in the road, and whose interest it is to talk about it afterwards.

Q. (By Mr. PHILLIPS.) When this consolidation occurs on these lines of which you speak, the reorganization usually pays on its own capitalization, and also for the leased road's interest on the stock and interest on the bonds?—A. That depends entirely on the terms of the lease.

Q. In a great many cases that is the case?—A. Yes.

Q. And then on the same system of roads they are paying 3 or 4 different kinds of interest?—A. Yes.

Q. And in that way they can have more fixed charges, can they not, and not issue any new bonds?—A. I understand that that was their result formerly. I have not had time to go into it fully enough to work over some of the most recent reorganizations, but I understand from working over others, preliminarily, that they have first of all greatly simplified the number of issues. Instead of there being 8 or 10 different liens on different lines of track they have reduced those to 1 or 2. They have very considerably cut down in most cases their fixed charges; that is, the amount of interest charge is less because the rate of interest is lower. They can refund practically for 3½ per cent or even 8½ per cent where formerly they had to pay on those fixed charges 6 or even 7 per cent. But they have not decreased the amount of stock. The amount of stock in many cases has gone on increasing, as in the instance of the Atchison, which I mentioned. The reason for that is in part, as far as I can discover, that persons who are represented by all of those 8 or 10 different securities resting on a given line are not willing to accept in place of their own securities others of a lesser par value than those which they formerly possessed. The result is that many people are satisfied to get a large amount of stock in par value which does not sell for much on the exchange, to have their own old securities rather than get a few shares of something which perhaps will sell higher. There is always a possibility, when you get a large amount of stock that is perhaps worth \$2 or \$3 or \$5 a share, that it may run up toward par; and, of course, the profit will be correspondingly increased. But all of those 8 or 10 classes of security holders, as in the complex case of the Reading, wish to be remembered in the reorganization by a certain amount of stock, which they hope will go up toward par later. All of them being remembered, and being remembered by a large amount in par value, the result is that through the reorganization you have got more stock and bonds than you had before you went into it; whereas the real cause of the receivership and of disaster was that they had too many stocks and bonds in the first place. It is an anomalous condition which is very difficult to meet by legislation, but which I believe can be met in part by enlarging the powers and putting the control over such financial operations into the hands of the Interstate Commerce Commission.

Q. (By Mr. CLARKE.) I would like to ask a question concerning a statement which you made to the effect that the Canadian trunk lines are not subject to the interstate-commerce law. I assume that you are aware of what was reported the Interstate Commerce Commission, on page 63 of its annual report for 1892, to the effect that it was admitted before the commission by the attorneys for the Canadian Pacific and Grand Trunk railways in a hearing at Chicago on the 14th of July, 1892, that those roads are subject to the law to regulate commerce applied to them and their transportation, interstate and international, not only to points in Canada but to all points through Canada in which they are engaged in traffic in every particular. I would like to inquire if you have knowledge of any change in the situation from 1892 to the present time?—A. I believe that your statement is correct. I should, perhaps, modify the statement that I made and place it upon this basis, that the Canadian roads are allowed by the American roads a differential in order, so far as I can discover, not to bring that question to an issue; that is, rather than fight it out they have allowed and do allow in practice the Canadian roads to charge less for a similar haul than the roads allow themselves in United States territory. The impression which I have very strongly is that these roads and their status are different from the situation which is described in 1892. For no other reason can I explain the undoubted desire of the trunk lines to secure some additional tariff which should be imposed, as by the act of 1897 upon traffic which went outside of the United States. I had always supposed that there must be some such information upon it, but it would require a definite examination of the law to determine that point.

Q. Are you aware that the trunk lines in the United States, or at least some of them, made an effort before the Joint High Commission between Great Britain, Canada, and the United States, 2 years ago to get an article in the treaty which it was supposed they would enter into, authorizing the President of the United States to suspend the transit-in-bond privilege in case he became satisfied that the Canadian roads were violating the interstate-commerce law?—A. I was not aware of that fact.

Q. (By Mr. FARQUHAR.) I think there was a statement made here with respect to New England people that there was a discrimination in their cotton and fabric shipments in favor of the South.—A. That is not so; the opposite seems rather to be true. May I give one illustration there? A cotton manufacturer gave me this the other day. It shows in a way one of the burdens which rests upon these

cotton mills in the South in the matter of railroad rates, the southern territory being more nearly pooled than are other parts of the country. The rate on starch, per 100 pounds, from Peoria, Ill., to mills at Chicopee and other New England points was 15 cents. The rate on starch from Peoria, Ill., to cotton mills owned by the same corporation within the southern territory for the same service was 51 cents. He quoted this to me from a bill which had just come in for freight on his starch. In other words, for a distance very considerably greater—I should judge, by the map—15 cents was paid, whereas to the southern territory the rate was 51 cents. That illustration of the rates into the southern territory is indicative, I believe, of the rates which apply out of the southern territory. A certain burden is thus imposed upon the southern manufacturer in that territory for that reason.

Q. (By Mr. CLARKE.) To recur now to the transit-in-bond question, would not the suspension of that privilege be a great damage to the shippers over those roads located in New England and the West and South?—A. Yes.

Q. And would they not be punished even worse than the railroad companies themselves would be?—A. I think so; yes. The continuance of shipment under some just conditions is of very vital importance to the industries of that section of the country.

Q. Therefore inasmuch as the Canadian roads have admitted that they are subject to the interstate-commerce act, and inasmuch as it is certain that the American ends of those through lines are subject to the interstate-commerce act, is it not better that the interstate-commerce act should be enforced, than that there should be any suspension of the privilege of transit in bond?—A. I should say so. I am not familiar with much of the law that would bear upon that point.

Q. (By Mr. A. L. HARRIS.) Is it true or not that the through export rate from this country, say to China, are lower over the Canadian Pacific road than they are over any of our roads?—A. They are not to-day. As I understand it, they should be according to agreement. The Canadian Pacific is allowed by agreement of the American roads to charge a lesser rate than is charged by the other transcontinental lines, but in practice to-day shipments are going to Seattle and San Francisco within the territory of the United States at less than the rate that was to be allowed the Canadian Pacific, by reason of this rate war that has been on in Massachusetts during the last few months.

Q. Taking the inland rate and the ocean rate as a unit, and the point of export being China or any other Pacific point, is there any advantage in shipping over the Canadian Pacific road?—A. I think not. I think a through bill of lading is given in each case. So far as rates are concerned, I think not. In addition to the official, the Southern, the Western, and the special Illinois and Iowa classifications, there is a classification and a special freight tariff published by the transcontinental lines. The rates from one point to another, of course, are determined primarily by competition with water carriage, and the rate is entirely the same, as I have said before, from any point east of the Mississippi River to the Pacific coast. The rate from Chicago to San Francisco is to-day precisely the same—I mean on paper—as the rate from Boston to San Francisco or from any other point east of the Mississippi River.

That is suggestive to my mind as showing how little geography counts in the matter of railroad rates at the present time. The same rate applies over vast expanses of territory with the exception of the Southern States. North of the Ohio and east of the Mississippi you can ship from any city to the Pacific for the same figure. That puts Boston and the other Eastern manufacturing towns that are shipping products to the Orient, of course, on a par with manufactures that are springing up in other parts of the country. The whole subject of import and export rates is a highly important one.

(After a recess the testimony of Mr. Ripley was resumed, as follows:)

THE WITNESS. The whole matter of export and import rates is in an inchoate condition at the present time. The Interstate Commerce Commission has particularly attempted to prevent discrimination on shipments from interior points to foreign countries on the ground that they place our own manufacturers at a disadvantage in competition with foreigners; in other words, that it was not in accord with public policy that the freight rate from Chicago to Liverpool should be less for the entire haul—rail and water—than the rate from Chicago to the local consumer at Boston or some intermediate point. The Interstate Commerce Commission has so adjudged, as I understand it, but the Supreme Court of the United States has, on the other hand, supported the contention of the railroads, especially in the case of the Texas and Pacific Railroad, in which the right of that road to make a rate from New Orleans to San Francisco on goods which had come to New Orleans from Liverpool by water—to make that rate from New Orleans

to San Francisco not more than one-third of the rate which a New Orleans manufacturer would have to pay for the same transportation; in one particular case, for instance, the Texas and Pacific Railway discriminates against the shipper from New Orleans to San Francisco and in favor of the shipper in Liverpool who ships to San Francisco, via New Orleans, by water. The discrimination was from 50 to 200 per cent, as appeared in the testimony in that case. The Supreme Court decided that a railroad was justified in thus discriminating against an American producer, in favor of the one in Liverpool attempting to put down the goods in San Francisco in competition with him, and they did so on this ground, that the rate from New Orleans to San Francisco by land must meet the competitive rate by water, and also that the combined rate from Liverpool to San Francisco—by water to New Orleans, thence by rail on to San Francisco—that that mixed rate must meet the straight water rate from Liverpool to San Francisco; that the minimum figure in either case was determined by the conditions of competition, so that if the Texas and Pacific did not take these goods for one-third of what it charged the domestic producer in New Orleans, that these same goods would not go via New Orleans at all, but would go entirely by water. They said this was not a discrimination against New Orleans. The conditions of competition exist, and it is an advantage to New Orleans that this business goes through that city, which otherwise would go entirely by water. The situation, then, is this: While the Interstate Commerce Commission has attempted to rule out such import and export rates the Supreme Court has upheld them, and the status of the question under the law is consequently mixed. In another case, on books, buttons, carpets, hosiery, etc., the domestic rate from New Orleans to San Francisco was \$2.88 per hundredweight, while the total rate on imported goods from Liverpool was \$1.07, and the Texas and Pacific got only its proportional amount of that \$1.07; the result being that while the New Orleans producer was paying \$2.88 for his transportation, the Liverpool producer was getting the same number of miles haul for a fraction of \$1.07.

That is a question which should, it seems to me, be investigated quite thoroughly respecting the various phases of it as they occur in this country. One I have already suggested; the haul across country from New Orleans is very important; another is the transport of cotton goods from New England manufacturers to the Orient, they then being carried by water from Vancouver, Seattle, or San Francisco. The existence of these low export rates to the Pacific is absolutely essential to the manufacturers in order to keep them on a par with manufacturers who can send the entire way by water. Unless the Pacific lines, therefore, are to carry these cotton goods for a figure which will be less than they would charge for carrying the same cotton goods for consumption in California or Colorado, the goods will not go that way. They will either go entirely by water, or the market of the New England manufacturer will be restricted. That is another phase of the same question.

Turning it the other way round, we have to consider the export rates and southern California fruits which are destined for Europe. Whether the consumer in the eastern part of the United States shall pay more for the haul entirely on land within the United States—far more than shall be charged for goods which are to be consumed in Europe and which are to be hauled three or four times the distance—is the question. The existence of a great many industries depends on their continuance under certain regulations. As I say, the law is very mixed at present. The continuance of that system is a problem not peculiar to the United States. They have the same thing in England. Here is an extreme case which was brought out in part of the testimony before the Interstate Commerce Commission: Tin plate was carried from Swansea to Liverpool, thence to New York and to Chicago, via Pittsburg, at a total charge less than the published rate from Pittsburg to Chicago; that is to say, the producer of tin plate in Pittsburg, attempting to sell his product in Chicago, was paying more for that haul of a few hundred miles than did the producers of tin plate abroad. I believe that here is a serious question involving the rights of the consumer in this country and of the producer, upon which testimony might be collected which would have a very definite value.

Q. (By Mr. CLARKE.) Have you studied that problem in connection with the same business, in the application of the principles of a protective tariff to it also?—
A. I have not. I can see that in many cases the existence of these import rates may nullify or render of far less value certain protective duties which may be in force. It would wear them out altogether. But it is a highly complicated question which I think should be investigated from the point of view of facts collected in the field.

Q. (By Mr. PHILLIPS.) Have you any facts in regard to farm products being

shipped from the West through to Liverpool?—A. I have not any further than this, that I think it can be established that these products will not go through to Liverpool without a special concession in rates; or rather that the trunk lines can not live if they give to all their traffic as low a rate of freight as they have to be contented with on traffic going abroad. The distinction between import and export rates is clear. The import rate concerns the producer in this country; the export rate bears a little differently, because it concerns the railroad; that is to say, the railroad can not live on the few cents per bushel or per hundredweight on all its traffic with which it must be contented on its export traffic alone. The road could not live if it got no more than that on its traffic. It is one of the most complicated questions in the whole domain of rates, and I think a comparison of the conditions in our field with those that have had to be met under the laws of England and other countries would be highly suggestive.

The question of import and export rates also becomes important as bearing upon the matter of personal discrimination. The Eastern Trunk Line Association in April of this year was obliged to make a ruling (and there was a great deal of opposition to it) respecting the character of goods which were coming for export. We will say a shipper from Chicago or Milwaukee, or some other Western point of shipment, sent a package of goods on an export through bill, and consequently at a low rate, but included in that package a number of goods destined for local delivery in New York. Then when they went through the hands of the shipping agents in New York they removed from the package that part intended for local delivery, thereby getting the advantage of the low export rates on goods intended for local traffic, making a very considerable profit in that way. The ruling of the Trunk Line Association, if I remember rightly, was that whenever the package contained goods destined for abroad and charged consequently a low export through rate, that package should be charged less than carload rates; that if it contained any goods destined for local shipment, that should vitiate the contract and that higher local rates should be paid on the entire package.

Q. (By Mr. FARQUHAR.) How could you emasculate the through bill of lading by subtracting a part of the goods in New York?—A. I think they were content to pay the entire through rate on the whole package of goods; it was cheaper to pay on the whole package of goods through to Liverpool than to pay the local freight rates on a portion to New York.

Q. Would they have to rewrite the through bill of lading?—A. I have from the New York Journal of Commerce a statement about that, which may perhaps cover that particular point. The exact rule adopted by the Trunk Line Association freight committee provides that when any local goods are shipped in the car with export freight, less than carload rates must be charged.

There is another phase of investigation, of which I know very little, but which I think has an important bearing on the distribution of industries, and that is the effect of the basing-point system in the Southern States. I have tried to get information about that from several sources, but find it difficult. It is essentially different from the condition that prevails in the traffic north of the Ohio. I understand the influence of it is still more strongly felt than in the North, to concentrate industrial activity at particular places. I refer to the way in which they build up all the rates from certain basing points.

Q. (By Mr. CLARKE.) Do you understand the matter of basing points is peculiar to the Southern States?—A. I suppose it is developed further there than elsewhere. I can illustrate that to you by a diagram which is published by the chief inspector of the joint rate and inspection bureau of the Trunk Line Association at Chicago. This map is published by the railroads for the use of their agents and shows the distribution of the percentage rates on the Chicago and New York basis, which is the nearest approach in the North to the Southern basing-point system: that is to say, the distance from Chicago to New York is always taken as 100. [Here the witness used the map as he proceeded with his testimony.] In parts of this territory shipments from any point within it are 96 per cent of the Chicago-New York rate, whatever that may be. The rate may be modified by agreement between the railroads. It may be 75 cents on a certain class, or fall to 60 cents, or go up to 80 cents, but whatever it is, it is 96 per cent of that rate in this section of the territory. Within other parts of the territory it is 95 per cent of that Chicago-New York rate—65 or 80 or 110 per cent, or whatever it might be.

Q. How long has that system been in vogue?—A. I think for a great many years; I can not state directly, but it is the basis of the entire east-bound shipment at the present time. This is within Central Traffic Association territory; further to the east the rates are regulated by the Eastern Trunk Line Association. It shows more clearly than anything else, I think, the way in which competition upsets geography. Rates do not conform to distances at all; while roughly corresponding to them, they do not follow directly a distance basis.

The Canadian territory, you will see, is divided in the same way, with the various shipping rates. To my mind that would come out very much more clearly if 60 per cent, for instance, were white on the map and it gradually came down in shade until you ran up to 123 per cent, as you see in the northwest sections of this country, in which the absence of competitive conditions bears heavily on industrial development.

Q. (By Mr. TOMPKINS.) I have heard the statement made that English ships are giving lower rates to New York and to Shanghai than from Liverpool to Shanghai. Do you know anything about that?—A. I know nothing about it. I should be glad to know. The question of ocean freights is one upon which it is exceedingly difficult to get evidence; lying entirely without the territorial jurisdiction of the several countries, material is far more difficult to obtain than it is in the matter of railroads; but of course it is and should be an essential part of any investigation of import and export rates.

The next topic which I had marked in your topical plan was that of classification of freight. The Interstate Commerce Commission and the various conventions of the State railroad commissioners from all over the country have attempted and are still seeking to devise a uniform classification of freight for the entire United States. At present there are in the neighborhood of five such classifications, the principal one of which, known as the Official Classification, covers the territory east of the Mississippi—that of the Eastern Trunk Line Association; another covers the far Western States and is known as the Western Classification; another covers the territory south of the Ohio and is known as the Southern Classification; and then several of the States, Illinois and Iowa, I believe, prescribe by law what the classification of freight on their railroads shall be.

I have already spoken of and tried to emphasize the fact that classification means high or low rates. That is to say, you may have a reduction of rates on a railroad, but if boots and shoes, which formerly went second class, are by the new classification moved up into first class, the reduction of the general schedule may be offset or more than met by that device; and a great many classifications have been changed since the enactment of the Interstate Commerce Law—probably 21; the twenty-first of these classifications in the eastern territory has just been published within a week.

Absence of uniform classification occasions very great difficulty when a man wishes to ship a certain class of goods from New York over into Nebraska, owing to the fact that his commodity may be first class under the official classification of the lines east of the Mississippi, and from that point on those same goods in the other classification of the Western States may be rated second class. It occasions difficulty in the assessment of charges, and it makes it exceedingly difficult to compare the movement of rates to-day with those that prevailed a year or 2 years or 10 years ago. It is almost impossible to trace the movement of rates which extend across lines of division between different classification territories.

The result of all this is, as I said in the beginning, that the Interstate Commerce Commission and the annual conventions of State railroad commissioners have sought to prevail upon the railroads to devise themselves a universal classification which shall apply all over the country, so that oranges shall be first-class freight in New England and first-class freight in California; so that cotton goods shall be first class from one end of the country to the other; so that all those articles which do not go at commodity rates shall be similarly classified within the entire territory of the United States.

The difficulty in the way of so doing is very considerable, although the advantage would undoubtedly be great; and the difficulty, as I understand it, is that a commodity in one part of the country is the ordinary product of the soil, while it becomes at a distant point from production perhaps a luxury, and that consequently the railroads, in charging as they do at the present time what the traffic will bear, must charge at a low classification in the country of production, but when you get into the country where it becomes a luxury they might otherwise charge more without killing the business. In other words, to illustrate, oranges in California are the product of the soil—the common product of a local industry—and to put oranges first class in California is to levy an excessive burden upon that community. Oranges are worth comparatively little by the box in that place, but transport those oranges to the northeastern corner of the United States and they become worth so much a dozen. This increase in value makes it possible to move them up in the scale of classification and to charge correspondingly more. Suppose they were to apply a uniform classification and make oranges first class throughout the entire United States, the result would be that the first-class rates on the California roads, which are very high, would be such as to simply smother the industry. Suppose, on the other hand, that they sought to put oranges in the

fourth class; the result would be that oranges, which are expensive to handle and which require quick shipment through the New England territory, would be yielding a great deal less to the railroads than other traffic of a similarly valuable kind.

An illustration has come to me equally suggestive as bearing on manufactures, as follows: Through the Indiana, Ohio, and Illinois industrial territory agricultural implements are manufactured and shipped west in considerable numbers. Wood enters as an important element into the cost of production of these goods. They are the product (as were the oranges in California) of local industry, and it is to the interest of the railroad and absolutely essential to the prosperity of that section that those commodities should go at as low a rate as will yield a small profit to the railroad. But transport those same agricultural implements to California, where they have no wood and where the implements are needed for the development of the country, and charging what the traffic will bear will make it possible to classify these same implements not in third class, but perhaps first class. If the roads in California refuse to agree with those in Indiana, Illinois, and Ohio in accepting first-class rates on oranges, they would cut off the kind of traffic from which the Eastern roads make a great deal of profit; but, on the other hand, for the roads in Indiana, Illinois, and Ohio to refuse to accept a low classification on agricultural implements would similarly cut off from the Western roads a kind of traffic which is most profitable to them.

There should be, it seems to me, a sort of reciprocal interest here. Freight is going from the East to the West which is a product of the country in the East and which becomes a luxury in the West. Many products in the West are very cheap there, but when they come to the East they are so valuable they will bear higher classification rates. The whole question of uniform classification involves an agreement between all these railroads and a recognition of the fact that what one road loses on certain kinds of traffic it will gain on others at either end of the line. Whether there will be such a gain on the one hand as to offset loss on the other will depend on the character of the product. The attempt so far to bring the roads together has been unavailing, although great progress has been made. One of the greatest services of the interstate-commerce act has been that it has been influential to some degree in removing the great number of arbitrary classifications which were formerly in force. In 1883 on the Wabash road they had 9 different classifications in force on the line of that road. They had the classification of the Middle and Eastern States, which divided freight into 6 classes; they had the classification of the Southern Railway and Steamship Association, with 18 classes; they had the classification of the Mississippi Valley, with 5 classes, and so on. The result was that if you wanted to know how much a certain kind of service was going to cost, it took an interminable calculation, not at all unlike the calculations when they had the old State-bank notes and you had to carry a list in your pockets to show what each of the particular banks was good for. It was impossible to figure out what the rates would be in advance, and the shipper was at the mercy of the railroad. They charged what they pleased and gave him a statement that his shipment went through certain classification territories and that the rate was so and so much. Those highly complex conditions have been replaced by the comparatively simple situation to-day of 5 or 6 principal classifications, and it seems not unlikely that the ultimate result may be the acceptance by all the roads of a uniform schedule.

The next topic marked was "Consideration of advisability of prohibiting by law the increase of stock by interstate railways without a governmental permit therefor." I have already spoken of this this morning. I believe that it would be a modification of the law which would be of very great advantage in that it would give the commission a certain control over the roads, they having something which the roads wanted and which the commission alone could give. Whether such an amendment is possible under present conditions remains to be seen; but if it could be done as it is in Massachusetts it might go far to supply the present inability of the commission to prescribe what rates are reasonable and what are not. It would strengthen their hands very largely and would eradicate some of the unstable practices of stockjobbing at the present time. Although some phases of stock watering are not altogether bad and certain phases of it seem to be essential to the legitimate development of the property, what is legitimate and what is not depends upon the value of the property, the cost of duplicating it, and its earnings, in relation to the par value of the issues already out.

A very highly complicated question, and one in which I would suggest that your commission might gather material which should have value, would be a study of the movement of capitalization in, we will say, the last 10 years; the determination of the amount of such capitalization, which consisted of stocks as distinct from fixed charges, such as bonds.

A great many of our roads in this country are reducing their bond issues and substituting stock, for the reason that an issue of stock is a burden which may be laid down in time of depression; that is, dividends are not necessarily paid on stock. On the other hand bond charges must be met regularly or else there is bankruptcy or receivership. The difficulty in such substitution is that it is only an exceedingly strong road that can issue stock. The Eastern trunk lines can issue stock at a very considerable figure above par if they choose to do so. Of course, ordinarily, in any State outside of Massachusetts, such stock is issued to the stockholders at a bonus and the profit to the owners consists in the difference between the market value of the stock and the par values at which it is issued.

Another point in the investigation of capitalization worth consideration is the degree to which many of our large railroads are owned in this country or abroad. That is a matter of great public interest. An investigation has recently been made and published in the Yale Review. The information in the main has been gathered from foreign bankers to determine what railroads in this country are predominately owned in Europe and what are not. The financing of a railroad in Europe is almost always different from the financing of a railroad in this country. The English investors will buy bonds when they will not buy stock. The English traditions make the ownership of bonds seem more secure than stock; and in the roads like the Erie and Pennsylvania, in which foreign ownership is comparatively high—the Erie particularly, the influence of foreign traditions in the way of financing make themselves clearly apparent.

The degree to which the railroads are putting earnings back into the property or paying them out in dividends could also, I believe, be determined by a careful investigation. Some of the roads at the present time—for instance the New York Central—are paying a low rate of dividends because they are turning a large amount of surplus earnings back into the property in straightening curves, putting in new stations, and especially in developing terminals. Many of the other roads pay out money as fast as earned and those dividends show exactly what burden is resting on the public.

Q. (By Mr. FARQUHAR.) Do you think you could find out what the American railroads realized from bonds that were sold in Europe?—A. You mean at what discount or premium?

Q. Yes; is there any means of finding that out?—A. There is one means always open to an investigation of this question, and that is the testimony to be had of the dissenting stockholders or bondholders in any proposition. Whenever any financial operation is carried on there is nearly always some stock or bond holder who is willing to report—who would, perhaps, for instance, be willing to testify before your body.

Q. In any investigation you might make of this so-called stock watering would it not be a very good thing to find out whether bonds were sold for 60 and 62 and 65, and whether those bonds have paid interest since that time, and whether it has been a permanent debt on the road and bonds have to be issued by that road in the future to cover the difference between par and the selling price in Europe?—A. Precisely.

Q. Is not that fair? You would not call that stock watering?—A. That would not be technically stock watering, but it has the same effect; it increases the amount of securities outstanding.

Q. But legitimate as a matter of accounting?—A. I should say so. To cite another instance, take the Chicago and Alton road which, as I mentioned this morning, in the opinion of many men whose judgment is worth having, has been as flagrantly watered in the last two years as any road in our country. Its volume of securities has increased from about \$42,000,000, I believe, to something like \$120,000,000, an appreciable part of that increase going as profits to the persons who carried through the deal. A large part of these bonds were sold, as I have been told, as low as 65, and they were then resold in Europe as high as 95, the difference of 30 going to the persons who carried through the deal.

I think a most suggestive line of inquiry would be to describe a half dozen of these recent examples of manipulation which have borne very hard on the investor, and which can not but have a profound result upon the public, if those roads are to earn any return on that capital. A detailed investigation of certain of these, with such information as could be obtained from the railroad and financial journals of established standing, and, in addition, from such testimony as might be obtained from witnesses—such a detailed investigation would have definite value in pointing a way to the reform of our laws along the Massachusetts line.

One more topic I have to speak upon, that of taxation, and here I can only refer you to the attempt in Michigan under the present law to tax the franchises of all its public-service corporations—one of the most interesting and suggestive experi-

ments that has come to my notice for a long time. I spent a day, about 2 weeks ago, in the tax commissioner's office, and went over rather carefully the means which they have adopted there for taxing the franchises of those public-service corporations. The law makes an attempt to distinguish between the tangible physical property in rails, in graded right of way, in bridges, in stations, and the non-physical property of that corporation, which consists in its right to be and to do business. They have attempted—and it seems to me that it is being done in a most thorough fashion—to determine how much it would cost this year to reproduce every kind of a public-service corporation now in the State of Michigan—the railroads and the street railroads, the gas and water companies, the plank roads, the dams and locks, and electric-lighting corporations, and others of that sort. In other words, they consider for the moment the State of Michigan covered with virgin forests, and they ask how much it would cost to-day to put all these properties into place and into operation as they stand. A large number of engineers are traversing the State from end to end, literally counting the rivets in the bridges, etc. For one of the railroads, showing you into what detail they go, they report as to the number of rails, the kind of track fasteners and frogs, switches and crossings, the kind of tools, the cost of loading transportation and unloading the fixtures, etc. In other words, How much is that entire railroad worth to-day solely as tangible physical property? Then they ask—and this concerns the nonphysical element—How much is that road earning to-day; how much has it earned on an average for the last 10 years, and what is a fair capitalization of those earnings? After which they endeavor to determine the difference between the tangible physical property, which is taxed under the general property laws in Michigan, and this vastly larger sum which is the capitalization of the earnings which that road is making. The difference between those two is what they call the franchise, which, under the law, is subject to special taxation.

A doubly interesting problem is presented; first, the arithmetical means by which they attempt to determine the franchise value, and second, that as an indirect result of this they are going to know just how much all that property is worth. It is, in fact, a census of the public-service property in the State of Michigan. If it were under our Massachusetts laws, and they were strictly construed, the capitalization of all those public-service corporations would exactly equal the value of the tangible physical plant. We have no such a thing in Boston in the theory of the law as a franchise value. It does not apply to the corporations in Boston, and but to a few of those which are so large as to be exempt by law, but in the case of all the others the actual property is supposed to equal the capitalization.

Q. (By Mr. CLARKE.) When was this Michigan law enacted under which this inquiry and appraisal is being made?—A. I believe it was in 1890, although it may have been the latter part of 1898.

Q. A new law?—A. It has this objection, and I think a proper one, that it is unfair to expect every railroad in Michigan to bring down its capitalization to what it would cost to build that railroad to-day. When those railroads were built all the expenses of construction were greater, all the conditions, risk, and everything else under which those roads were built were such that probably it cost them half as much again as it would to-day. The mere fall of prices since 1873 will illustrate that point.

Q. This ascertainment of value is for the purpose of taxation only, is it not?—A. It is for the purpose of taxation.

Q. Then, of course, if it shows a lower valuation to-day than the cost was when the property was constructed, the railroads will hardly be the parties to find fault with that?—A. I have anticipated that most interesting results in that connection between the original cost—original investment—and present duplication value will come out. I think that a discussion of that question—the rights of the original investor as against the right of the present corporation which holds the property—should form a definite element in any discussion of the proper basis of capitalization to-day.

Q. Have you studied the increase in value with reference to the Illinois Central road system in particular?—A. No; not in particular.

Q. I have heard that that affords one of the best illustrations of that subject that there is in the country, and I think when you do give special consideration to the question you had better look into that road.—A. I would suggest, if any analysis were made in this way, that instead of attempting to deal with the whole United States the situation be carefully looked over and enough roads of each type be picked out, so that it would not look like a strike at a particular corporation. Having chosen enough roads of each particular class, these should be analyzed in detail. A detailed analysis of financial matters is always necessary; you can not generalize without being exceedingly careful that your basis is cor-

rect. Such a study of the relation of prime cost to present cost of duplication, and then again the value of the property after it has depreciated, should all be included in any study of capitalization. May I illustrate what I mean there? They compute the cost of duplication of each railroad in Michigan and work it out in detail; then they ask, How much is that railroad worth for scrap? And they distinguish each particular class of property thus segregated. One set of engineers estimates the cost of that number of miles of steel rails, how much are those rails worth as scrap, and how long is their normal life. If the rail's life is normal, and if it is good for 25 years, the assumption is made that one twenty-fifth of the difference between the cost of new rails and scrap disappears in each year. Then, if the road has been built 3 years, three twenty-fifths of this difference in value should rightly be deducted in order to determine how much that road is worth for use at the present time. In other words, the distinction is made for one of the first times in the law of our States between maintenance and depreciation.

Q. (By Mr. LITCHMAN.) Is there any elimination of stock?—A. This particular investigation is not directed to the question of stock issues, but that may come as a possible result afterwards.

Q. Is it not true that the capitalization covers not only the first cost, but all improvements in some roads?—A. It does in some roads. In others it varies, as in the instance of roads which, like the old Chicago and Alton, had been so conservatively financed that the capitalization represented only 60 per cent of the value of the property. A responsible financial journal states that 2 years ago the amount of stock and bonds issued by this road represented only about 60 per cent of the tangible physical value of that road. That is under-capitalization.

Q. The capital stock remains a permanent burden upon the public, does it not, assuming that there is a dividend on the stock?—A. It does.

Q. Then a continual addition of stock for expenses that ought to be charged to construction tends to increase that burden?—A. It does.

Q. Tends to make the amount to be earned to pay dividends on the stock larger, and consequently the burden on the public larger?—A. It does.

Q. What do you think of the advisability of some plan whereby a system of sinking fund should be compelled to eliminate that cost, and eventually reduce the burden on the public by reducing the amount of the capital stock?—A. That is already done by conservatively financed roads, except that they do it by other means than sinking funds. They do it by putting a larger and increasing proportion of their earnings back into the property instead of paying it out as dividends.

Q. In other words, they charge it to operating and do not issue new stock?—A. Yes; they charge it to operating expenses. A study of the policy of the conservative roads—by conservative I mean in this respect solely as compared with the roads which have been unwisely financed—would be of great value in determining what the proper policy of any laws should be in control.

Q. (By Mr. PHILLIPS.) What would be your view in regard to requiring the roads to set aside a sinking fund to liquidate their bonds?—A. The only difficulty that suggests itself to my mind would be that the status of those sinking funds would be highly complicated if the roads went into the hands of a receiver before the final burden of securities were paid off. For instance, suppose we have 10 years from now another period of depression, and railroad earnings decrease so that a good many of the roads which are now heavily charged with bonded and stock securities go into the hands of receivers. If those roads were carrying a very considerable sinking fund, the legal position of that property, so vested in a sinking fund, might lead to legal complications. I am not enough of a lawyer to state exactly what would be the case; but before any proposition for the regulation of capitalization can ever be wisely made, it seems to me that the relation between these several elements of prime cost, cost of duplication or depreciation, etc., should be investigated in the fullest manner and properly correlated.

(Testimony closed.)

WASHINGTON, D. C., January 14, 1901.

TESTIMONY OF MR. HENRY C. BARTER,

Secretary-Treasurer International Longshoremen's Association.

The commission met at 10.49 a. m., Mr. Phillips presiding. At that time Mr. Henry C. Barter, secretary-treasurer International Longshoremen's Association, Detroit, Mich., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will please give your name and address and official position in your organization.—A. Henry C. Barter, secretary-treasurer of the International Longshoremen's Association; office address, 530 East Atwater street, Detroit, Mich.

Q. How long has your organization, as an international organization been in existence?—A. It was organized in the year 1892, in the city of Detroit, Mich. That was the starting of the organization. It was then not known as "international;" it was known as the national, but that is practically the same organization. In 1893 it was changed to an international organization.

Q. At that time was it made up from locals?—A. At the beginning, in 1892, it was made up of locals of lumber handlers only; but in 1893 it changed the name of the organization to International Longshoremen's Association and included every dock worker on the chain of lakes, Atlantic and Pacific coasts and rivers, and the ports of Canada. I mean all ports of the United States and Canada—coast, lake, and river.

Q. About what is your membership now?—A. Well, a conservative estimate would be 40,000; that means the lakes, Atlantic, Pacific, the Gulf, Canada, and Costa Rica. There may be more than that, but I am giving a conservative estimate.

Q. How frequently do you have your international convention?—A. Yearly, in July.

Q. Are these delegate conventions from your locals?—A. Yes. Each local organization is entitled to 2 delegates, and they vote according to the membership.

Q. What are your annual dues?—A. Our annual dues—the tax, as we call it—from locals to international, you mean?

Q. Yes.—A. Five cents per month.

Q. Your local dues, then, are different in different sections of the country, are they?—A. Yes; they regulate themselves. Generally about 50 cents per month is what the members pay to local organizations for their local funds. The tax of 5 cents per member is paid to the international.

Q. Is that 50 cents per month collected during the 12 months of the year?—A. No. On most of the ports of the lakes 10 months, some 8 months, some 9 and some 10, and a few 12 months, where they have sick and death benefits.

Q. How many of your locals have sick and death benefits proportionately to the whole?—A. About 20 per cent.

Q. Could you at the present time give any idea of these benefits and what they amount to?—A. Yes. I will take one particular organization—that of Ashland, Wis. They pay \$5 a week sick benefit, and at death \$100, and they hire a band, and the members turn out in a body. They also have a large burial lot in both cemeteries, Catholic and Protestant, where members are buried; that is, if the family chooses. If a man has been disabled, and \$5 a week is not enough, they invariably give him more, generally to meet conditions—where it is necessary, possibly, to be in a hospital, if he has not a family, and it is necessary, probably, to give him a little more to keep him decently.

Q. Have you any insurance features in your organization?—A. No; the international has no beneficial features; that is, in regard to sick benefit or accident insurance.

Q. The 5 cents is for what—the expense of the international organization?—A. Meeting expenses in the international organization, paying salaries, and paying expenses of attending conferences and conventions. We probably attend more conventions than any other organization in the country. We meet several times a year with our employers.

Q. Have you any arrangement for a defense or strike fund?—A. No.

Q. (By Mr. LITCHMAN.) Are your beneficial features there established by rules of the international organization or left with each local to make their own arrangement?—A. Left to each local organization. Each local organization affiliated with our international is guaranteed its own local autonomy.

Q. How do you do in the case of strikes? Do you make assessments on a local, or do you make assessments of the others to help the local out?—A. We have not made any assessments since the organization was formed. One thing we are blessed with—we don't have many strikes, and our strikes are not of long duration. In one case only has an organization been compelled to be assisted financially during a strike; only one case since 1892.

Q. What case was that?—A. That was the Buffalo freight handlers.

Q. Did you have more than one organization in Buffalo at that time?—A. Yes; we had several. That was last spring when we were appealed to. In the strike of 1899 no appeal was made for funds.

Q. Did you immediately handle that strike of 1899—your organization?—A.

No; I can't say that we immediately handled it. We went there after the strike had reached a position where it was necessary to bring about a conciliation. Mr. Keefe was our representative in that trouble, and it was settled satisfactorily through the efforts of Mr. Keefe and also some other good citizens in Buffalo.

Q. Was Mr. Keefe a member of that as well as the local and Lake Carriers' Association?—A. Yes.

Q. Have you had any trouble in Buffalo since?—A. We had trouble there last spring.

Q. What did that arise from?—A. That was from the package freight handlers. They were desirous of wiping out the contract system under Messrs. Conners and Kennedy's dictation.

Q. Could you state the reasons of the strike in Buffalo in 1899?—A. The strike in 1899 was for this reason: Prior to the spring of 1899 the contract for handling the grain at the port of Buffalo was handled by Mr. Kennedy. In the winter, or in the month of January, 1899, Mr. Conners secured the contract. Mr. Conners attempted to introduce a new system. Prior to the spring of 1899 Mr. Kennedy, the old contractor, gave the men an equal division of a certain sum—a certain sum was paid the men—and that was supposed to be equally divided among the men who worked upon these boats. When Mr. Conners secured the contract, in 1899, he attempted to introduce a new system; that was to pay the men by the hour instead of by the thousand, and he offered to pay the men 25 and 30 cents per hour. The men then struck and demanded the abolishment of the contract system entirely. The men were opposed to the contract system for many reasons. It was universal over the lakes prior to that time, and that was the reason of the formation of our organization. Most of the stevedores—that is what we call the contractors on the lakes—most of the stevedores controlled or operated saloons. The men were supposed to patronize the saloons owned and controlled by the stevedores, and the men who patronized them best were retained and given permanent employment; but as our organization took hold it aimed to bring about the abolishment of this obnoxious condition, and this was one of the evils that the men had to contend with at the port of Buffalo. I had to visit Buffalo on many occasions, and visited there in the spring of 1899, and the men complained of this obnoxious saloon system. They claimed that unless they patronized the saloons they were not given work, and that they were expected to spend a good deal of their money there. They fought for the abolishment of the system entirely, and put up a very good, fair fight, with no attempt at violence. There was some violence committed, but not by the members of our organization. If I remember rightly, there was not one of our men arrested for any attempt at violence. The clergy there and priests took hold of the matter, and ex-Congressman Roland B. Mahany, and under their direction, and that of Mr. Keefe—Mr. Keefe was of valuable assistance there—they advised the men to keep away from the docks, keep sober, and obey the police, and several conferences were held between the representatives of the Lake Carriers' Association and the representatives of our organization, and also Father Cronin and Bishop Quigley, for the purpose of trying to bring about a settlement. The lake carriers, through their executive committee and their counsel, Mr. Harvey Goulder, made propositions to our representatives that the lake carriers would be parties to the contract, guaranteeing the men an equal division of the amount paid to them. They even agreed to pay 5 cents more than the men had received the season previous, if I remember rightly. In other words, the lake carriers would practically become a party to the agreement between the men and Mr. Conners; that is, they would see that it was carried out to the very letter. The men hung out longer, demanding the abolishment of the contract system, and demanding that the contract be let to them.

Q. Immediately to the local through the officers?—A. Immediately to the locals and their officers; but the carriers objected, and finally an agreement was entered into whereby the organization practically got the contract. The men got nearly all they contended for, with the single exception of getting the contract direct from the carriers.

Q. Was your trouble the fact that the Lake Carriers' Association could not break the contract?—A. No; they could not break the contract, but the men practically had the contract, and Mr. Conners had to treat as a factor. All he received was 5 cents on a thousand for his work, when prior to that Mr. Kennedy had received 5 cents for the running of the contract, and the paying of the men, clerical hire, office rent, etc. But the agitation was kept up, and last winter our organization, through our international, was successful in gaining the contract.

Q. At or about the time of the strike of 1899 in Buffalo, did Mr. Conners and others have contracts in other lake ports?—A. Yes; I was given to understand that Mr. Conners had contracts in Milwaukee, Chicago, and Gladstone, Mich.

Q. Did his contracts continue after that time, or did your locals get them after the settlement of the Buffalo strike?—A. Well, after the Buffalo strike our organization in Gladstone handled the contract.

Q. How is it in Milwaukee and Chicago?—A. In Milwaukee and Chicago Mr. Conners still operates to a certain extent. He has not all the docks. There is competition in the stevedore system in Milwaukee and Chicago to-day.

Q. Does Conners recognize your local unions in those cities?—A. We have not asked him to do so.

Q. Is there much difference in the scale that he pays and what the locals receive?—A. In Chicago and Milwaukee?

Q. Yes.—A. We have no organization of freight handlers in Chicago. We have an organization in Milwaukee, and I am given to understand that he pays the same wages as demanded by the organization in Milwaukee.

Q. Do you know how long the Conners contracts continue; are they annual, or longer?—A. I understand they are let annually.

Q. Has the Lake Carriers' Association anything to do with the letting of these contracts?—A. No.

Q. Wherein does the Lake Carriers' Association have any right or interference in respect to the making of the contracts on the lakes; what points?—A. Well, the lake carriers' organization is organized mainly for legislative purposes. They have never taken up any particular contract, or taken up the question of issuing any particular contract, with the single exception of the Buffalo contract; that is, prior to the spring of 1898; but since that time we do business with members of the Lake Carriers' Union as dock managers, which is practically the lake carriers. But the organization of lake carriers, as a body, does not make any contracts for the letting or handling of boats, with the single exception of the Buffalo strike.

Q. That is, the lake carriers' organization—it is not part of their constitution to interfere with these contracts, and be a party to the making of the contracts?—A. That is right; that is purely a legislative body.

Q. In the Buffalo matter was the saloon system the main point of difference?—A. Yes; the saloon system was the main question.

Q. Has that been abolished entirely?—A. That is abolished entirely.

Q. Is your local the party for the arrangements in Buffalo, for making the scale?—A. No; the international is the main factor. The local is a party to the contract. The international organization is looked upon as the main factor, but of course the organization at Buffalo is certainly a factor too. Our international organization—that is its business to secure these contracts, and they always sign as the international, as representatives of the international organization; and the locals, too, are parties to the contract.

Q. The president of your local union is one party to see that this is carried out; who is the other party?—A. The officers of the international organization.

Q. And who is the other contracting party?—A. Whoever we do business with—sometimes the local carriers, sometimes the dock managers. Sometimes we do business with different roads in regard to package freight—that is, the superintendent of the freight docks.

Q. What classes of handling are comprised in your international organization?—A. Lumber loaders and unloaders. Those are the men that load boats and unload them; also the coal shovelers and trimmers, unloaders, and loaders. Then there are the ore shovelers, and trimmers, loaders, and unloaders in general, and package-freight handlers, unloaders, and loaders; warehouse package-freight handlers; loaders and unloaders of salt, grain; trimmers and scoopers, dock hoisters, and engineers, millmen, and all men employed in lumber yards; dock firemen and marine firemen, and all other men that are engaged in working along and around docks on the Great Lakes, the coast, and rivers.

Q. You have now a system of agreements, have you, in these various ports that the international enters into with the owners of floating property?—A. Yes.

Q. Would you say that in all of the ports of the lakes you have agreements with these parties as to loading and unloading?—A. No; I would not say we have agreements in all ports. We have practically, however, an understanding with our different interests for the loading and unloading of the boats in nearly every port on the Great Lakes.

Q. Under the old system of individuals, like Conners, making contracts, the profits all went to the contracting parties?—A. Yes.

Q. How do you manage now in making your contracts; does your local union make the rates and the union itself gain the advantage of profits?—A. The international has been the first party to the securing of agreements, and the locals are the parties, of course, interested and involved, and in taking these contracts every

member secures an equal division of the profits. Now, in some ports we work in gangs; in fact, we all work in gangs in all ports, but in certain ports we work in gangs, and each gang takes its turn. Now, we will say, to illustrate it, that one port has two gangs. On the arrival of the first boat in the spring of the year No. 1 gang goes to work, and when that boat is unloaded in some instances they get paid directly the boat is unloaded. The foreman and two of the gang collect the money. They see the bills of lading, and they figure it out and know what is coming to them. They then go to their hall or office, whichever they have, and that money is equally divided among the men employed on that boat. When the second boat comes in, No. 2 gang goes to work, and so they work continuously all summer. The men, however, do the work and receive all the profits.

Q. In your working season, about what average weekly wage will the scooper make?—A. That would be pretty hard to arrive at.

Q. Have you any table that would show the average of wages on the different classes of work?—A. No. I can tell you what they have done. If I had some time, 2 or 3 months, I could give what they have made for the season—what they have averaged. The average wage for grain scoopers is 60 cents per hour when employed.

Q. You could not average the period of employment, could you?—A. Not over 6 months. We have different systems, too; the grain scooper and the grain trimmer. The grain trimmer is a little different from the scooper. The scooper unloads the boat; the trimmer is the one that attends to the loading. The trimmers make a little more than the scoopers. The scooper will make 60 cents per hour. They work all hours in a day. The men in Buffalo are distributed among the different elevators. From a certain hour on Saturday night until a certain hour on Sunday night, the men receive time and a half; that is, they make 90 cents per hour week days, and they make 90 cents per hour on Saturday night and Sunday. The grain trimmer has a little more dusty work than the scooper. Of course you know the men do not stand this work long; they do not live to be old men. Scooping or trimming, especially in barley, kills a man off pretty lively. The trimmer may average a little more than 60 cents while around the boat. Of course in the scooping and trimming, directly the leg of the elevator is put in the boat the men don't start to work, but I am taking the average from the time that the leg is put in the boat until they are finished. Now in scooping the leg is there and the elevator is there. They don't get in the boat until it has gone down, possibly half of it; and the same way in trimming, they don't get into the boat until the boat is about half unloaded, but the average there is for the time the leg goes in until the leg is taken off.

Q. Since your organization has had a foothold on these ports of the lakes have wages of this class advanced or are they stationary?—A. Oh, yes; advanced materially, especially during the last 3 years. In the old days men did not know what they were getting—under the old stevedore system. Ten years ago or 15 years ago it was worse yet. A good many of the men were hired for their being pretty good, stout, husky fellows, so that in case of necessity they could fight for the stevedore. In those old days competition was in vogue, and the stevedore backed by a good strapping band of fighters could necessarily drive the stevedore with the weaker ones away, and so that continued until that stevedore had practically a monopoly of the work, and then when he was successful, he would charge all kinds of fancy prices for loading and unloading. But while the competition existed, the stevedores would cut prices with one another, and sometimes would do the work quite reasonably, but the men were made to suffer for it. In the old days there were bunks in the saloon, or in a barn or shed which was adjacent to the saloon, and the men lived there in the summer season, stayed there, and most of their pay was bad whisky. Since our organization has taken hold, a better class of men work at the business, more sober men. In fact, drunkenness is not permitted. The organizations take that matter up themselves, and in many ports when a man becomes drunk he is fined \$5 and is not permitted to work until that fine is paid. In a good many of the ports the men prohibit liquor from going aboard a vessel.

Q. During working hours?—A. During working hours. In that way we have gained favors from the lake carriers, and they have become our friends instead of fighting us as an organization. Our wages have increased 100 per cent since the abolishment of the contract system.

Q. What nationality prevails among your membership and workers?—A. Well, that changes. The Irish-American did prevail, but they have gone away gradually. Sometimes during these troubles in the lake ports they became disgusted, and got away and looked for other occupations, and in many cases many of the old Irish-Americans died away, and the younger element is creeping in. The young

American is becoming now quite a factor, but we have a good many different nationalities in ore receiving points, such as Italians, Finns, Huns, Slavonians, Poles, and Germans. But it would be hard to say which element is in control of the organization. I should judge, though, that the young American is quite a factor to-day, since conditions have improved. But very few young Americans worked on the lakes under the old system.

Q. Could you give the commission anything like a review of the scale of wages that is paid to these different classes on the lake?—A. Yes. I have a table of them, and the figures show you what we have done as an organization. I have the figures in the Buffalo grain contract, the figures that were paid for our contract. It amounted to \$13,627.23.

Q. (By Mr. LITCHMAN.) That is for the last season?—A. For this last season. Q. How long a time did your season cover?—A. That was from the opening of navigation, which opened last year, I think, in Buffalo in April, and which closed in December just before the holidays. There were 900 men interested in that contract. I have here a scale of what our men averaged during the working hours for the summer season. Of course, this is taken from those agreements. Later on I will relate to you these different agreements. The average wage per hour for ore shoveling in the handling ports was 60 cents per hour for a 12-hour work day. The average wage per hour for coal trimming—that is, in the loading ports—is 60 cents per hour for a 12-hour work day. The average wage per hour for fueling is 40 cents per hour, 24 hours. They have to work all hours.

Q. How many shifts?—A. Two shifts. Hoisters and engineers, from May 1 to December 15, \$80 per month for hoisters and \$85 per month for engineers. The average wage for coal handlers, 60 cents per hour; that is, in the unloading ports. The average wage for lumber loaders per hour is 50 cents. In some ports it is 40 cents, some 45, some 50, some 60; but I have struck an average there of 50 cents; that is, for a 10-hour work day. There are cases, absolute cases, where men work over 10 hours. Average wage per hour for lumber handlers—that is, at the unloading ports—is 50 cents per hour. Some places do not pay as much as that; some pay a little more. That is the general average. Now, the average wage for marine firemen during the navigation season per month is \$45. The average wage of the grain scoopers per hour is 60 cents. The average wage per hour for grain trimmers is 60 cents and upward. There are a few cases where they do make more. The average wage per hour for marine package freight handlers is 30 cents per hour. They work 10 and 12 hours, and as high as 24 hours at a stretch; no shifts. Ore trimmers, 60 cents per hour, and they work all hours. At some ports they regulate their gangs and take their turns about, but they work pretty much all the time; they have no certain hours. That completes the table.

Q. Would you say that those wages were 33 per cent greater than they have been heretofore, before your organization had jurisdiction of the ports?—A. Yes; I should say 50 per cent higher than before our organization. We were granted a 33½ per cent increase last year in the ore-handling ports over the season previous to that. That was a voluntary increase conceded by the dock handlers to our organization as a whole; so I would be pretty conservative in saying 50 per cent.

Q. In the contract is the whole of your force under the control of officers of your local?—A. Practically under the control of the local, and let out to members of our organization as a whole.

Q. Are the men divided into gangs by the organization?—A. Yes; and the officers instructed by the organization as a whole.

Q. So that your organization practically covers the labor of those ports?—A. Yes.

Q. Do you find any friction with many of your members in your locals on establishing what you may call temperance rules?—A. No; we do not. The majority of our men are determined that the temperance rules shall be prevalent in every port. We have isolated cases where our men break the rules, but they are punished by the organization. There is a happy change on the lakes in regard to the drinking question since the organization took hold, which is readily acknowledged by members of the Lake Carriers and Lumber Carriers' Association.

Q. Now, how do you account for that? Is it that the men are saving and not spending their money in saloons, or is it on account of the danger that is attached to a few drunken men coming in contact with machinery, or is it the sentiment?—A. No; it is not a sentimental idea. It is business. The men work in gangs. I will try to give you an illustration. I used to shovel iron ore myself, and I used to shovel coal in the hold, and I have worked at the lumber business unloading lumber. We worked in gangs in handling iron ore. In the port that I worked in we worked 2 men together, partners in the hatch. There were 8 men employed,

2 men to the bucket; 2 men on the starboard side of the boat worked forward, and 2 men on the port side worked forward. I am speaking now of the forward hatch. Two men worked amidship on the starboard side, and 2 men worked amidship on the port side. Those men were expected to keep the hook going. There is a hook that is lowered which the men hook on a bucket. Those 8 men are supposed to keep that hook going, and if they do not, it is readily to be seen that somebody is shirking. Suppose I am working alongside of a man and he shirks. I will readily know it. If he happens to be unwell, I will try to work a little harder and keep that going. It would be impossible to do that for any length of time. If he was drinking, I would complain. I would say, "Tom," "Dick," or whatever his name might be, "you are shirking—you are not doing your duty;" and if he was drinking and shoveling iron ore, the only way he could stand that work would be to keep on drinking. That is the only way he can stand that work. If he drinks very much, he is of no use to me, and he practically kills me and kills himself, and I complain to the foreman of the gang and that man is immediately called out of the hold and punished. He is called out of the hold and another man is put to work from another gang, and he takes his place, and this man then is displaced. It is not altogether sentiment. Of course, when our organization was first started, it was done to get rid of that drunken element and bring more sober men into the business. There is to-day a different class of men that work on the docks from what there was 10 years ago.

Q. Higher class?—A. Higher class—more healthy class of men. They own their own homes on the lakes. Very few men owned their homes 15 years ago on the lakes. I think I would be safe in saying that 50 per cent of our men on the lakes own their own homes.

Q. Since when?—A. Well, during the last 4 years. Years ago the conditions changed materially and each year as our organization has grown and there has been more traffic our men have enjoyed better wages and have been in condition to purchase and own their own homes.

Q. (By Mr. FARQUHAR.) Have you a general agreement with the owners of lake vessels as to your wages and time of work and rules of labor and jurisdiction?—A. We have a general agreement with the Dock Managers' Association. The dock managers represent the ports of Sandusky, Ohio; Lorain, Ohio; Huron, Ohio; Cleveland, Ohio; Fairport, Ohio; Conneaut, Ohio; Ashtabula, Ohio; Erie, Pa., and Buffalo, N. Y. I believe I omitted Toledo, Ohio. They represent the different men interested in unloading iron ore. The dock managers as a rule own and control certain lines of boats. They bring the ore to those ports, which is unloaded and put into cars, some of it. When there are not enough cars there it is dumped on the dock. It is stocked in the winter months. Then it is unloaded and put into cars. Now, we have an agreement with the dock managers for the unloading of the boats during the summer season. We secured last December an agreement for the first time with the dock managers for the handling of this ore from the stock piles to the cars. We have both of those agreements. Prominent among the dock managers are M. A. Hanna & Co., the Carnegie Steel Company, the Pittsburgh Steamship Company, the Angeline Steam Dock Company, and such firms as that.

The first agreement that we made with the dock managers was a year ago, the 15th day of March, 1900, and this agreement I can submit. It is the winter contract. I also submit the spring contract. You will notice the arbitration clause there. That agreement is for the unloading of the iron ore, stipulating a wage rate for the hoisters, engineers, dock firemen, and laborers in general employed on the ore docks—brakemen.

Q. In cases of disputes between the officers of your locals or even your gangs in respect to wages or the construction of these contracts or hours of labor, how do you manage to make settlement of them?—A. You will notice in that agreement, in section 6 of the summer scale, it says, "It is understood that occasionally, when any unusual work arises in isolated cases not covered by this agreement, the men, when called upon, shall perform such labor, and the compensation therefor shall be determined and adjusted between the representatives of the local organizations and the dock managers or owners, and in the event of any disagreement, shall be arbitrated as hereinafter provided for the arbitration of differences, controversies, or grievances."

Section 7 says: "All items not mentioned in this contract or the schedules hereto attached shall be performed, and all payments shall be made for work done under this agreement in accordance with the usual custom heretofore prevailing upon the respective docks."

Q. So that in case of a disagreement as to the rates or manner of unloading, your men go to work?—A. Our men go to work.

Q. And it is ultimately settled by arbitration between the dock managers?—A. Not exactly arbitration, but by conciliatory methods. It is simply by the foreman of the gang and the general superintendent.

Q. Committee arrangement?—A. By committee arrangement. But we have this arbitration clause in here; I will read it to you. This is section 8.

(Reading:) "In the event of any controversy arising between the men or local organizations and the dock managers or owners, or in the event any of the men or local organizations have any grievances, the men shall continue to work, and any and all such controversies and grievances shall be settled, if possible, by the representative of the local organization and the representative of the dock managers or owners."

That is the first method that is pursued, and it has been successful.

(Reading:) "If such controversies and grievances can not be so settled, then they shall be arbitrated by choosing a third disinterested man upon whom the representative of the local organization and the dock managers shall agree, and the decision of any two shall be final. If the representative of the local organization and the representative of the dock managers or owners can not agree upon a third man, then each side shall choose a disinterested man, and the two disinterested men thus chosen to choose a third disinterested man, and said three men shall constitute a board of arbitration, and the decision of a majority of said three shall be final and all parties shall abide thereby."

Q. What has been the practical effect of that rule?—A. The practical effect of that has been the means of keeping the men at work. We have not had to resort to the arbitration clause—only once actually have we had to resort to the arbitration clause.

Q. You have been able to settle it by a committee?—A. Through a committee, by conciliatory methods.

Q. By a committee of parties directly interested?—A. Yes.

Q. Then does that account for the infrequency of strikes of late years?—A. That is the reason that there have been so few strikes on the lakes.

Q. If that agreement was carried out in good faith by both parties, would there be any opportunity for strike?—A. No; and it would be the solution of labor troubles.

Q. Is it satisfactory to both parties now or have you some trouble in getting the agreement annually?—A. No; I do not think we have any trouble. We expect Wednesday to meet with the lake carriers and secure a renewal of the grain contract in Buffalo, and Thursday with the Lumber Carriers' Association, which has just been newly organized. They control the loading and unloading of lumber on the Great Lakes. They meet Thursday in Detroit. We expect to have a conference with them which will bring about good results. We expect next March to meet with the dock managers and secure a renewal of our agreement. I do not believe there is any intention on the part of the dock managers to break away, but they rather prefer to do business with our organization than to do business under the old system. We expect to meet with the different freight dock managers during the spring and make individual agreements. We have done that in certain points for package freight.

Q. In cases of attempts to break those agreements and also troubles that occur in your business, do the dock managers and owners and other parties in interest there quite freely receive your complaints and listen to them and enter into negotiations?—A. Yes.

Q. For the settlement of them?—A. Always willing to meet a committee of our organization when there is anything that the men think that is wrong.

Q. Have you practical control of the various lines on the lake—of the loading and unloading?—A. Yes.

Q. Of all of them?—A. Well, of all the unloading, I may say—of all the unloading of iron-ore boats, and practically of the loading and unloading of lumber and cedar, and of the loading and unloading of coal. I think if you were to meet any fair-minded lake interests who have dealt with our organization, they will tell you they would rather do business with our organization than under the old system, because they get a quicker dispatch. I have lived on the water all my life, worked on the water most all of my time, and at no time on the chain of lakes have boats been given the dispatch that they have the last season.

Q. Are your officers able to furnish men immediately at call?—A. Yes; we have had no complaints in that regard, with a single exception—no serious complaints with the single exception of one particular port, or two ports, rather, and that was not our fault. It was late this fall, and they crowded the lumber. Freight rates took a rise. You see, freight rates are not steady—freight rates on carrying one particular freight—and freight rates increased in the lumber-carrying

ranch this fall, and there was then a rush in that particular market, and the lumber rushed to Cleveland, and at one time it was impossible to take care of it with the quick dispatch that had been given. That was about the time of the losing of navigation; but no complaint was entered, and even the docks could not take care of it. It was not our men's fault, exactly, because it was the fault of the increase in the freight rates that was really to blame.

Q. In previous years the men took advantage of the rise in freights, did they not, both in ore and lumber?—A. Under the old stevedore system; I can not say that they have under our organization.

Q. Under your arrangement there seems to be an even wage and time going through the whole of it, so that with a change of freight rates on the lakes really your men do not get the advantage that they did in former times by these rapid rises?—A. Yes, the men did get it; the men had to have the work to get it under the old-time stevedore method. The marine traffic has settled more of late. Now, last year that was a little on boom times, and we got a voluntary increase, as you see by the agreement, which was a very desirable change; and that was the means of bringing about a closer relation between our organization and the dock managers, and the dispatch has been everything that could be desired. Under the old stevedore system, of course, the advantage is taken of doing business with responsible parties. Of course we might not be considered responsible on account of the financial part of it, but we try to be responsible by doing good work so as to bring about a closer alliance between our employers and ourselves. We want the pleasant features to continue.

Q. Do you think you are now sufficiently organized so that as a unit you could contract, be a party to a contract for doing the work in any ports on the lakes?—A. Yes; if the lake carriers, or lumber carriers, or dock managers were desirous of entering into a contract with us to do any work in every port on the chain of lakes, I believe we are strong enough to do the work and give it proper dispatch.

Q. Now, out of all those engaged in this longshoremen's work on the lakes, what proportion does your organization hold in numbers?—A. On the Great Lakes?

Q. Yes, on the whole lakes?—A. Somewheres from 20,000 to 25,000. I believe 25,000 men is a conservative estimate.

Q. That is your membership?—A. Yes.

Q. Now, how many are engaged altogether, nonunion men, of course, and everything included?—A. I believe that we have all the men on the lakes with the exception of about 1,200 or 1,500. I do not believe there are 1,500 men on the Great Lakes that are nonunion men and not members of our organization; and that 1,500 is in the ports of Chicago, Milwaukee, and Buffalo. We have the men in Buffalo to do the work, but through a factional fight in the stevedores, the system has become so objectionable that our men refuse to work under the present conditions. We have the men to do that work, men who have done that work but who are not working at it now. In the port of Chicago—that is, in the package-freight end, and some of the freight handlers in Milwaukee—we have not got them—and some in Duluth. Outside of that I do not think that there are 1,500 nonunion men working on the Great Lakes to-day—1,500 men who are not in the employ of the organization. There may be, but I do not think there are.

Q. Do you think it would be an advantage to your organization and to the workmen themselves were they to make a direct contract with the ship-owners?—A. Yes; I do think it would be far better for them. The system under which we have been working has the business idea of giving dispatch to both. With the railways running parallel along the shores of the Great Lakes, it is hard competition for the boats. In some instances where freight rates increase, the railways get the work. Our men are learning that it is necessary for them not to attempt to boost their wage rate out of proportion or they will drive the traffic to the railways. They are fast learning, and therefore they are desirous of keeping work on the lakes and giving the boats the dispatch that is essential. In these days it is necessary to have quick dispatch both in loading and unloading boats, and our men realize it and are getting more interested and more educated along marine lines than they were under the old system. Under the old system they were not interested parties. To-day they are interested. They are practically all contractors. They are individually very enlightened men to-day, and every man who works at our business is individually interested in the unloading and loading of the boats on the Great Lakes, both in the question of dispatch and freight rates, because freight rates regulate our wage rate to a very large extent.

Q. Instead of a hard and fast agreement as to rates, either your summer or your winter scales, have you ever taken into account a sliding scale, so that you could get near a partnership in freights rising and falling?—A. In one of our confer-

ences there was something like that talked of. It is being talked of now by the lumber carriers. They meet this week, and that is one of the important things that they are going to discuss, the question of a sliding wage scale. I believe we should be only too willing to meet them and discuss the matter of a sliding wage scale to be in conformity with the sliding freight rate. We have had some discussion of that prior to this, several years ago, and I well remember in one instance where the men voluntarily decreased their wage rate a shilling a thousand. I will submit this card to you. [Witness produces card.] That is the system under which we work in the loading ports. This is something we are trying to bring about with the lake carriers and the lumber carriers, a uniform wage rate, a uniform wage scale for the unloading of boats. Now, you see the conditions which exist in the ore unloading ports. Here we have that agreement because it is a uniform rate. One dock manager is not in sharp competition with another dock manager, because the wage rate now is the same in all the Lake Erie ports. This wage scale was brought about last July and took effect the 1st of August. Now, this scale of unloading lumber was brought about through conferences with individual lumber carriers, and what they were desirous of having was a uniform scale of unloading in each of the unloading ports, so that when they load they know what they have to pay in the unloading ports. Part of their profits went for loading and part for unloading, and as our organization has become an important factor in the loading and unloading on the Great Lakes, so the lumber carriers and other gentlemen have been desirous of getting more closely in touch with us as a business organization, and the lumber carriers meet Thursday, and that is one of the matters which will be discussed, a sliding wage scale in conformity with the freight rate; in other words, that the freight rate shall regulate the wage rate.

Q. I see that you have in your rules and regulations here a positive rule for all classes of your workers, saying, "It is distinctly understood that the men shall continue to work under all circumstances pending arbitration." Has that rule been universally carried out?—A. Yes, with the exception of one case. In the spring of the year the men were not thoroughly acquainted with every section of the agreement. It was our first complete agreement that we had which covered many ports. Now, in this agreement probably 10,000 men were interested, and probably more. We got out the proceedings in book form there, which is not very lengthy, and we distributed probably 25 copies to each branch. We saw that the men could not become educated to every detail of the contract. This fall we had 10,000 copies printed—8,000 in English and 2,000 in German or Slavonian. Of course the Italians we organize in separate branches, and we send them copies in English and then they get them translated and printed in their own language. In that way we have managed to place a copy of this agreement in every man's hands, so he could become acquainted with it. Last spring our men had a little misunderstanding in Conneaut, and the manager and superintendent wired me the particulars and I went there, and the boats were stopped at my request, the superintendent agreeing to it. He did it very pleasantly. He wanted to extend the agreement. We went to the hall, and every condition in the agreement was explained to the men, and after that the men never stopped work. The superintendent said, "I want you to continue to work under extraordinary arrangements, under some arrangement even that is not covered by the agreement, the men to continue to work, and it is to be left to the international officers to settle." And there was a question of overtime which was settled in five minutes after I struck the port—five minutes, rather, after I got into conversation with the general superintendent—a question of \$400, and that was immediately ordered paid. There was only one case after that where the men did not conform to that, and that was in the city of Cleveland. I believe that was in either August or September.

Q. (By Mr. LITCHMAN.) Do you find this agreement satisfactory to the dock managers?—A. Oh, yes; the dock managers were a party to it; they proposed those things.

Q. What I mean by asking the question is, do you find that the result of the agreement is satisfactory to them?—A. Oh, yes; very well satisfied; if they had not been, they would not have entered into this fall agreement.

Q. So far it has resulted in bringing about more pleasant relations between employer and employed?—A. In every way; oh, yes.

We have never had to resort to the arbitration clause, only in one case; it has been done by conciliatory methods. The very fact that this agreement is entered into between the men and the companies and the pleasant relations that exist— from that fact there has never been any occasion to resort to any arbitration at all, only in one instance. Perfect harmony and the very best of friendship exist

between the employers and employees. I believe these agreements are the solution of the labor question.

Q. Have your men in the longshoremen's unions become educated so that they realize that fact themselves?—A. Yes, yes; they do.

Q. And they give loyal obedience to the directions as interpreted by your association?—A. Yes. You must remember that the conditions on the Great Lakes have in the past been so bad under the old stevedore bossism that the men who had gone all through that were not men; they were brutalized; they were forced to use their muscle; and it was either a question of stand up and fight for your rights or else be kicked off the docks and be kicked to pieces in many cases; and many of our men were forced to become brutes. In fact, the wiping out of the stevedore system was done by brute force, by physical force. But as the organization has grown, and as it is going on, and getting in closer touch with the employers, our brains have taken hold instead of muscle, and the conservative man, the man who had some business ideas, has been forced to the front; and they are the men who are leaders of our organization to-day.

Q. Has your organization, so far as its influence predominates, eliminated this evil of which you complain?—A. Yes.

Q. The saloon evil?—A. Yes; it is wiped out now. The only places where it exists to-day are at Buffalo, Chicago, and Milwaukee.

Q. And those are the 3 places where your organization is weak?—A. The only 3 places that—I will not say weak. In Buffalo we have got a hard fight. We have not yet put up any fight in Milwaukee or Chicago, nor do we want to put up any fight. We would rather use, and have always preferred, conciliatory methods instead of physical force. The men who have charge of our organization to-day are conservative; are men who have worked almost all their lives upon the docks, and they are men who have some business ideas and do not want to see strife on the docks, because it hurts us in other ports. Suppose we had men in charge of our organization to-day who would go to a port and inaugurate a strike, what would it mean? It would mean suffering. Suppose it would be an unloading port, the men in the loading port would suffer. It would spread and be the means of hurting us in other ports. So we aim, where these unpleasant features exist, to try and bring about better conditions along conciliatory lines, meeting with the employers.

Q. And your action in this respect meets the hearty cooperation of the employers?—A. Yes; we are, as you say, weak in a great many ports, but instead of resorting to strikes we have resorted to the method of meeting with the employers, explaining it to them, and got them interested, and to-day the present officers of our organization have never yet ordered a strike in any port. We have always prevented it, if possible. We never sanctioned a strike on the lakes yet.

Q. (By Mr. FARQUHAR.) Previous to your unions having jurisdiction over this class of labor on the lakes there, how many strikes would occur in a week during the running season in a port like Buffalo or Cleveland or Toledo or Milwaukee?—A. There would be, most likely, a strike every day.

Q. Would there be more than 1 strike a day?—A. In the large cities?

Q. Yes; take it in lumber, coal, ore, and everything, would you average a strike a day at those ports?—A. I would not mention Buffalo alone, but I mean at all the ports. In all the ports—and I have visited almost every port on the lakes—it was a common thing to see boats tied up in most every port always, most every day. In the competition between the stevedores the fellow that had the best fighters back of him was the fellow that was trying to have a monopoly, and it was a fist fight most every day.

Q. So that your organization coming in now has been a complete revolution in that branch?—A. Yes; I can honestly say that our organization has been a complete revolution in the conditions that existed on the chain of lakes for a great many years. Instead of the drunken, poor, dissipated fellow that used to work on the docks, to-day the good, sober man is prominent. We have many places where they own their own homes and have built their own meeting halls and have temperance societies. There is one place in Ohio where there are Finns who have organized a temperance society, built a hall, and turned around and gave a deed of the hall to the organization. At another port where a lot of our men work for M. A. Hanna & Co., our men have built a hall, paid the cash for it. Three hundred members assessed themselves \$10 apiece and paid the cash for the lot and built the hall, and finished it off in Southern pine, and have got a nice hall, and there they meet and have entertainments. I was there at two of them in Loraine, Ohio, this fall, and I know of one instance where our men got together, had a banquet, and invited all the leading business men, the mayor of the city, their employers, master mechanics, and superintendents of the docks, and they enjoyed themselves very much.

Q. (By Mr. LITCHMAN.) The closed season covers about 4 months, when navigation is closed on the lakes, does it not?—A. Sometimes more. Generally December, January, February, and March, those 4 months. Sometimes it will close the middle of November, and sometimes not open until May, but, as a rule, 4 months.

Q. Now, have you any means of knowing what employment your men seek during those months?—A. This winter we have just got an agreement covering the iron-ore ports whereby about 10,000 of our members will be kept at work this winter in the upper ports on the lakes—that is, in Minnesota, Wisconsin, and upper Michigan ports. Many of our men go to the woods and work in getting out the logs, getting out the timber, ready for the spring. But in the cities our men have become accustomed to save during the summer season, and in some instances they buy in quantities, buy at wholesale for the winter, buy provisions at wholesale, so many tons of coal, so many barrels of flour, and in the winter they do not do anything; they earn good wages, and they earn enough to rest during the winter months. And then, too, a good many of our members are interested in their homes. In the summer they are kept very busily employed, and there is not much opportunity to look after their homes. So they see about their homes and look after their children getting an education. I know of many instances where our men have their children taking music lessons and have pianos. Twenty years ago there were not 20 per cent of our men that had children taking music lessons, and I do not believe there were 10 per cent that cared whether their children went to school or not; and 10 years ago there were not 20 per cent married, and now 90 per cent are married and are raising families.

Q. (By Mr. A. L. HARRIS.) Does this condition obtain all over the territory covered by your organization?—A. These conditions obtain all over the Great Lakes. These conditions that existed on the Great Lakes never existed in the coast ports to such a great extent. There are, of course, ports on the coast where the same conditions prevail to a smaller extent. But we have not been able to give the time to coast ports that we have to the lake ports. Where we have been appealed to we do.

Q. (By Mr. FARQUHAR.) What is the average attendance of members at your local meetings? How frequent are the meetings—monthly or weekly?—A. It is according to the location—according to the method of work. In the summer season about twice a month. Some of them meet weekly—that is, in the summer months. In the winter season in the ports on the upper lakes they do not meet at all. There is no idea of meeting for simply creating trouble. If they do meet, it is for discussing the wage scale and trying to remedy defects that exist.

Q. Where you have no halls, have you any meeting rooms and committee rooms where they can meet?—A. We always own halls, or rent halls if we do not own them.

Q. So you always have a local habitation, as it were, for your members?—A. Yes; about 60 per cent of them. In some localities the men are compelled to attend their meetings regularly, and that is one of the rules that is carried out and enforced.

(Testimony closed.)

WASHINGTON, D. C., January 18, 1901.

TESTIMONY OF MR. F. T. LINDENBERGER.

Chairman of the committee on hostile legislation, American Ticket Brokers' Association.

The commission met at 10.57 a. m., Vice-Chairman Phillips presiding. Whereupon Mr. F. T. Lindenberg, chairman of the committee on hostile legislation of the American Ticket Brokers' Association, Detroit, Mich., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. KENNEDY.) Will you please give your name and post-office address?—A. F. T. Lindenberg, Detroit, Mich.

Q. State your business.—A. Ticket broker.

Q. Are you connected with any organization of ticket brokers?—A. American Ticket Brokers' Association.

Q. Have you official connection with that body?—A. My title is chairman of the committee on hostile legislation.

Q. How large a membership has that organization?—A. I think about 330.

Q. Are the objects of the association stated in your testimony, as prepared?—
A. Yes.

Q. You have a prepared statement?—A. Yes.

Q. Would you prefer to make your statement uninterruptedly and answer questions afterwards, or answer questions as you go?—A. I would prefer to be allowed to go through with the testimony, and then shall be glad to answer any question any member of the commission may desire to ask.

Mr. KENNEDY. You may proceed, then, with your statement.

The WITNESS. Mr. Chairman and gentlemen: I have tried to follow as nearly as possible the topical plan of the inquiry as outlined by the commission, and then to afterwards answer the charges against the business of brokerage that have been made by those who have testified before. Your plan of inquiry as to ticket brokerage covers the following heads: (1) In what the practice consists; (2) mileage books and excursion tickets; (3) number of people engaged in the business; (4) by whom carried on; (5) effect on passenger travel, interstate and intrastate; (6) to what extent it is encouraged by railroads and for what purpose; (7) laws prohibiting it; what States have enacted such laws; (8) Arguments for and against such practice.

The first question therefore is:

IN WHAT THE PRACTICE OF TICKET BROKERAGE CONSISTS.

I reply, in the buying from the agents of railways and from passengers of passage tickets and selling the same to travelers at a less price than the published tariff rates.

MILEAGE BOOKS AND EXCURSION TICKETS.

Ticket brokers deal largely in mileage books, which are usually purchased by the broker direct from the various companies and are sold to patrons who have use for a less quantity of mileage than is contained in a full book. The broker is enabled to do this by a rebate system, the passenger paying for the full value of the book and receiving a rebate order on some correspondent of the broker in the city for which he is bound.

Where the customer is known to the broker it is a very common practice to allow him to return the book by mail.

In the New England States and in New York State books are good in the hands of the bearer, and on a large number of roads in various parts of the country the same rule prevails, notwithstanding the fact that persons buying these books are compelled to sign an alleged contract containing restrictions as to personal use and providing for the confiscation of the book by the conductor should the book be used by other than the original purchaser.

The following letter from the general passenger agent of the Lehigh Valley Railway will be interesting in this connection [reading]:

[“Lehigh Valley Railroad Company, Havemeyer Building, 26 Cortlandt street.]

“NEW YORK, October 31, 1900.

“Mr. THOMAS R. GREEN, Woodmont, Conn.

“DEAR SIR: I have yours of 30th regarding the loss of your mileage book No. 75240 and regret to state that owing to the manner in which these books are issued, viz, good in the hands of the holder, our auditing department has been obliged to discontinue the bulletining of same as per circular attached.

“Yours, truly,

“CHAS. S. LEE, General Passenger Agent.”

I have here a cover of a mileage book of Lehigh Valley issue, under date of June 11, 1900, which contains the ordinary so-called contract, with all the restrictions, etc., and while the contract states that the book is not transferable and will be taken up by the conductor if presented by a person other than the purchaser, this letter is proof positive that it is not so. In some of the States, notably New York State, the law requires that mileage shall be good in the hands of the holder.

Q. (By Mr. PHILLIPS.) Is not that a just and equitable law?—A. I believe so; judging from a ticket broker's standpoint. In certain sections what are known as interchangeable mileage books are exclusively sold. I have here a specimen

of the books sold in the territory of the Central Passenger Association, in which 37 lines have combined in the issue of a 1,000-mile book. The passenger is required to pay \$30 for the book, and should he use all of the 1,000 miles on any one or all of the 37 roads, he is entitled to a refund of \$10 on return of the cover. In issuing this book the railroads have reversed the usual custom of the ticket broker. The broker handles the book on a given road for the use of two or more men, while this interchangeable book is good for the use of one man over 37 roads.

I believe the issue of this book is a very great discrimination, inasmuch as it permits the holder to obtain a 2 cent per mile rate over a given distance on a certain road, while another person for the same service must pay 3 cents per mile. The passenger who profits by the 2-cent rate is not compelled by the terms of the interchangeable book to again patronize the road in question, but can use the balance of his mileage on any competing line or lines.

Q. Does that cause great annoyance to the passenger?—A. It may not sound right for a ticket broker to find fault; the book is objectionable, from a business standpoint, to the ticket broker.

Q. Well, is it not from the public standpoint?—A. It is an inconvenience to the public; nearly all travelers object to it, object to the amount of money which they have to invest.

Because of the amount of money involved in the handling of this interchangeable book many traveling men arrange with a ticket broker to advance the necessary money and carry the book for him. I know of brokers who thus act as banker and broker for traveling men in the handling of this special character of transportation, some carrying as high as 200 books for these special customers.

The traveling man is obliged to invest \$30 when he gets his book; he can't cash his book cover and recover his extra \$10 investment until the mileage strips collected by the various conductors have gone into the auditing department, and if he wants to travel farther he must invest another \$30. I have heard traveling men say that they have been obliged to carry two or three covers in which they had that investment of \$10 each before they could get returns from the mileage bureaus.

EXCURSION TICKETS.

Excursion tickets provide a source of business to the broker. Not only does he purchase from travelers the return portions of excursion tickets, but through his correspondents in other cities to which an excursion may go or an excursion may come, both the going and return portions are used by the broker and his customers.

Advance information in regard to these excursions is frequently supplied brokers by lines interested, and through correspondence arrangements are completed by the brokers to handle the stock.

RATE-WAR TICKETS.

A very common method adopted by brokers to cut rates is the use of war-rate tickets when competing lines grow belligerent. I recall a war between the two great Canadian lines that raged for 8 months during the year 1898. One-way tickets were sold at about one-half the usual rate and round-trip tickets at a corresponding reduction. Outside of Canadian territory regular tariff rates were charged. The fare between Detroit and Windsor is but 10 cents; yet when a traveler entered a regular ticket office in Detroit and purchased a ticket to Toronto he was charged \$6.60. Across the river the price was \$3.30. In Detroit the fare to Montreal was \$15, in Windsor \$7. In Detroit the company charged \$6.75 to Niagara Falls, while all that was asked by the agent of the same company in Windsor was \$3.35.

I have here a specimen of the tickets sold at that time that I just happened to find among my ticket stock. It is a ticket between Windsor and Niagara Falls which sold for \$3.55 in Windsor; in Detroit it was \$6.75, and the fare across the river 10 cents.

As is usual in such cases with ticket brokers, the brokers of Detroit sent out at that time, to their western correspondents, furnishing-rate sheets giving prices at which they would supply, on prepaid orders, various tickets to Canadian and eastern points. The prices were usually an advance of \$1 over the war rate.

It was only through brokers that these rates could be obtained within the limits of the United States.

The agents in Detroit were absolutely forbidden to give any information to customers of rates across the river, and that situation continued for 8 months. Instances of this nature could be multiplied indefinitely.

There is to-day a war rate of 75 cents between steamship lines plying between Providence and New York. A new company known as the Joy Line has been established, and the old established lines are trying to prevent them from getting a foothold in the business, and have opened a war rate.

The railway fare between Boston and Providence is \$1, yet the through rate to New York charged at the regular offices in Boston is \$3, an excess of \$1.25 above the added amount of the two fares. It is only through the offices of brokers that travelers learn of this situation, regular agents not being permitted to volunteer information.

FURNISHING-RATE SHEETS.

A common practice with brokers favorably situated to secure tickets is to issue furnishing-rate sheets to their correspondents. To illustrate how this method can be of use, we will suppose a passenger to enter the office of a Washington broker and ask for a rate to Denver. The regular fare is \$48. The broker may have a ticket to Buffalo, or Cleveland, or Pittsburg, or Chicago, as the case may be. He then examines his rate sheets for a furnishing rate from brokers in any of these cities. If a satisfactory furnishing rate is found, and he can agree upon the price with his customer, a bargain is made. The customer takes the part-way ticket and an order upon the correspondent in the intermediate city for a ticket to finish his journey, which insures him a through passage at the agreed price, usually from \$3 to \$5 below the tariff rates. If it should happen that the Washington broker had no ticket, but the furnishing rate was sufficiently low in any of these cities for a Denver ticket, it might be profitable for him to go to the regular agent here and buy a ticket at local rates to this point. Putting the two together he would be able to make a through rate at less than the tariff.

NUMBER OF PEOPLE ENGAGED IN THE BUSINESS.

As to the number of people engaged in the business, I can not give this information to a certainty; but perhaps my estimate will be near enough for the purposes of the commission.

The 2 regularly organized associations of ticket brokers are the American Ticket Brokers' Association and the Guarantee Ticket Brokers' Association.

The American Ticket Brokers' Association has a membership at present of 335. The latest list of the Guarantee Ticket Brokers' Association gives their membership as 83. Outside of the 2 associations there are probably 50 offices. This gives the number of offices as 468. It is fair to assume that an average of 3 clerks are employed in each office in addition to the proprietor, so that in round numbers we may safely say there are 1,800 to 2,000 persons in the United States making a living for themselves by selling reduced-rate railway tickets.

BY WHOM TICKET BROKERAGE IS CARRIED ON.

In the larger cities the business is conducted by those who devote their entire time to its interests. In smaller places many of the brokers are merchants and business men engaged in various lines of trade, such as druggists, dry-goods and clothing dealers, manufacturers, dealers in cigars and tobacco, and, very frequently, persons conducting book and news stands in hotels.

Many of the members of the American Ticket Brokers' Association have been engaged exclusively in this business for from 10 to 30 years. They enjoy the respect and confidence of the communities in which they live, the great traveling public, and the railway managers with whom they deal.

Speaking for myself, with a record of 19 years as a ticket broker, I know of no persons to whom I could more safely refer for a certificate of character than to the railway-passenger men of my home city, and yet many of them are strongly and even bitterly antagonistic to me from a business standpoint. What I can say for myself can safely be said of a very large majority of members of the American Ticket Brokers' Association, which I have the honor to represent before you to-day.

Now I would like to show this commission something of the character of our organization of ticket brokers. This is perhaps best illustrated by our constitution and by-laws. Our motto translated into English means "Our protection travels with you," and illustrates the rule of the association that all transactions of its members with the public are guaranteed by the association.

The association was organized 22 years ago. I submit a copy of the constitution and by-laws:

CONSTITUTION AND BY-LAWS OF THE AMERICAN TICKET BROKERS' ASSOCIATION.¹

[With amendments to and including the twenty-second annual convention, May 9 and 10, 1900.]

CONSTITUTION.

ARTICLE IV.—*Members.*

1. Any person of good moral character, who possesses the necessary ability and capital, shall be eligible to membership in this association upon payment of an initiation fee, if in the judgment of the executive committee the location will admit of the admission of the applicant.
2. If the executive committee shall entertain any just or reasonable doubt of the stability of the applicant, the committee may impose the condition that he shall have been in business for himself for not less than 3 months in the city in which he wishes to locate his office.
4. No member shall hold more than 2 memberships for any 1 city, nor more than 5 in the association.
5. No membership shall be operated except by the member and in the city for which it was originally issued, except under the provisions of the first section of the fifth article of this constitution.

ARTICLE V.—*Memberships—Transfer or sale*

1. A membership under which the holder has conducted the ticket-brokerage business for a term of not less than 6 months may be sold, transferred, or assigned by its holder to any person eligible to membership, provided the executive committee approves the sale, transfer, or assignment.
2. The association shall hold a first lien on the memberships for any debts due the association or its members. All claims against a membership shall be adjusted before it is sold, assigned, or transferred.

BY-LAWS.

ARTICLE II.—*Local divisions.*

1. In every city where there are 3 or more members, the members shall organize a local division on the plan upon which the majority of members may agree, having in view the following objects:
 - (a) Uniformity of selling rates.
 - (b) The destruction of hostile competition.
2. Local divisions shall be entirely free to adopt such rules and regulations for self-government as they may elect, provided they do not conflict with the constitution and by-laws of the American Ticket Brokers' Association.
3. Where there are only 2 memberships, and a division of opinion exists as to forming a local division, the members shall refer the matter to the president, who is empowered to decide it.
4. Any violation of the rules and regulations of the local division may be brought through the chairman or secretary of such division before the executive committee, which committee is empowered to punish the offender by a fine not exceeding \$100, suspension, or expulsion.

ARTICLE III.—*Initiation fees and annual dues—Publication of applications*

3. In cities where 1 or more memberships are operated, the initiation fee for new applicants shall be 40 times the amount of the prescribed fee, as follows: Class A, \$1,000; Class B, \$600, Class C, \$400, Class D, \$200.
4. The initiation fees and dues for additional offices shall be the same as those required of new applicants.
5. Notice of the filing of applications for memberships in this association, with names of the cities for which the memberships are desired, and the full names of the applicants, shall be published in at least 1 issue of the Correction Sheet, and no action shall be taken on applications by the executive committee within less than 15 days after such publication.

ARTICLE IV.—*Offices*

1. A member desiring to establish an additional office in the city where he is located shall obtain the consent of the executive committee before opening such additional office, giving the exact location, and make application for admission in the prescribed form.
2. The executive committee may grant such membership for the proposed additional office if in their judgment the location will warrant the admission of the applicant.
3. A member desiring to establish an office in another city must obtain the consent of the executive committee before opening same and then proceed in the manner prescribed in section 1 of this article.
4. No member shall change the location of his office without first obtaining the consent of the executive committee.
5. No member shall conduct his business in any place where liquor is sold, nor in any place objected to by the executive committee.

¹The following extracts from the constitution and by-laws of the American Ticket Brokers' Association will give an idea of its plan of organization, etc.

ARTICLE VI.—*Rebate and prepaid orders.*

1. All association rebate orders, when properly drawn by members in good standing, shall be honored without question.
2. Rebate orders shall be drawn exclusively upon association blanks, and must be stamped and dated with an office dating stamp.
3. Overdrafts may be made at the pleasure of members, and subject to mutual agreement.
4. All overdrafts must be returned for collection to the office drawing same within 90 days from date of sale of the ticket. In case this requirement is neglected, the office holding the rebate order shall have no claim against the issuing office.

* * * * *

ARTICLE VIII.—*Guaranty.*

1. Every member shall, when requested by a passenger purchasing a ticket, guarantee the same in writing.
2. Upon failure of a member to make good any written or verbal guaranty to a passenger, the same shall be done by the association when so decided by the executive committee, the amount to be charged to the member.
3. Whenever a ticket or coupon purchased of a member by a passenger is not accepted for passage, through no neglect of the passenger, and the passenger is obliged to pay fare, the full amount of fare so paid shall be returned to the passenger.
4. Whenever a ticket is sold without recourse, wholly or in part, the same shall be stated in writing by the passenger at the time of such sale.

ARTICLE IX.—*Arbitration—Costs.*

1. All cases in dispute, whether between members or between patrons and members, shall be assigned directly to the executive committee, as a board of arbitration, from whose decision the right of appeal shall lie to the annual convention.
2. Notice of appeal must be given, and the amount involved deposited in the general office within 20 days from receipt of notice of the finding.
3. A member failing to comply within the specified time with the requirements of the decision of the board of arbitration, or to file an appeal, shall be suspended from the rights and privileges of membership.
4. A member failing to pay into the general office, within 3 days after notification by the secretary, a claim or balance due this association, a member, or patron, shall be liable to suspension.
5. Amounts so paid into the general office shall be subject to subsequent adjustment, as provided for in the first, second, and third sections of this article.
6. A fee of \$3 and 5 per cent of the award shall be charged against the loser in all cases of members against members adjusted by the board of arbitration, and of patrons against members where the member loses the case. Provided, that should the respondent before trial offer to pay to the plaintiff, or admit his liability for, a part of the claim, and the board should find an award for said amount or less, the costs shall be taxed on the plaintiff. In case of appeal, the cost for the same to a member shall be an additional fee of \$5 and 5 per cent of the award. The accumulated charges shall be paid by the member losing on the final determination of the case.
7. Rehearing shall not be granted in any case decided by the executive committee or board of arbitration unless the amount involved is deposited in the general office, and petition filed within 20 days from receipt of notice of the finding.
8. No claim of member against member shall be considered by the board unless filed in the general office within 1 year from date of the transaction.

ARTICLE X.—*Misdemeanors*

1. Any transaction between a member and any person or corporation whereby the system of ticket brokerage may be liable to injury or degradation, or any act by which a member may suffer detriment in his social or financial standing, or be damaged in his business, shall be considered a misdemeanor.
2. The buying or selling of employees', complimentary, or stock passes shall be considered a misdemeanor.
3. The attempt by a member to secure the office of another member, or to cause the advancement of his rent, shall be considered a misdemeanor.
4. Any violation of the common law shall be considered a misdemeanor.
5. The punishment for committing a misdemeanor shall be by reprimand, fine not exceeding \$100, suspension, any one or all, or expulsion, at the discretion of the executive committee. If the offense is of such character as to cause pecuniary damage to either a patron, corporation, or member, the executive committee may also require such restitution from the offender as they may deem proper.

* * * * *

ARTICLE XII.—*Nonintercourse.*

1. No member shall have any transaction of any character whatever pertaining to ticket brokerage with a broker not a member of this association nor with a suspended member. The penalty for the violation of this law shall be, for the first offense, a fine of \$25; for the second offense, a fine of \$50; and for the third and each subsequent offense, a fine of \$100.
2. A member joining any other association of ticket brokers shall be suspended or expelled, at the discretion of the executive committee.

ARTICLE XIII.—*Certificate of membership.*

The secretary shall issue to every member, upon payment of his semiannual dues, a certificate of membership, duly attested, which certificate shall be good until revoked by the executive committee.

ARTICLE XIV.—*Lost, stolen, or fraudulent transportation.*

A member receiving information of any lost, found, stolen, or fraudulent tickets or passes offered for sale shall at once notify the secretary (by telegraph if the case is urgent), who shall take immediate measures to protect the members, the railways, or parties interested.

ARTICLE XV.—*Advertising.*

No member shall issue advertising matter discriminating in favor of any other member or members.

ARTICLE XIX.—*Association rate book and correction sheets.*

1. The association rate book shall be issued semiannually, in pamphlet form, by the secretary, on the 1st day of the months of May and November, or as soon thereafter as practicable. Correction sheets shall be issued semimonthly, on the 1st and 15th days of each month, between the issues of the rate book.

2. Members shall give the regular first-class unlimited, first-class limited, and second-class rates to at least 50 prominent points, subject to change without notice.

ARTICLE XXI.—*Appeals*

1. An appeal may be made from the decision of the executive committee to the annual convention, if filed with the secretary within 30 days after notification.

2. When a fine is imposed and an appeal taken, the amount of the fine shall be deposited in the general office.

ARTICLE XXII.—*Quorum*

A quorum for business at the annual convention shall be not less than 25 members.

ARTICLE XXV.—*Insolvency*

The executive committee may suspend a member upon proof of assignment or insolvency.

ARTICLE XXVI.—*Committee on hostile legislation*

1. The committee on hostile legislation shall consist of one member of the association, who shall be elected annually by the association in convention assembled.

2. The compensation of the committeeman shall be \$2,500 per annum, and such committeeman shall be at the service of the association during the entire year. This committee shall have the power to look after hostile legislation in any of the States or in Congress.

3. In the event of hostile legislation in any State, the members in such State, acting under the direction of the committee on hostile legislation, shall pay 50 per cent of the expense incurred, and the association shall pay 50 per cent.

4. It shall be the duty of the committee on hostile legislation to submit to the executive committee each month a report of the expenses incurred.

To show the commission now careful the officers of this association are as to the character of those seeking membership, and to admit only persons of unblemished reputation and known integrity, I submit copies of our application and reference blanks. In addition to these precautions, the mercantile agencies are called upon for a financial report upon the applicant. [Reading:]

AMERICAN TICKET BROKERS' ASSOCIATION

Application for membership

—, —, 189—

The undersigned hereby applies for membership in the American Ticket Brokers' Association, and makes true answers to the following questions, or others that may be asked by the executive committee.

1. Individual name of applicant for membership? (Give full name.)
2. Name of firm under which business will be conducted?
3. Give exact location of office. (City of —, county of —, State of —)
4. Will any person or persons other than yourself have any interest in the ticket-brokerage business with you? (If so, give full particulars of names and interests.)
5. What other business, if any, is or will be conducted in the same office, and by whom?
6. What other business, if any, do you intend to conduct in connection with the ticket-brokerage business?
7. What amount of money (actual cash) will you now put into the ticket-brokerage business?
8. Are you now a member of the American Ticket Brokers' Association?
9. For what city or town do you hold membership? (If more than one, name them.)
10. Were you ever a member of this association?
11. Do you belong to any other association of ticket brokers? (If so, give name of it.)
12. Have you ever been engaged in the ticket-brokerage business?
13. At what point? (If more than one, name places and length of time in each.)
14. What was your business or occupation immediately preceding your present one, and on what account did you leave it?
15. What is your present occupation, besides the ticket-brokerage business? (If more than one, name them.)
16. Where were you born?
17. When?
18. How long did you reside in your native place?
19. Married or single?
20. Have you ever been bankrupt or insolvent?
21. Did you ever compound with your creditors?
22. If so, state whether now discharged, and in what manner.
23. Give particulars and amount of any debt or liability on you are under, and state if you are indorser or surety for anyone, jointly or individually, and to what extent.
24. What resources, if any, have you outside of your investment in the ticket-brokerage business?
25. If encumbered, state how and to what extent.
26. Give names and addresses of one banker and two merchants to whom you can refer.

27. Give names and addresses of three members of the American Ticket Brokers' Association to whom you can refer.

28. Have you read the constitution and by-laws of the American Ticket Brokers' Association?

29. Do you assent to its provisions and agree to be bound thereby?

30. Do you understand and agree that any false statement or any misrepresentation in answering any of the foregoing questions, or any others relating to them, renders any membership obtained upon this application null and void?

31. (Applicant will sign here.)

NOTE TO APPLICANTS

Each and every question must be fully answered, and full name given wherever indicated. Failure to do so will delay the application.

No alterations or erasures will be permitted.

The information required in this application is for the benefit of the executive committee alone and is strictly confidential. It is essential to the maintenance of a high standard of membership, and, as it is verified from other sources, it is expected that applicants will make their answers as complete and specific as possible.

To be filed at the general office.

No. of application, _____.

No. of membership, _____.

Application published in correction sheet Nos. _____.

Class _____, Initiation fee received, \$_____, Date received, _____, 18____.

R. G. Dun & Co.'s report, dated _____, 18____, attached.

The applicant is required to give the names of three ticket brokers as a reference. The following reference blank is sent to those ticket brokers (reading):

THE AMERICAN TICKET BROKERS' ASSOCIATION.

Member's reference blank.

[Confidential]

M _____,

DEAR SIR: M _____, of _____, is an applicant for admission to this association at _____, and refers to you for recommendation. It is understood this reference does not imply an extended acquaintance or an expected indorsement, but is simply to enable the executive committee to secure as complete information as possible concerning the character of the applicant.

Will you therefore please fill up the subjoined blanks at your earliest convenience and return to the general office?

Respectfully,

Secretary of Executive Committee
(Date here) _____, 1896

1. How long have you known the applicant?
2. What are the nature and extent of the dealings you have had with him?
3. Has he always been prompt in remitting?
4. To what extent would you be willing to credit him in an ordinary open account?
5. Give a general summary of your knowledge of the applicant and your estimate of his character.
6. Understanding the high standard of membership sought to be maintained by this association, do you, on the basis of your knowledge, recommend the applicant for admission?

(Signed) _____.

This is the reference blank sent to bankers and merchants, etc., that are used as references (reading):

AMERICAN TICKET BROKERS' ASSOCIATION

Reference blank

[Confidential]

M _____,

DEAR SIR: _____, of _____, is an applicant for membership in this association at _____, and refers to you for testimony as to his character and commercial integrity. A reply to each of the following questions is requested at your earliest convenience, for the information of the executive committee only, with the understanding that your answers will be held strictly private and confidential, and that they are not to make you in any way responsible.

It is the aim of this association to admit only those of good character and commercial integrity, with sufficient judgment to enter into no contracts which they are not reasonably willing and able to fill, and these qualities weigh more with the committee than abundant capital in unscrupulous and doubtful hands.

Very respectfully,

Secretary of the Executive Committee.
(Date here) _____, 189____.

1. How long have you known the above-named applicant?
2. What opportunity have you had to form an opinion of his character and commercial integrity?
3. Are you related to him through family ties?
4. Where has he been located since you have known him?
5. In what business has he been engaged since you have known him?
6. Has he, to your knowledge, ever been suspected of fraud, dishonorable or improper conduct, or of being addicted to gambling, speculating, or drinking?
7. Has he, to your knowledge, any unsettled debts or claims?
8. Has he been prompt in settling his current expenses or other debts?
9. Has he ever been dismissed from any situation or engagement?
10. If so, under what circumstances?
11. Has he been extravagant in his habits or lived beyond his means at any time?
12. Have his associates been persons of good character and habits?
13. With this understanding of what is sought, do you recommend the applicant as a proper subject for membership?

(Sign here) _____.

Education in a ticket broker's office is a very common stepping stone to employment in the passenger departments of railways. Several prominent railroad men holding very high positions to-day received their first education in the railway ticket business behind a broker's counter.

The fact that a man has been a ticket broker does not act as a bar against his securing a place of trust and responsibility with railways, quite the contrary being the fact.

While our association holds all members to a strict accountability for their acts, we unfortunately can not control every person who chooses to go into the ticket business. There are renegade ticket brokers just as there are rascally men in every calling. The buzzard and the ticket crook will operate in spite of us and of the law, and an antiscaling law would be no check to this character of offenders.

Our association recently made the following offer of reward for the apprehension of persons who do a dishonorable business in the manipulation of railroad tickets [reading]:

AMERICAN TICKET BROKERS' ASSOCIATION, PRESIDENT'S OFFICE,
St. Louis, Mo., December 15, 1900.

Five hundred dollars reward

Announcement having been made that the Association of General Passenger Agents has appointed a committee with power to prosecute persons who may be guilty of the forgery of railway tickets or the criminal manipulation of passage tickets, it is proper to state that the American Ticket Brokers' Association is in hearty accord with the avowed purpose of this movement.

If it is true, as claimed by these passenger men, that there are ticket brokers who are engaged in criminal practices, the sooner such persons are in prison the better for the railways, the traveling public, and all honest men engaged in the ticket business.

With an earnest desire to assist in clearing the country of every disreputable character engaged in handling railway tickets, I am authorized, by and on behalf of the American Ticket Brokers' Association, to make the following offer.

For the arrest and conviction, in a court of competent jurisdiction, of any member of the American Ticket Brokers' Association who is guilty of the crime of forging a railway ticket, or who has changed the destination of a railway ticket with intent to defraud, we will pay the sum of *five hundred dollars*.

For the arrest and conviction of *any ticket broker* who is not a member of the American Ticket Brokers' Association, who is guilty of forging railway tickets, or changing the destination on a railway ticket with intent to defraud, we will pay the sum of *two hundred dollars*.

SIMON STEINER, President,
For the American Ticket Brokers' Association.

This offer of reward has been very generally circulated, and with the reward circular a copy of the following letter of our secretary was mailed to every broker in the United States [reading]:

AMERICAN TICKET BROKERS' ASSOCIATION, GENERAL OFFICE,
Louisville, Ky., December 20, 1900.

[Reward circulars.]

To ticket brokers:

You are earnestly requested to secure the publication of the enclosed circular in as many of your local papers as possible.

In offering this reward for the prosecution and conviction of ticket swindlers, the American Ticket Brokers' Association proposes to prove to the world that the slanderous stories constantly put in circulation by certain railway officials—to the effect that it is the general practice with ticket brokers to forge and alter railway tickets—are infamous falsehoods, invented and circulated for the express purpose of creating a public feeling against ticket brokerage and to so frighten timid travelers that they will buy direct at the various company offices, instead of making a saving by patronizing brokers.

This circular is also intended as a warning to any ticket broker who may be tempted to dishonest practices that the association is in deadly earnest and will spare neither energy nor money to put him out of the calling he has disgraced.

The honest and reliable broker can not afford to have reproach cast upon his calling by the rascally transactions of any crook who may put out a sign as a ticket broker and profit by swindling those who from previous experience have reason to expect honorable treatment at any ticket broker's counter. To the end that the business may be purified of all unworthy characters, the American Ticket Brokers' Association now asks, and confidently expects to receive, the hearty cooperation of every honorable person in the business.

By order of the executive committee—

W. B. CARTER, Secretary.

EFFECT ON PASSENGER TRAVEL, INTERSTATE AND INTRASTATE.

As passenger travel is always stimulated by reductions from ordinary fare, I should say that the effect of ticket brokerage is to increase travel, both local and interstate.

BROKERAGE SUPPORTED. AND ENCOURAGED BY RAILROADS.

The growth and development of ticket brokerage to the immense proportions it assumed from about 1876 to 1896 was due almost entirely to the direct encouragement and support of railways. Nearly every railroad of importance employed brokers; and when they could not make satisfactory arrangements with established offices, new offices were opened.

When I became a ticket broker, 19 years ago, I started out with the regular issues of 3 lines of railways and in the following years dealt on the most friendly terms with all the great lines that looked to Detroit for business. My experience is similar to that of brokers in every part of the country.

The purpose of using brokers by railway lines is no doubt to get competitive business which they are unable to reach by ordinary means.

Brokers who have been long established control a large trade that can be influenced by reduced fares. New lines, desiring quick introduction to the public, commonly place tickets with brokers. After their purpose is accomplished and their trade is built up to the desired magnitude, it is not uncommon for these lines to join the hue and cry against the very source of their success.

The weaker lines, failing to secure a living share of passenger traffic, frequently find that their only means of escaping the receiver is to call in the help of the ticket broker. With correspondents in every part of this great country, it is not difficult for ticket brokers to quickly influence a large passenger traffic over any line where the cost of tickets is sufficiently low.

STATE LAWS PROHIBITING TICKET BROKERAGE.

With the concentration of railway interests, the forming of pools and traffic associations, a system of persecution was inaugurated against ticket brokers.

The legislatures in all the States of the Union have been solicited time and again to pass "antiscaiping" laws. In but 10 States have the opponents of brokers succeeded in passing bills of this character. In 2 of these States the law has since been declared unconstitutional. After years of the most strenuous effort our enemies have but 8 States to their credit, while the rest (some 37) are clear from laws so antagonistic to all rules of right and justice. In the 8 States the law is so extremely obnoxious to the public that it is entirely inoperative except in the city of Philadelphia.

In Congress the fight has raged for a dozen years. Four years ago for the first time, after repeated failures, the advocates of this bill secured its passage in the House, but it failed of consideration in the Senate. Two years ago the bill was again voted upon in the House and won by a vote of 119 to 101, but again the Senate refused to vote upon the bill.

It is a fact worthy of note that the times selected to pass "antiscaiping" bills in Congress were directly after Congressional elections. The bill is very unpopular with the people, and the Congressman who would vote for it stood the chance of losing the support of a large number of his constituents.

Our opponents have claimed some 381 newspapers as opposed to ticket scalping. I have not the statistics—but they are easily obtainable—of the vast number of newspapers there are in the United States, and if only 381 of the entire number advocate an antiscaiping law, it certainly does not speak very well for the proposition. The articles in these papers, as shown by the clipping bureaus, were nearly all from the same pen, it having frequently occurred that the same article would appear as an editorial expression simultaneously in 40 or 50 papers.

To show how the independent press views this subject I will read you a few clippings from editorial opinions in papers representing various parts of the country from New York to San Francisco [Reading]:

[Syracuse (N. Y.) Evening News, February 2, 1897.]

Congressman Poole is being flooded with telegrams from business men in Syracuse to oppose Congressman Sherman's bill prohibiting, except under restrictions, the resale of special rate tickets over the railroads. The bill is clearly against the interests of the people, although it may have some desirable features. Congress will do well to "go slow" on this matter; it has a suspicious parentage.

[The Denver Republican, February 9, 1897.]

THE SCALPERS AND THE RAILROADS.

The action of the Senate Committee on Interstate Commerce, which yesterday decided to postpone action on the so-called antiscaiper bill, at least until the next session, ought to be a lesson to the railroad managers who were eagerly clamoring for protection from the ticket brokers. The decision of the committee is, in effect, that the railroads should come before Congress with clean hands.

They have done all they could to defeat, nullify, and overthrow the interstate-commerce law and are still evading and defeating its provisions in every way possible. They are unwilling to allow any protection to be granted to the public and still demand that they themselves be protected from the ticket brokers by an amendment to the law which they themselves condemn.

While the ticket brokerage system may be an evil in principle, it is not practically the only avenue by which the public is able to profit by the competition between the railroads. When the railroads quit conniving and abandon underhand methods there will be small need for abolishing scalping.

[The World-Herald (Omaha), February 10, 1897.]

SCALPED THE ANTISCALPERS.

The antiscalping bill has been laid to rest by the Senate, and the railroad lobby that had it in charge has turned its attention to other things. It became evident that the House would not sanction the measure when it came from the Senate, so the Senate committee quietly gave it its quietus. There never was any real reason why such a bill should be introduced into the National Legislature, and the only possible excuse for its introduction may be found in the attack made upon ticket brokers by the last report of the Interstate Commerce Commission. Had the proposed antiscalping bill become a law, it would have served to throw further restrictions around travel, and there are enough of these at the present time. A railroad ticket belongs to the purchaser, and there seems to be no good reason why he should be prohibited from selling it if he concluded not to use it or any portion of it. To prohibit him from doing this would be about as sensible as prohibiting a man from selling some furniture for which he had no use to a second-hand dealer. The antiscalping bill had its origin in a desire upon the part of passenger-traffic managers to secure a firmer hold upon the traveling public and force it to yield to the exactions of passenger pools.

[Syracuse (N. Y.) Herald, January 23, 1897.]

Representative Sherman's bill to prohibit by severe penalty the sale of railroad tickets by "scalpers" ought to be "killed." A railroad ticket, paid for at a certain rate per mile, ought to be good until it is used, no matter by whom used, if it has been fairly bought. We are glad to learn that Major Poole will vote against the bill. It is a railroad job.

[Chicago Evening Journal, February 6, 1897.]

ABOLISHING SCALPING TO PROTECT THE PUBLIC.

The Tribune has made a few mistakes in its efforts to aid in abolishing the traffic in railroad tickets. It says the Sherman bill, making the operation familiarly known as "scalping" a penitentiary offense, is in the interests of public morality, public convenience, and fair treatment. Not one of these statements is correct. The public morals have not been undermined by the liberty to buy and sell property. The public convenience has not been sacrificed; if it had been, the business would not have continued 21 hours. And certainly there is nothing unfair about being able to get your money back on a ticket when you are unable to enjoy the privilege you have purchased.

The consideration of morality is a queer point to raise in the interests of the railroads. The companies' agents have, however, succeeded in making the Baptist Young People's Society believe there is something immoral in selling property if you have bought that property from a railroad company which has an interest in extending its control over it after it has passed beyond the railroad's ownership, and the statement of the society is cited by the Tribune to show how immoral the practice is, though no account is given of how the society arrived at its conclusion.

When a railroad sells a round-trip ticket it would rather have the return portion lapse. Where the holder seeks to have it redeemed the sum of the local rates is often computed, and he is lucky if he doesn't find he really owes the company. The offer to redeem means little, and the only way to get fair treatment is to sell the unused portion of the ticket to a broker.

Extensive privileges are given railroads to secure competition between them. They accept the people's property and form pools. These pools kill competition and are unlawful. Some of the weaker lines keep the spirit of the law by violating the unlawful contract and giving large numbers of their tickets to brokers to dispose of. In this way the people get some of the advantage of the competition the pooling agreement seeks unlawfully to kill. Anything violent, or vicious, or criminal, or unlawful in this? The Sherman bill not only attempts to deprive a large number of citizens of their means of livelihood, but to cut off the public from a convenient and lawful and perfectly moral way of getting its rights from the railroad companies, which seek to withhold them. The lobby of 30 lawyers the companies sent to Washington to rush the bill through without giving the brokers a chance to present their side of the case deserves ignominious defeat.

[Addison (N. Y.) Advertiser.]

AN EVIL TENDENCY.

Legislative lunacy is an appropriate name for what is troubling some of our lawmakers. A bill lately introduced in the lower House of Congress is an illustration of that malady. The author of this measure seems to be actuated by a desire to make his name immortal.

The milk of the cocoanut is compressed in the second and third sections of the bill. The second section forbids any person, no matter what may be his condition or circumstances, from selling or in any way disposing of a railroad ticket or mileage book, except by gift, and the third section imposes a penalty of \$1,000 and imprisonment for not more than 1 year for a violation thereof.

Have railroad companies become so helpless that they need to call in the strong arm of the Congress of the United States in order to save themselves from the burden of carrying a poor man for the same price they have contracted to carry a rich man?

Such legislation, though generally couched in language intended to deceive the public as to its true intent, is but an effort to aid rich and powerful corporations to reap a reward at the expense of the common people.

The time is not far distant when those who do the bidding of the corporations and disregard the interest of their constituents, whose votes elevated them to a position of power, will meet the condemnation they so richly merit.

Public sentiment and the good sense of the majority of the present Congress may be trusted to stamp out any such measure as the one proposed.

[Toledo (Ohio) Commercial, February 8, 1897.]

Some of the railway passenger agents express little hope of the passage of antiscalping bill. The measure is one of class, directed against special interests, that should not become a law.

[Staunton (Va.) Argus, February 9, 1897.]

CHOKE OFF THIS BILL.

The people at large have not asked and do not want such a law. It was conceived and is being worked by and in the interest of the railroad companies, and the true representatives of the interests of the people should vote it down in whatever form it is presented. All classes would suffer from such a law save the wealthy. The merchant, the commercial traveler, the artisan, the laborer, and middle classes generally recognize and appreciate the saving made them through ticket brokerage. It means a day's wages to many in these tight times. A constitutional question arises here—whether declaring a chosen vocation to be illegal is not destroying a vested right.

[Daily Times-Herald (Dallas, Tex.), February 2, 1897.]

THE "RAILROAD SCALPERS" BILL.

There is a bill pending in Congress entitled "An act to regulate commerce," and which has been reported favorably by the Committee on Interstate and Foreign Commerce. The object of the bill is to prohibit the business of scalping railroad tickets and to punish the party who undertakes such business.

Outside of the question of the constitutionality of such a measure arises that of the expediency and the justice of the proposed legislation. The business of the scalpers would seem to be as legitimate as any other avocation. It is true that round-trip tickets, mileage tickets, excursion tickets, and the like are sold by the railway companies at a discount under certain conditions, but to make the purchaser and the seller of the unused transportation guilty of a crime is not only going too far, but would be shamefully oppressive and outrageously violative of justice. The baker, the butcher, the grocer, the restaurateur, and other people and firms and corporate bodies do frequently issue return tickets, coupons, etc. They have and set a price upon their property thus sold in lump; they receive the spot cash for the same, while the purchaser takes all the chances of loss, in its manifold ways. It is a neutrality of contract in one sense, and yet it is in many respects a one-sided affair for the very reason that the buyer never gets value received unless and until all those chances have been removed by the possession or use of the property. In the matter of travel the buyer of transportation assumes numberless risks. Now, to at all equalize the matter, it is but right that the seller, that the railway company, in the special subject now under review, should honor this obligation to furnish that which was bought and paid for, whenever presented. A bank note goes out upon the world, and if A presents the one-half of it and B the identified other one-half, each should receive the quantum due to each. And so with a transportation ticket, if A uses it to a certain extent, to one point, B should in all justice be allowed to use it for returning.

From another point of view, the convenience and the saving to thousands of travelers on whom it is incumbent to economize every dime, is a matter that deserves consideration. The richer classes and the favored ones can better afford to expend more, and buy at first hands if they choose, but to the poorer these cut rates are boons, while to those who sell there is just that much saved.

And yet, in view of all these things, it is proposed that the great National Congress, supposed to represent the people, should indulge in such legislation as to make a citizen guilty of a crime with penitentiary punishment simply because he sells or buys an unused transportation ticket. It would seem that where the companies receive their quid pro quo in advance and have fully protected themselves, the legislation should rather be for the protection of the feeble individual in getting back, in some shape, what he has paid for, since he, at least, has obtained nothing under false promises.

There are articles of a similar nature, many of them very strong, from the Piqua, Ohio, Morning Dispatch; Meadville, Pa., Messenger; Chicago Evening Journal; Kansas City Star; Syracuse, N. Y., Evening Herald; Salt Lake City Tribune; Arkansas Gazette; Charleston, S. C., Post; Grand Junction, Colo., Daily Sentinel; Detroit Evening News; Grand Rapids, Mich., Herald; Buffalo Evening News; Youngstown, Ohio, News; Dallas, Tex., Herald-Times; Memphis Commercial Appeal; Hagerstown, Md., Morning Herald; White River Junction, Vt., Landmark; Louisville, Ky., Courier-Journal; Omaha World-Herald; Chattanooga Times; Duluth Evening Herald; Duluth News Tribune; Cleveland Plain Dealer; Denver Republican; Wheeling Register; Sioux City Journal; Richmond State; Cleveland Leader; Roanoke, Va., Times; Baltimore Morning Herald; New York World; St. Louis Star, and from other newspapers all over the country. I will simply file the printed copy, because I would weary the commission by the repetition of these ideas.

Perhaps the strongest factor the advocates of the antiscalping laws have had to contend with is the intense opposition to laws of this character evidenced by the great masses of the people and especially by societies of organized labor.

I have here a pamphlet published in 1898, when this subject was under discussion in Congress, giving the protests from legislatures, traveling men's societies, and, I might say, almost every labor organization in the United States, with the single exception of the distinctively railroad organizations. I recall a conversation with the president of one of the great railway labor organizations. I happened to meet him by accident. I said to him. Why did your people pass that resolution asking Congress to pass the antiscalping bill? He colored and said:

"Well, the conductors asked us to do it." After some little conversation he brought his fist down upon my counter and said: "When I buy a railroad ticket, that ticket is mine and I have got a right to do what I please with it."

And although these railroad organizations have passed resolutions of that kind, I do not believe there is a single individual member, who has given the subject any thought, who does not believe that when he buys any railroad ticket he has a right to do what he pleases with it.

Q. (By Mr. Kennedy.) What are the names of the labor organizations?—A. I will give you some specially. The American Federation of Labor, with a membership of very nearly a million at the present time, I think—they claim to represent 2,000,000—have at their four last annual conventions condemned this bill in every shape. I will give you a specimen. Two years ago in Detroit the American Federation of Labor passed the following resolution [Reading]:

Whereas one of the first bills introduced in the present, the Fifty-fourth, Congress is a measure known as an "antiscauping" bill, the provisions of which make it a crime punishable by heavy fine and imprisonment for any person other than an agent authorized by a transportation company to sell a passage ticket, or for any person to buy a ticket except from such agent; and

Whereas bills of similar character have been before Congress nearly every session for the past 10 years, urged solely by the great trusts and illegal traffic associations and kindred interests, and have failed of final passage because of the fact that in the United States Senate and House of Representatives there are still many staunch champions of right who have listened to the unanimous protest of organized labor and fought loyally for the liberty and property rights of the common people; Therefore be it

Resolved, That the American Federation of Labor, in this its nineteenth annual convention assembled, hereby reaffirms the resolutions of the seventeenth and eighteenth conventions denouncing "antiscauping" legislation, and we now call upon all United States Senators and members of Congress who place the rights and best interests of the great masses of the people before that of trusts, corporations, and monopolies to bury this monstrous bill, and others of like character, in an oblivion so deep that there will be for it hereafter no resurrection.

At the last meeting of the federation, in Louisville, in December, 1900, the following resolution was adopted. This is a certificate from the secretary [reading]:

WASHINGTON, D. C., January 18, 1901

To whom it may concern

This is to certify that at the twentieth annual convention of the American Federation of Labor the following preamble and resolutions were unanimously adopted:

Whereas the so-called "antiscauping" bill, which has been denounced by resolutions in the three last annual conventions of this organization, is before the Committee on Foreign and Interstate Commerce of both Houses of Congress. Therefore be it

Resolved, That the American Federation of Labor, in this its twentieth annual session assembled, again declares unalterable opposition to the letter and spirit of this bill.

Resolved, That the members of our legislative committee be, and are hereby, instructed to oppose, by all honorable means, the passage by Congress of this bill, or any other bill embodying the same principles.

FRANK MORRISON, *Secretary A. F. of L.*

The general assembly of the Knights of Labor that met in Birmingham, Ala., November 13-17, 1900, adopted the following resolution [reading]:

Whereas the so-called antiscauping bill was introduced into both Houses in the present session of this, the Fifty-sixth, Congress, and

Whereas this bill proposes to make criminal and punish by heavy fine and imprisonment the act of selling a railway ticket unless the party so selling has written authority from a corporation controlling railways; and

Whereas the provisions of this bill would convert an innocent act into a new crime or take from the citizen his liberty and rights of property guaranteed under the Constitution, invest corporations with a sovereign and oppressive power, strip the State of jurisdiction, and confer it upon the Federal courts. Therefore be it

Resolved, That the order of the Knights of Labor in general convention assembled denounces this bill as a strictly corporation measure, designed to throttle competition, make easy the maintenance of pool and illegal traffic associations and combinations, and to force those who pay railway fares to submit to the prices fixed by these trusts.

Resolved, That we hereby enter an earnest and emphatic protest against the passage of this bill or any other measure embodying the same principles, and urge all members of Congress who desire to truly represent the people to use their best efforts to prevent a measure so antagonistic to all right and justice from becoming a law.

Resolved, That the secretary be, and is hereby, instructed to mail a copy of these resolutions to each member of Congress.

The National Building Trades Council of America, in convention at Milwaukee, passed the following resolutions January 12, 1900 [reading]:

To whom it may concern

The following is a copy of the preamble and resolutions passed by a unanimous vote of the National Building Trades Council of America January 12, while assembled in annual convention at Milwaukee, Wis.

Whereas there has been introduced by Senator Gear, of Iowa, in the United States Senate, and Congressman Sherman, of New York, in the House of Representatives, measures known as "antiscauping" bills; and

Whereas the purpose of these bills is to abolish, through the Federal courts, the business of offices selling railway passage tickets at reduced rates, and force upon all who travel and pay their fare the rates fixed by illegal pools and traffic associations; and

Whereas these bills provide a heavy fine and imprisonment for any person to sell a railway ticket unless he has a certificate of authority from a transportation company, thus conferring upon corporations a sovereign power: Therefore, be it

Resolved, That the National Building Trades Council, in this its annual convention assembled, declare these bills to be trust measures of the most offensive character; that it is class legislation, and a dangerous menace to the liberty of American citizens and to individual property rights.

Resolved, That we request all labor organizations and kindred interests to unite with us in urging upon Congress the intense opposition to this obnoxious trust measure felt by the wage-earners of America.

Resolved, That the secretary be, and he is hereby, instructed to mail a copy of these resolutions to each member of this the Fifty-sixth Congress.

Respectfully submitted.

H. W. STEINBISS, *General Secretary-Treasurer*.

The printers and, in fact, all of the great labor organizations of this country have adopted similar resolutions.

Now I wish to refer to matters and statements that have been made before this commission. In looking over the testimony of several distinguished railroad men who have appeared and testified, I find the only case where anything like specific charges against the practice of ticket brokerage have been made is in the testimony of Mr. Blanchard. I will try to reply to these charges in the same order in which they appear in the printed proceedings.

As to the statement that the laws of 10 States prohibit ticket brokerage, it is sufficient to reply that in 36 States the legislatures have refused to pass similar laws, that in 2 of the 10 States where such laws have been passed the highest courts of the States have declared the acts unconstitutional, and that in the 8 States where the law exists it is inoperative. As to the fact that a law exists in Canada prohibiting ticket brokerage, I will say that at the time this law went into effect there were but 3 brokers in the Dominion, 2 in Toronto and 1 in Montreal. No resistance could be organized to show the case from the standpoint of the broker. But at that time and for many years after the Canadian roads openly paid commissions to brokers in the United States and it is probable they are doing so today. The traffic in tickets by individual passengers and by hotel clerks is common. I have never heard of a prosecution under the law.

The advocates of an "antiscalping" law have laid great stress upon the recommendation of the Interstate Commerce Commission, in December, 1896, that a law be enacted prohibiting the sale of interstate passage tickets except by authorized agents of the railways. That was 4 years ago. Three annual reports have since been filed by that commission. All the principal subjects relating to transportation have been exhaustively treated in these reports, except that of ticket brokerage. This omission appears very significant. It is not the result of accident or oversight. The commission has chosen to ignore the subject. Is it not probable that a closer acquaintance with the objects and methods of those who are so loudly calling for the scalp of the broker has taught them the error of their earlier judgment, and convinced them that the power an antiscalping law would place in the hands of the managers of the great pools and traffic associations could be, and would be used to the detriment of the people?

Mr. Blanchard says in his testimony that the best moral sense of all the commercial world is against the business of ticket brokerage. To give the commission an idea of how the "best moral sense of the great commercial world" was secured, I call your attention to the following circular, which was sent out from this city by a committee employed to urge upon Congress the passage of the so-called "antiscalping" bill during the session of 1897-98 [reading]:

"ANTISCALPING BILL. HEADQUARTERS, SHOREHAM HOTEL,
"Washington, D. C., December 10, 1897.

"MR. L. P. FARMER,

"Commissioner, 145 Liberty street, New York.

"MR. N. E. WEEKS,

"Chairman N. E. Passenger Association, Boston, Mass.

"MR. F. C. DONALD,

"Commissioner, Central Passenger Association, Chicago.

"MR. B. D. CALDWELL,

"Chairman Western Passenger Association, Chicago.

"W. W. KENT,

"Chairman, 723 Security Building, St. Louis.

"JOSEPH RICHARDSON,

"Chairman S. E. Passenger Association, Atlanta, Ga.

"GENTLEMEN: The House Committee on Interstate Commerce will give a hearing on the antiscalping bill on Friday, December 17. This committee consists of 17 members, 8 of whom, viz, Hepburn, Fletcher, Sherman, Wanger, Joy, Corliss, Bennett, and Stewart, served in the Fifty-fourth Congress and were favorable to

our measure. The other 9 members, viz, Simpkins, Davy, Henrichsen, Adamson, Barham, Hawley, Mann, McAleer, and Davis, are new members who have as yet been untried, and on these latter-named gentlemen it is absolutely necessary that all possible influence be brought to bear by telegrams or letters before the date of meeting to secure their favorable cooperation in passing the bill favorably from the committee to the House calendar. Can I therefore suggest that you will promulgate this information to each and every member of your association, in order that they may take immediate action?

"I would also request that correspondence be opened at once with the president or secretary of each and every society, organization, etc., requesting reduced rates for conventions and meetings, with a view that you secure the aid of said organizations in passing favorable resolutions, addressed to Senator Cullom and Representative Hepburn, and also for individual letters from prominent members of said organizations, addressed to their respective Senators and Representatives, and, so far as possible, keep this office advised of action taken.

"The enemy are sending in petitions from minor labor organizations and letters from country merchants and various persons in opposition to the bill."

(I know in Michigan we had everyone—the legislature and the governor, every commercial organization in the city of Detroit, the mayor and city council, the board of trade, the merchants and manufacturers' exchange, all of the banks, and all of the commercial-traveling and labor organizations—protesting against this bill. I do not know whether they would resent the imputation that they were country merchants or not.)

[Reading:] "After action on the 17th it may be necessary to again organize throughout the country for an aggressive campaign in securing petitions in every town along the lines of railways.

"Should this plan be adopted, and I hope it will, it would be wise to have each local agent instructed to secure at the head of each petition the name of the most prominent man in his town, inasmuch as the Congressional Record reprints the petition, as follows: 'Petition from John Brown and 25 other citizens of ——— town.' You will understand by this that the leading man should be one of influence, in order to command attention. The agent should also be instructed to totalize the number of names on each petition and forward a postal card to this bureau, stating as follows: 'Petitions of John Brown and ——— others forwarded to Senator ——— and Representative ——— this ——— date.' This is essential, inasmuch as we propose watching the Record, and if within a reasonable time the petition is not shown in the Record we will undertake to follow it up by a personal canvass and secure its recognition.

"This work is most useful, as from time to time we are enabled to show the chairman of the committee in the House and in the Senate, or the Senator or Member in immediate charge of the bill, the totalization of people who are in favor of the measure."

(This shows the methods by which the petitions in favor of the passage of that bill were obtained. An agent of a railroad company in a country town, probably the most important man in the town, had instructions to obtain these signatures and he got them; his job depended upon it.)

[Reading:] "The cooperation of the clergy is essential, provided they largely dwell upon the fraudulent character of the ticket-scalping business; also from leading merchants, manufacturers, editors, and other influential citizens.

"If we could receive copies of letters from the most influential clergymen and merchants for publication in circular form it would be most beneficial.

"The scalpers are here in force and are systematically organizing a strong opposition."

(The force of the "scalpers" consisted of two men, representative ticket brokers. One was from Chicago and one from St. Louis. They were here simply to present the case before the committees of Congress and to explain the business of ticket brokerage, of course, to any members who might be willing to listen to them.)

[Reading:] "I trust that all members of your associations will not overlook the fact that unless the bill is passed in both Houses this session it will be, in our opinion, almost impossible to secure favorable action for some years. After the close of this session the members then commence a strong canvass for reelection, and unless the feeling is overwhelmingly expressed in our favor they will be lukewarm in order to avoid criticism from the opponents of the measure in their respective districts."

(It cost votes, and, as I explained in my testimony before, the two notable attempts that have been made to pass this bill were sprung directly after an election. A Congressman then had two years before him anyway, and his constituents would probably forget all about it before the next election.)

[Reading:] "We would also respectfully request that all general passenger agents, in addition to the instructions given to local agents, will thoroughly canvass the matter with the traveling passenger agents to promulgate this measure throughout the country, securing whatever aid they can with business people generally, and also to closely work up the matter with local agents.

"In order to thoroughly acquaint the traveling passenger agents with the bill, principles of same, etc., we would suggest that each general passenger agent call his force together and advise them fully upon the necessity of careful and efficient work.

"At some length we have outlined the general work required, feeling assured of the hearty cooperation of all officials of the railroads throughout the United States.

"Very truly, yours,

"M. C. ROACH,
"JAS. V. MAHONEY,
"Bureau Com."

Mr. Blanchard makes reference to the business of stock and merchandise brokers, that they deal only with principals, and that ticket brokers are independent, and therefore there is no means of regulating them, etc. I reply: While stock and merchandise brokers may originally deal with principals, do these agents retain control over the commodities they handle after receiving the price? Railroad tickets are first purchased, of course, through authorized sources; but the advocates of the antiscaoping bill would try to still retain control over that property after it passes from their hands.

He says further: In order to sell cheaper, the brokers must get the tickets cheaper, and therefore it is a violation of law, because railroads are compelled to file their rates. This argument carries with it the proposition that the acts of traffic associations must have the sanction of law.

It is well understood that the rate-making power has been taken out of the hands of the officers of individual roads. A railroad may not even run an excursion without the consent of the passenger association of which it is compelled to be a member.

Therefore, according to his logic, when a rate is made, that is the law. The man who cuts that rate is a violator of the law. "The king can do no wrong," and we should meekly bow to the dictates of rate-making associations.

He says again that "every dollar they realize belongs to some railway company or passenger who has been wronged to that extent."

After having received its price, how can a railway be wronged? And how can a passenger be wronged who voluntarily sells his ticket to a broker, and, as an almost invariable rule, receiving more for it than the redemption bureau would allow him?

The method of redemption is to deduct for the part of a ticket used the regular local fare and return to the passenger whatever difference there may be. I will get to that later, showing what value the redemption bureau would be ordinarily to a passenger who has a ticket he can not use.

Mr. Blanchard says (Report of the Industrial Commission, Vol. IV, p. 622) [reading]:

"Proceeding from these foundation principles, we oppose scaoping:

"(a) Because its cessation means the stoppage of many secret, fraudulent, and illegal practices, which create undue, unreasonable, and unauthorized discriminations in the passenger fares duly made, published, posted, and filed according to law."

I reply that the cessation of ticket brokerage means the destruction of competition. The broker in some degree prevents discrimination by the very publicity of his business. Discriminations are going on constantly in the offices of railways. Social and political debts are paid by passes and special-rate tickets. Shippers and men of influence are hourly favored. Holders of tickets upon which limits have expired, if they have influence sufficient, can get an extension of time. The ordinary passenger, not enjoying these special privileges, has to submit to the regular rules, except for the relief secured through the offices of ticket brokers.

Mr. Blanchard further says [reading]: "(b) Because resold tickets cut the local fares from the points where they are sold, and thereby produce fares and differences in fares not intended or authorized by the railroads and forbidden by law. To that extent they create unjustifiable preferences between persons, localities, and also to trade bodies, conventions, and other associations moving in large numbers, by extending the reduced fares granted to such bodies to persons not entitled to receive or use them."

Is this not a distinct advantage to the public? After receiving its price, can the railway be improperly injured? The law requires that excursion rates shall be available to the general public. After selling tickets and providing accommoda-

tions, the railway can not be injured by A riding on the ticket sold to B. As a matter of fact, round-trip tickets are never questioned on the going trip. It is only the return parts of tickets that railroads try to repudiate.

I have in mind a case that I noticed particularly on an overland trip to California—on the return trip. The ticket collector on the train came to me in great glee and said, "I have just made \$15; I have caught 3 'scalps.'" "What were they?" "Why," explained the collector, "there are 3 passengers on this train that have tickets that I refused to honor and have taken up, and I get \$5 apiece for such tickets." "What was the matter with them; were they fraudulent?" "Oh, no; but they had not been properly executed, or something of that kind, and, according to the contract, the company does not have to accept them."

I looked up the cases, and I found that in every case the tickets had been properly purchased; at least the full fare of the round-trip tourist rate had been given. One case in particular I remember. A young man with his sister had gone from Minneapolis to California, purchasing 2 round-trip tickets, 6 months' tickets, and the lady had signed the 2 tickets. The name I have forgotten. Going, the tickets were not questioned. On the return journey it was necessary for the lady to return first. She went to the proper office and signed her name to both the tickets, as she had done when purchasing them originally, and they were stamped by the agent. When, a few days later, the brother took the train, his ticket was refused, no excuse would go, and his ticket was confiscated and he was compelled to pay the local fares from point to point, and local fares West are very high. He was not instructed how to get his money. I told him (when he got to his destination, if he had money enough) how to apply for a refund. In that way the company received twice the fare.

Mr. Blanchard said [reading]: "(c) Because the closing of unauthorized brokers' offices would doubtless stop the inducements now existing to steal, alter, forge, counterfeit, or plug tickets, or issue tickets bearing fictitious indorsements as to extensions of time, and would also curb or prevent the sales of passes, advertising, editorial, and mileage tickets by sellers, buyers, and reissuers. It is also to be emphasized that it would substitute authorized and accurate information to the traveler, for the false representations now constantly made by brokers in order to sell their tickets, in respect of routes, time, change of cars, sleeping cars, checking of baggage, connections, etc. Recent tests show the great extent to which this misrepresentation still exists.

"I would like to say, in connection with this subject, that the ticket offices of the scalpers in New York were visited recently, and in nearly all of those visited untrue or misleading representations were made in some regard as to connections, time, or some other fact in connection with the actual facilities of travel."

There are laws in every State against stealing and forging. If the laws we have are not considered sufficiently stringent to correct such abuses, we make no objection to the enacting of the most stringent laws upon this subject.

I have already shown that our association has a standing offer of reward for the arrest and conviction of parties guilty of this particular variety of crime.

As to the authorized and accurate information, the ticket broker is often better qualified and is more disinterested in giving accurate information than the authorized agents of rival lines.

The confidence and good will of his patrons are very essential to his success. He must be obliging and truthful as a matter of business.

It is a very common experience in the offices of brokers to have travelers who are already equipped with tickets ask for information, claiming that the regular agent was either too busy or too indifferent to give them attention.

In the commission's report of the testimony of Mr. Blanchard the following occurs [reading]: "Q. (By Professor Johnson.) How could you get at such information?—A. By sending persons to the scalpers' offices to ask if such and such lines made certain connections, or did this or that; would such and such tickets be accepted on certain trains, etc.; the time of trains, number of times transfers took place, and information of that general kind.

"Q. And you know from sending for that information?—A. Yes."

This reference by Mr. Blanchard to the spotter opens up a subject upon which volumes could be written. He is the useful tool of the rate-making powers and the traffic pools. A fair idea of his methods and the way that professional liars are made of people who would prefer to be honest may be gained from the following article, clipped from the Chicago Daily News of June 7, 1900 [reading]:

ON THE SCALPERS' TRAIL—HOW THE BIG PASSENGER ASSOCIATIONS RUN DOWN ILLEGAL TRAFFIC IN RAILWAY TICKETS—MEN AND WOMEN "SPOTTERS"—A NOVEL KIND OF DETECTIVE WORK.

Old and new methods: In years gone by each individual railroad company, when it thought the general passenger agent of another line was manipulating the market through some friendly scalper, used to coast about in a dilatory sort of way and find out what he could, and then sharp letters would fly back and forth making accusations against competitors, and there the affair would end. Now all

this is changed, and the change was brought about by the growth of the passenger associations, two of which, the largest in the country, have their headquarters in Chicago. One of these is the Western Passenger Association, which is made up of all the lines running west from Chicago and governing also the roads reaching to the Southwest and Northwest. The other is the Central Passenger Association, which controls the doings of the Eastern trunk lines and also those reaching to the Ohio River. Keeping tab on the "market." To these organizations, during the past 3 years, have been relegated the duties of keeping tab on the "market," as the scalpers are designated. Each year the chairmen of these two associations have put into effect more expert methods of spying out the conditions as regards the abuse of railway tickets and passes, until the brokers now freely admit that the system of espionage is so strict that it very seriously handicaps their business and subjects them to a large loss annually.

Not only does this system of "testing the market" apply to Chicago. It is so extensive that it includes all other cities and towns of any importance where scalpers thrive, and such cities as Omaha, Denver, Kansas City, St. Paul, and Minneapolis, St. Louis, Cincinnati, and all places where conventions of any importance are held, are as closely watched under the direction of the head of the passenger association as is Clark street in Chicago, the hotbed of all ticket brokers.

The "spotters" employed for making the tests are usually men furnished by some one of the private detective agencies, and oftentimes special details of women are asked for.

When the agents are not from a detective agency, some of the clerks, young men and women employed in the mileage bureaus of the associations, are sent out on the street and are initiated into the business unless they make decided objection to the work.

Such tickets as are picked up by the operators are turned into the association's office, and then the chairman proceeds to notify the roads by which they were issued that a certain ticket of a certain kind has been found in the street, and the road is requested to remit for its full tariff value. This is in the cases of editorial and half-rate transportation. In the case of passes, immense numbers of which get into the hands of the brokers, the parties or concerns to whom they were given are simply placed on the so-called "confidential list," which means that further courtesies will not be extended.

As regards free transportation by the scalpers, it is said that only a certain class of the brokers will handle this business, the more reputable ones refusing to have anything to do with it.

* * * * *

"Spotters move from city to city." When the operators have become too well known to continue their work in one field, they are shipped to another city, and the testing of the street is taken up there. En route they are used as so many "spotters" on the train conductors, the passenger associations also keeping in touch with the transportation that is handled by conductors on trains.

A feature of this testing the market which perhaps is not generally known to the public, and which hits the brokers the hardest, is the lifting of the mileage tickets. All such tickets bought up on the market are confiscated by the two passenger associations, and in a year's time it means an immense financial loss to the brokers, who are just so much out of pocket. When very severe tests of the market are being made, the associations oftentimes get outsiders, in the guise of traveling men, to help, and in this manner much mileage is secured from the scalpers which otherwise they would not let go, because of their fear of the "spotters."

This innovation of recent years put into effect by the railroads has practically clipped the wings of the broker element and has had the effect of driving many of them out of the business."

This shows a method that is in vogue with some of the more unscrupulous roads. It is but fair to say that there are railroads or managers of railroads who are opposed to us from a business standpoint, who are too honorable to stoop to such methods. But with the unscrupulous the ticket broker is helpless. He puts out a mileage book and has to guarantee it to the passenger; the man may be a spotter, and come back with a receipt—ticket taken up by the conductor—all lost, and the value must necessarily be refunded; and this article says it goes into the treasury of the great traffic association and causes annually a great loss to the ticket broker.

Mr. Blanchard says [reading]: "(d) Because scalpers have induced some conductors not to cancel tickets taken up, in order that they may resell them in their scalping offices—and sometimes more than once—for their joint benefit."

In an experience of 19 years I have personally known of but three or four cases of this kind and I had the satisfaction of reporting them to the railroads interested.

Mr. Blanchard says [reading]: "(e) Because they have corrupted clerks and ticket distributors in some railway general offices by inducing them to purloin and dispose of irregularly issued tickets for a consideration."

Such things have no doubt occurred, but if common among brokers the spotter system of railways would soon unearth the scandal. I have seen no evidence that such customs are at all prevalent in all the information laid before legislative bodies during the past 10 years.

In that connection I want to call your attention to a specimen of the sort of argument that is used against ticket brokers. In this little pamphlet entitled Museum of Ticket Scalping Iniquity, are shown tickets that were some of them issued 10 years ago; photographs of the tickets showing the methods by which they were used—by which changes were made, tickets plugged, etc. In all this alleged evidence there is but one single case where a direct charge is made against a broker; but it says "a scalper did so and so;" "this was done by a broker." There is only one case, as I remember, where a name is mentioned, and in that case the man was exonerated by the courts.

This pamphlet came out about two years ago, and was issued by the central antiscalping committee, of Chicago. Quite recently an exact counterpart of the greater part of this pamphlet, this time purporting to be issued by the National Association of Merchants and Travelers of Chicago, has appeared.

It seems to me a singular thing that men as shrewd as the passenger agents and managers of railways should try to use this sort of thing as evidence before a body of men of as high intelligence as United States Senators and members of the House of Representatives, when the pretended evidence would not convict any one of wrongdoing before a country justice of the peace. Of course I can not say that none of these specimens were used by a ticket broker, but I know something of the class of men that are employed by railroads to get evidence, and I know that these men are entirely capable of making evidence if they can not get it by any other means.

This is a specimen of the class of charges that are brought against ticket brokers. Now, in trying to combat these false representations, we are absolutely helpless. Statements will be published in the newspapers that such and such a person was defrauded by a "scalper;" his ticket was no good. The name of no broker is used, and there is no chance for a libel suit. A year ago in St. Louis a newspaper came out with a very scathing article against ticket brokers, calling them rogues and thieves. Two or three ticket brokers in that city brought suits for damages for libel, but they were thrown out of court because the charge was general—no particular person had been mentioned. We have to suffer that sort of persecution and are helpless.

Mr. Blanchard says [reading]: "(f) Because many scalpers operate in clear violation of law, notably in 10 States wherein they nullify the statutes thereof."

This has been replied to before. It may be well to refer to recent cases in the city of Philadelphia where 4 hotel clerks were fined \$200 each for handling railroad tickets. Of all the cities in this great Union Philadelphia is the only one where a citizen can be fined in court and rest under the fear of imprisonment for the sale of a railway ticket. I know nothing of the merits of these cases, but from published reports the only offense committed by these young men was that of disposing of tickets handed them by guests of their hotel, the transactions being greatly similar to the transaction illustrated to this commission by President Stickney when he sold his ticket to Big John in the Grand Pacific Hotel in Chicago.

Mr. Blanchard says [reading]: "(g) Because many scalping offices are in the nature of fences or pawnshops, both of which latter are subject to legal or police regulations and examinations, while scalpers' offices, being used for similar purposes in another commodity escape such safeguards against misuse and fraud."

In many of the cities of this country ticket brokers are licensed. This license has often been solicited and secured by brokers, who by this means have sought to keep out undesirable characters.

Mr. Blanchard says [reading]: "(h) Because the railroad companies are held responsible for disturbing passenger conditions, which they disapprove, and which they ask the aid of law to effectually resist and prevent."

If railroads contend that ticket brokers are responsible for disturbing passenger conditions, how do they account for disturbed conditions in freight traffic where brokers do not operate?

Mr. Blanchard says [reading]: "(i) Because scalpers incite railroad wars and reprisals as the best means by which they can procure the greatest number of tickets at the lowest cost, and by shifting their business from one road to another and by working in conjunction with other unauthorized or pliable agencies, they have frequently produced the serious contentions in fares which they desired."

The rate wars of Canada refute the statement that brokers are responsible for rate wars. But if rate wars are undesirable, a law could be enacted forbidding them.

Mr. Blanchard says [reading]: "(k) Because when a railway company decides to secretly reduce one or more classes of through fares, it dares not do it in its own offices in violation of the interstate act, of various State statutes, and of the several tariffs which it has published, filed, and posted pursuant thereto, but usually avails of ticket scalpers' offices to collusively violate the act, a course which involves better intending lines in a demoralized scramble for business. I do not mean that this practice is now even considerably resorted to by the railroads. It has been gradually circumscribed, but if scalping offices were altogether abolished, or their authority required to be made legal, it would tend to the entire cessation of these joint resources and practices."

The ticket broker offers to-day the only means by which the traveling public may escape the autocratic rule of the great traffic associations. Abolish him and exactions would be practiced from which there would be no relief, at least not within the means of the poor and uninformed.

Mr. Blanchard says [reading]: "(l) Because scalpers afford no honest information or accommodations to travelers which the railroad companies do not desire

to extend to all their patrons under just and uniform charges and rules, administered through their authorized bureaus of information and redemption, where they will return to the holders of unused portions of tickets all amounts exceeding the fares which duly accrue between the points which the passenger actually traverses, correct errors of their agents in selling tickets as to routes, the erroneous checking or losses of baggage, etc. Even the scalpers must send their patrons to such offices for those purposes or substitute a show of authority made up often of fraud, ignorance, collusion, dishonesty, and depleted and unequal fares. The railroad ticket agents at all points will transmit unused coupons to the redemption bureaus and give all desired information."

In this the gentleman is wholly at fault. As before explained, an element necessary to the success of a broker is the confidence and good will of his patrons. As to the matter of redemption, I will answer that a little later.

I think I might, perhaps, illustrate the value of the broker in saving the passenger from loss through the undue exactions and iron-clad rules of railroads by a case that occurred recently in my own experience. A young man came into the office with the return part of a ticket to Duluth, Minn. The fare is \$19.25. He asked me what I would pay for it. I inquired of him if he was going back. He said: "Yes; but I want to stop at Saginaw, 100 miles north, and the agent here in the city told me I could not stop on the ticket." I instructed him to go to the district passenger agent and ask for an instruction to the agent at Saginaw to stamp the ticket when he was ready to go on. I advised him that he could pay the local fare, \$2.91, to Saginaw, and in that way he would save his ticket. The ticket had been sold on account of some teachers' convention, and was good until the 9th of January. It had cost him the ordinary rate plus \$2. That would be \$21.25. The young man came back to the office in a little while and said the passenger agent insisted that the conditions on that ticket could not be waived; that he would be obliged to either return to Detroit to have his ticket executed for the return journey or give up the stop at Saginaw. I told him to leave the ticket at my office, and in case I got a passenger to Duluth I would send for him and he could go and have the ticket stamped and executed by the agent so my customer could use it, and when he got ready to go himself he could pay the company the local fare. He did so. I realized \$15 for his ticket. I guaranteed this ticket to the passenger, who took it, and as I have not heard from him no doubt he made his journey safely. The original owner of the ticket paid regular fare to the same company when he was ready to go. In that transaction it seems to me a ticket broker saved the passenger from a loss that practically amounted to the confiscation of his ticket and in no way defrauded the railroad company. That is simply an illustration of what is going on every day and every hour all over the United States.

There is another subject that may be pertinent in this connection. Some time in the latter part of 1898 an edict went forth by the railroads cutting off second-class rates generally through the southwest. No corresponding reduction was made on the first-class rate. The lowest rate prior to January 1, 1899, between New Orleans and Louisville was \$13.50; the lowest present rate, \$10. I will just pick out a few of these; there is a long list of them: The lowest rate, New Orleans to Kansas City, old rate \$20, present rate \$24.35; Chicago to Austin, Tex., former rate \$23.75, present rate \$32.15; Washington to Waco, Tex., former rate \$30.30, present rate \$38.30.

Q. (By Mr. FARQUHAR.) Are those first-class rates you are now reading?—A. These are the first-class rates at present, and the only rates.

Q. The old first-class rates and the present?—A. The old second-class and the present first-class. The first-class rates have not been changed, but the second-class rate has been abolished.

Q. (By Mr. LITCHMAN.) The lowest sum you mention is the second-class rate?—A. It is the old second-class rate. There is none to-day. There was an average difference, I think, of 40 per cent. This order was sent out by the commissioner; and, perhaps through oversight, it was not filed with the Interstate Commerce Commission; but I do not care to discuss that part of the subject. It was only through brokers that the people who wished to travel cheaply could get any relief.

This condition continued until 4 days ago. I received a wire dated January 14, 1901, from New Orleans, as follows: "Owing to heavy brokers' competition railroads yesterday put on sale second-class tickets to Chicago, St. Louis, Kansas City, sixteen fifty, twelve fifty, fifteen fifty, a reduction about fifty per cent." And by letter of same date: "Am glad to inform you that the railroad companies out of N. O., owing to the brokers selling so many second-class passengers to Northern points via round-about routes and at reduced rates, have been compelled to reduce their second-class rates to Northern points as follows: Former rate to

Chicago, \$23, now rates for second-class passengers are \$16.50; St. Louis, reduced from \$18 to \$12.50; Kansas City, from \$24.35 to \$15.50. In addition they have been compelled to place on sale at reduced rates party tickets to various Northern points. These reduced rates went into effect yesterday, Jan. 13th."

This I simply use as an illustration of the fact that ticket brokers are an advantage to the public, frequently bringing about reductions in railroad rates.

(After a recess of one hour the commission resumed the hearing of Mr. Lindenberger, as follows:)

The WITNESS. In speaking of this order taking off the second-class rate South I omitted to speak of the circular that was sent out by Mr. Joseph Richardson, chairman of the Central Passenger Association. I would like to submit it and allow it to go into the evidence in the proper place. The order was as follows:

[Central Passenger Association, office of the commissioner, eighth floor Monadnock Building, F. C. Donald, commissioner. Gerrit Fort, secretary.]

CHICAGO, ILL., December 22, 1898.

[Circular Letter No. 1090.]

To the Members of the Central Passenger Association

DEAR SIR: The subjoined communication is respectfully submitted for your information

Yours, truly,

F. C. DONALD, Commissioner.

[File 3796.]

SOUTHEASTERN PASSENGER ASSOCIATION,
Atlanta, December 19, 1898.

STANDARD RATES—WITHDRAWAL SECOND-CLASS FARES.

B. D. CALDWELL, Esq., Chairman.

DEAR SIR: Replying to yours of December 16, we beg to state that at a meeting of the representatives of southeastern lines, held at Cincinnati, December 15 and 16, it was arranged to cancel all second-class fares from this territory to Buffalo, Chicago, Council Bluffs, St. Louis, Kansas City, Deming, and intermediate points, as well as to points lying thereon, to take effect at the earliest date possible. This will only have in effect second-class fares from the southeast to eastern cities and Virginia points to Montana and Pacific coast points, and to points in Mexico; also to a few points beyond St. Paul, lying thereon. Second class fares between the South and Virginia cities, including Washington, D. C., may possibly be withdrawn later on, as this subject is listed for consideration at next meeting of the conference committee of this association.

Very respectfully,

JOSEPH RICHARDSON, Chairman.

(Copy to F. C. Donald, esq.)

I made an illustration of the redemption value of a Duluth ticket and explained how the broker came to the relief of the passenger. There is another oppressive rule practiced by most of the railroads. Notwithstanding the fact that a limited ticket may be good to stop at certain points—junction points and ends of coupons—there is a rule that baggage can only be checked to the destination of the ticket. For instance, if a passenger in New York buys a Chicago ticket, while his ticket may permit of his stopping at Detroit, they will not check his baggage to Detroit but will check it through to Chicago. I have known of cases where a passenger had occasion to stop at Detroit and wanted his baggage. The railroad company refused to deliver it up, and in order to get it the passenger was compelled to pay the excess rate from Chicago to Detroit the same as though the baggage had been carried to Chicago by the railroad company and then transported back again. The excess rate, being about 13 per cent of the regular passenger fare, amounts to about \$1 per 100 pounds. I have known passengers to be mulcted out of \$1 or \$2 just to get their baggage. In some cases the companies have required the surrender of the balance of the ticket—take it away from the passenger before they would give him his baggage. I have known that to be done. For instance, in California at all eastern points you can get a ticket to Los Angeles via San Francisco, or to San Francisco via Los Angeles at the same price as to go to either point direct. A passenger with baggage checked to Frisco may want to discontinue his journey and get his baggage at Los Angeles. The company confiscates the ticket, although they may not have carried the baggage or the passenger 1 mile, and are paid their proportion of the through rate by the company issuing the ticket. The fare from Los Angeles to San Francisco is \$15.

Mr. Blanchard says [reading]: "(m) Railway companies sometimes decline to issue reduced-fare tickets of such forms as are easily manipulated, because of the certainty that scalping will ensue and thus unduly extend the privilege granted to unauthorized users of such tickets. The same fear actuates some companies to impose conditions upon the faces of their special tickets and limit their durations of sale and use, whereas, if scalpers' offices were abolished, they could

safely dispense with such safeguards, because the bona fide passenger would not use the methods, misrepresentation, or abuses which scalpers practice."

I say in reply to that that railways should not issue tickets upon which they are unwilling to carry the holder of the ticket. Having fixed the price, sold the ticket, and provided for the transportation of a certain number of passengers, they should carry out the arrangement irrespective as to what particular individual holds the ticket.

Mr. Blanchard says [reading]: "(n) The cessation of scalping would in no wise lessen the public facilities, because each company could retain the services of an experienced scalper by conferring upon him a proper appointment as agent, and regulate him thereafter by the rules which govern their own agents."

This is an acknowledgment that experienced "scalpers" are a recognized benefit to the traveling public. But if the broker was regulated by the rules of the combine he would be quickly robbed of the very attributes that now make him a public convenience.

If it seems desirable that some powerful influence should control ticket sellers I suggest that they be licensed by the Government. Let the requirements be as strict as you choose, so that every seller of tickets must pass the same examination and be subject to the same Government control. This would be something very much to be desired by reputable ticket brokers, and especially by members of the American Ticket Brokers' Association. We do not want a license issued by the railroads and subject to their rules, but by the Government, and let the supervision be over all men who sell tickets, railroads as well as brokers. If a man then violated the law his license could be withdrawn, and his career as a ticket man would end.

Mr. Blanchard says [reading]: "(o) There are two organized bodies of scalpers—the American Ticket Brokers' Association and the Guarantee Ticket Brokers' Association. They have their directors, officers, agents, rules and regulations, they discuss and decide some question of cut fares, and they adopt resolutions and deal with the property of others in which they have no direct interest, while at the same time, under the decisions of the Supreme Court, the railroad can not adopt counter agreements without violating its decisions.

"Moreover, the rules and decisions of the Interstate Commerce Commission do not reach scalpers' fares or practices, because they hold the railways accountable. Furthermore, the fares of the railway companies proper can only be changed by 3 days' notice as to reductions and 10 days' notice as to advances, while the scalpers can change them either way, daily or hourly. In this way a railway company, acting with a scalper, can also change the fares and evade the law. There is a manifest injustice in all this which could and should be corrected by appropriate national legislation."

I can see no objection to the broker filing rates. It is safe to say that should this be required, the law would be equally as well obeyed as is the law relating to interstate commerce by the average railroad.

Mr. Blanchard says [reading]: "(p.) Another feature of ticket brokerage has not been sufficiently urged upon public attention. If a passenger purchasing a through ticket from New York to Chicago is required or desires to discontinue his journey at Buffalo, the unused coupon west of Buffalo will be redeemed by the issuing company or its unused connection. If he takes the same unused coupon to a scalper he is offered by him less for the ticket from Buffalo to Chicago than the railway would redeem it for. His fare from New York to Buffalo would, therefore, be more than its due amount to the extent that he received less than his remaining coupon was worth. Against this the purchasing passenger west of Buffalo may get a ticket under the legal fare, but he is not entitled by law to that preference. In this way we answer the loudly vaunted public advantages of brokers, and venture the further assertion that if scalping was abolished the average fares paid by passengers would not exceed those which prevail under its continuance."

Mr. Blanchard is evidently misinformed. The passenger, in any event, has the option of patronizing the redemption bureau or the broker, as his inclination or the state of his finances will permit.

I think he is rather unfortunate in his selection of an illustration. Take the ticket mentioned. The through rate, first class, from New York to Chicago via Buffalo is \$17; the cheapest rate from New York to Buffalo is \$8. If the passenger after reaching Buffalo was to send in his ticket for redemption to the railroad company they would deduct from the \$17 the tariff from New York to Buffalo, which is \$8, and refund him \$9. The lowest first-class fare between Chicago and Buffalo, or from Buffalo to Chicago, is \$12. There is a difference between the price the railroad company would pay him for his ticket and the regular price of the ticket of

\$3. The passenger holding that ticket, for which the railroad company would pay him \$9, would have little difficulty in selling it to a broker for \$10; the broker in turn would sell it to a customer for \$11. The broker would make a dollar, he would save his customer a dollar, and the original purchaser of the ticket from New York to Chicago would have saved a dollar over the tariff rate in his trip to Buffalo.

I have a number of tickets here that I picked out of my own stock that will probably serve to illustrate this redemption feature [exhibiting tickets].

Here is a ticket issued originally from New York to Chicago. It comes in very nearly like this illustration that Mr. Blanchard attempted on the ticket from New York to Chicago. This is a second-class ticket. The through rate on that ticket was \$17 from New York to Chicago, and the rate for a similar ticket from New York to Detroit was \$13. When the passenger gets to Detroit he would then have \$4 invested in his ticket. The lowest tariff rate between Detroit and Chicago is \$7.75. Should the passenger send that ticket in to the company for redemption, the most that he could get, after going through the necessarily slow methods of railroads in redeeming tickets, would be \$4. If that ticket is good for one day, in the hands of any broker in Detroit it is worth \$5.50. The passenger thus saves \$1.50 by buying that through ticket and selling it at Detroit. The broker could sell it for an advance of a dollar and thus make a dollar; and the passenger buying it of the broker would save \$1.25, if the broker sold it, as they usually do, for \$6.50, after paying \$5.50.

Here is a ticket issued in Kansas City for New York. This part of the coupon reads from Buffalo to New York. It has been used to Buffalo. The through fare was \$29.50; the fare over the same road from Kansas City to Buffalo was \$25.50; the redemption value of that ticket is \$4. The regular fare is \$8. Any broker in Buffalo, if that ticket was good in his hands a day, would pay at least \$6.50 and he could resell it for \$7 or \$7.50—cut the rate, and make something for himself and customer, and the railway company gets the through tariff.

Here is a second-class ticket from Chicago to Buffalo. The through fare is \$9.50. The rate from Chicago to Detroit is \$7.75. There is no second-class rate between Chicago and Detroit. The rate from Detroit to Buffalo, second class, is \$5. The through rate is \$9.50 instead of the added fares of \$5 and \$7.75. The passenger, in buying this ticket in Chicago and riding to Detroit and then sending it in for redemption, would get the difference between \$7.75 and \$9.50, which would be \$1.75. The regular second-class fare from Detroit to Buffalo is \$5. Now, between the broker and the two passengers there is the difference between \$5 and \$1.75 to be divided.

Here are quite a number of tickets that will serve further as illustrations.

Q. (By Mr. KENNEDY.) Are those dead tickets?—A. Yes; they are dead tickets. I suppose they are very dead now, because they can not be sent in for redemption. Here is a ticket over the Grand Trunk Railway from Detroit to Grand Rapids, Mich. Now, it very frequently happens that passengers coming from some Eastern point, en route for Grand Rapids, get into Detroit on Sunday. Except in the summer time, when there are excursion trains, there are no trains on that line on Sunday. There are three regular lines between Detroit and Grand Rapids. Only one runs a Sunday train. The passenger gets into Detroit on Sunday. There is no train on the line for which he holds a ticket by which he can go to Grand Rapids; his business requires him to be there. If this antiscaling bill was a law, he could hold his ticket and send it in for redemption and get the redemption value inside of 30 days. But if he happens to be short of money and wants to make an exchange, or does not want to go through the red-tape routine, he takes it into a broker's office and trades it for a ticket good on a train leaving that day. That is a very ordinary circumstance, and I presume similar cases happen constantly in almost all the cities of the Union.

I have here quite a large number of excursion tickets that have no redemption value. Here is a ticket from Detroit to Ann Arbor; it is good for a stated time and is printed "Not transferable." If an antiscaling law were passed—that is, the law as it has been offered here in Congress—this ticket would be absolutely valueless.

The bill states, as a kind of sop to the public, that the purchaser of a transferable ticket which he is using in the prosecution of a journey may sell that ticket to another person who will use it in the prosecution of the journey. Now, all that railroad companies would have to do to make it illegal for anyone to do that would be to print "Not transferable" on the ticket, as is done in this case. I believe that feature alone would make the law unconstitutional, because it puts it within the power of the railroad company to make an act criminal or not, depending simply on the way they print the ticket.

Here are excursion tickets from Detroit to Lansing, Detroit to Grand Rapids, Detroit to Kalamazoo; they are sold on special occasions. The round trip rate is less than the tariff one way; they have, therefore, no redemption value. If it should be unlawful to sell these tickets the railroad companies would get pay for services which they never render. They would carry a certain number of persons one way and refuse to carry an equal number back.

Here are commutation tickets good in the hands of the bearer, sold in lots of 10 tickets in competition with the electric lines. These come in blocks of 10 at 25 cents, and are good detached; the local fare is 78 cents. If we had an antiscalping law the act of any individual passenger or broker selling one of those tickets to another individual would be criminal. The selling of a ticket that cost 25 cents could subject him to punishment not to exceed \$1,000 fine and a year in jail. Should he steal a ticket the penalty would merely be for petty larceny. Similar cases with relation to commutation tickets could be multiplied indefinitely.

Here is a ticket on the Canadian Pacific from Detroit to Quebec, issued on the 14th of October and good to the 23d. It bears the printed statement, "Not transferable;" no name appears on the ticket; it does not show to what individual issued. The ticket was sold for one fare for the round trip. The regular fare is \$18; redemption value, nothing.

There are any quantity of tickets here that are good in the hands of any passenger, but yet have no redemption value.

In case brokers were not allowed to handle tickets of this character, I do not know as it would be proper to call it a saving, but the gain to the railroads of the United States would amount to a sum that I would hardly dare to compute. I believe it would run into the millions annually. Of course the ticket brokers do not and can not in all cases make this saving to the people by using all these tickets, but they do to an extent that is very important to the traveling public.

We had at one time a State law in Michigan requiring railroads to issue a family mileage ticket. The ticket was printed with the usual restrictions, and in large letters the State laws of Michigan were referred to—the nontransferability of the ticket—that the conductor would take it up and collect fare, etc., if offered by other than the original purchaser. A prominent passenger agent in that State, desiring to increase the travel on his road, put these tickets in large quantities into the hands of brokers and guaranteed them against question. We worked amicably for some time. But suddenly the passenger agent changed his mind and issued orders to his conductors, and a great many of these books which we had a right to assume had been bought under that understanding were taken up. For books costing \$20 I got in some cases no more than a ride of 100 miles—\$2—and the loss to me was \$18. There was no recourse unless we went into court and established the circumstances, and that does not pay. Ticket brokers are long-suffering. They can not afford to quarrel, because it interferes with future business, not only with the railroad in question but with any other railroad that they may deal with. This is perhaps enough to illustrate the idea.

Mr. Blanchard says [reading]: "(g) The payment of commissions by railroad companies is an inciting cause to the continuance of scalping, because such commissions are often divided between scalper and passenger. The payment of commissions is justly chargeable upon the railways. Therefore I think that with the discontinuance of the one should go the stoppage of the other, and the perpetuation of either or both of the evils may prevent, in some instances, open and uniform reductions of fare more nearly to the net basis received out of the fares from which commissions and scalping must be deducted before the real or true fares are ascertained."

When a railway pays a commission for the sale of a ticket it necessarily agrees to accept a net rate for the ticket, and can not be defrauded if the ticket is sold for any amount above the net price. Should an antiscalping law be passed, an agent with authority from a transportation company would not be subject to punishment for doing any of the acts complained of by Mr. Blanchard.

Mr. Blanchard says [reading]: "(r) I believe you would promptly advocate our view if corresponding brokerage offices were opened throughout the country for scalping freight rates through advancing, reducing, manipulating, and secretly and fraudulently altering them for the benefit of some shippers by persons utterly unauthorized to deal with such values and bills of lading. Yet I know of no act or justification in the scalping of tickets and fares which would not with equal justice warrant similar scalping in freight rates and bills of lading."

With reference to the statement that he knew of no justification in the scalping of passenger tickets that could not apply to freight rates, I think I entirely agree with the gentleman. I think it would be greatly to the interests of the people who pay freight rates if there were brokers in that line. The average shipper

would gladly welcome some method of evading the often arbitrary and excessive rates extorted from freight shippers. I believe the ticket broker has been a useful factor in correcting abuses in passenger traffic, and if the same conditions could obtain in freight, a great many of the abuses that are now so patent, and have been brought out in the testimony that has been heard by this commission, could be done away with.

Mr. Blanchard says [reading]: “(s) I leave to counsel the leading arguments growing out of various decisions pro and con, some of them recent, upon this subject. I am, however, qualified to discuss it by the statement that if that law is best which is expressive of the highest justice, then an act should be passed in this respect which will secure for the mutual, personal, and commercial relations of the citizen and carrier the observance of reciprocal justice, right, and the protection of property. I also leave in their more competent hands the questions of legislative passes.”

Now, as to the legal arguments I want to call your attention to the opinion of the court of appeals of New York. It took the position that the business of ticket brokerage was beneficial and that any act prohibiting it was unconstitutional.

Mr. KENNEDY. I should like it to be understood that that decision is to be printed in full in Mr. Lindenberg's testimony. I think it is important that we should have it in that shape.

Mr. A. L. HARRIS. If there are no objections, that will be done.

ANTISALPING BILL UNCONSTITUTIONAL

Opinion of the court of appeals of New York, decided November 22, 1898

[The People of the State of New York ex rel. George Tyroler, appellant, v. The Warden of the City Prison of the City of New York, respondent. (Decided November 22, 1898)]

Appeal from an order of the appellate division, first department, affirming an order of Mr. Justice Lawrence dismissing relator's petition for a writ of habeas corpus and remanding him to the custody of the defendant.

The relator is a citizen of the State of New York and the United States, and immediately prior to his arrest, and for several years before that time, had been engaged in the city of New York in the business of selling, and offering for sale, and procuring tickets, giving, and purporting to give, the right to a passage and conveyance on vessels and railway trains.

He is charged with having received the sum of \$8.30 as a consideration for a passage or conveyance upon a ferryboat, train, and vessel from the city of New York to the city of Norfolk, Va., and for the procurement of a ticket giving the absolute right of passage and conveyance upon such ferryboat, train, and vessel, he not being at the time an authorized agent of the owners or consignees of such vessel, or of the company running such train. It is not pretended that the relator did not come into the possession of the tickets lawfully and by purchase from the transportation companies issuing them.

The relator sued out a writ of habeas corpus and demanded his discharge from the custody of the defendant on the ground that the act of 1897 (Ch. 506) violated certain provisions of the constitution of the State of New York and the Constitution of the United States, and was therefore void.

The special term made its order dismissing the writ and remanded the relator.

The appellate division affirmed that order.

Samuel Untermyer for appellant.

Asa Bird Gardner and James D. McClelland for respondent.

PARSON, Ch. J.: The statute that appellant insists is in derogation of the limitation placed upon the legislative power by the people, through the constitution of the State, reads as follows:

“SECTION 1. The Penal Code is hereby amended by inserting therein a new section, to be known as section 615, to read as follows: ‘Sec. 615. Sale of passage tickets on vessels and railroads forbidden, except by agents specially authorized.’

“No person shall issue or sell, or offer to sell, any passage ticket, or an instrument giving or purporting to give any right, either absolutely or upon any condition of contingency, to a passage or conveyance upon any vessel or railway train, or a berth or stateroom in any vessel, unless he is an authorized agent of the owners or consignees of such vessel, or of the company running such train, except as allowed by sections 618 and 622; and no person is deemed an authorized agent of such owners, consignees, or company, within the meaning of the chapter, unless he has received authority in writing therefor, specifying the name of the company, line, vessel, or railway for which he is authorized to act as agent, and the city, town, or village, together with the street and street number, in which his office is kept, for the sale of tickets.

“SEC. 2. Section 616 of the Penal Code is hereby amended so as to read as follows: ‘Sec. 616. Sale by authorized agents restricted. No person, except as allowed in section 622, shall ask, take, or receive any money or valuable thing as a consideration for any passage or conveyance upon any vessel or railway train, or for the procurement of any ticket or instrument giving or purporting to give a right, either absolutely or upon a condition or contingency, to a passage or conveyance upon a vessel or railway train, or a berth or stateroom on a vessel, unless he is an authorized agent within the provisions of the last section; nor shall any person, as such agent, sell, or offer to sell, any such ticket, instrument, berth, or stateroom, or ask, take, or receive any consideration for any such passage, conveyance, berth or stateroom, except at the office designated in his appointment, nor until he has been authorized to act as such agent according to the provisions of the last section, nor for a sum exceeding the price charged at the time of such sale by the company, owners, or consignees of the vessel or railway mentioned in the ticket.’

“Nothing in this section or chapter contained shall prevent the properly authorized agent of any transportation company from purchasing from the properly authorized agent of any other transpor-

tation company a ticket for a passenger to whom he may sell a ticket to travel over any part of the line for which he is the properly authorized agent, so as to enable such passenger to travel to the place or junction from which his ticket shall read."

The remaining portion of the section relates to the redemption of tickets purchased from an authorized agent of a railway company, under certain contingencies, and within certain periods of time, and is not in any wise involved in this appeal.

Having observed how the statute reads, it will be well next to analyze it and see if we can find out what was intended to be accomplished and is in fact accomplished by the phraseology of the statute, in order that we may ascertain whether the statute is in contravention of any of the rights secured by the Constitution to the citizen. It will be observed in the first place that it does not prohibit the sale of tickets absolutely, nor does it limit to the particular transportation company over whose route he desires to be conveyed the right to sell tickets to the traveler.

It may be said in passing that the last assertion is in conflict with the position taken by the learned judge who wrote the opinion of the appellate division; for he assumes that as only persons appointed agents can sell, the effect of the provision is that a corporation "shall only sell through its agents and is merely a declaration that the corporation itself was to sell its tickets."

The first section and the first part of the second section do restrict the sale of passage tickets to agents specially authorized by transportation companies, and if there was nothing else in the statute upon the subject it would bear the construction put upon it that its only effect is to confine the right to sell passage tickets of a corporation to that corporation itself, which can act only through agents; but between the opening and the closing sentences of the second section may be found the following: "Nothing in this section or chapter contained shall prevent the properly authorized agent of any transportation company from purchasing from the properly authorized agent of any other transportation company a ticket for a passenger to whom he may sell a ticket to travel over any part of the line for which he is the properly authorized agent, so as to enable such passenger to travel to the place or junction from which his ticket shall read."

Thus we see that the moment a man becomes the agent of a transportation company he is by that designation authorized to buy tickets of any other transportation company in the United States or the world, and may sell such tickets to any person who applies for them. In the sale of tickets of the various transportation companies, other than those of the company of which he is an agent, he necessarily acts as a broker. He can buy the tickets and sell them again, making a profit that may perhaps depend more or less on the degree of competition between railroads in various parts of the country.

Clearly, the agent of a transportation company, in the purchase and sale of tickets of foreign corporations, is not engaged in selling the passage tickets of the transportation company appointing him. It is not the sale of the tickets of his principal alone that the agent is thus engaged in, but when a transportation company appoints an agent to sell its tickets, then the State, by this statute, steps in and attempts to clothe him with the power which it takes from all other citizens to deal in the tickets of as many other transportation companies as he may be able to make satisfactory arrangements with.

This leads us to note another interesting feature of this remarkable statute. The buying and selling of passage tickets is not abolished. It is only condemned where the seller has not authority from some one of the transportation companies to act as its agent. It has happened before that for the protection of the people the lawmaking power has provided for an examination for the purpose of ascertaining whether applicants possessed suitable qualifications as to character, intelligence, and financial responsibility to fill certain positions of trust or to engage in a business which might prove dangerous to the people in the hands of a person either incompetent or of bad character, but in no instance has it conferred a general and unlimited power of appointment upon a class of persons or corporations wholly unconnected with the State government.

It may possibly be that there was such a situation as would have justified an enactment placing some restrictions upon those engaged in the selling of passage tickets and prescribing penalties by way of fine or imprisonment for those who should break over such restraints. Our excuse legislation affords an illustration. By its provisions all are permitted to sell liquor within certain limitations that apply to all citizens alike, and for the violation of the regulations of the traffic are provided certain penalties that are expected to assure to the public some measure of protection from unlawfully engaged citizens engaged in the business.

But this act simply turns over to the transportation companies the selection of those who are hereafter to be permitted to sell tickets. It imposes no restraints whatever upon the appointing power, nor upon the agent selected, other than that in the purchase of tickets he must confine himself to the properly authorized agents of the transportation companies. The business of buying and selling tickets, as to such agents, continues to be a legitimate business, but to all citizens other than those who may be selected by the transportation companies the right to buy and sell tickets is denied, and an actual sale by them constitutes a felony. The act itself is silent as to the motive of its enactment by the legislature, and it contains no suggestion as to the public interests which its purpose is to subserve.

Ticket brokerage as a business has been in existence for many years. It is a matter of common knowledge that at great agencies, such as Cook's and Gaze's, tickets can be purchased over a great portion of the transportation routes of the world. Intending travelers in great numbers have gone to those agencies for advice as to choice of routes to be taken in contemplated journeys and to purchase the tickets for the trip, whether it should require days, or weeks, or months to make it.

The traveling public in large numbers have come to make use of the facilities afforded by such agencies, of which there are now very many. And Cook's and Gaze's are among the agencies that must go out of business in this State if this statute can live, unless some transportation company shall deem it wise to clothe them with the authority to act as its agents.

It is asserted by counsel that the traveling public and the transportation companies have been so defrauded by the acts of the brokers in the selling of unused or alleged to be unused passage tickets as to call for legislation of a protective character, of which this statute is the outcome. The tendency of the times undoubtedly is to rush to the legislature for a cure for all the grievances of citizens, whether real or imaginary, and many novel experiments in legislation are the result.

But usually in case of wrongs penalties have been provided. It is a novel legislation indeed that attempts to take away from all people the right to conduct a given business because there are wrongdoers in it, from whose conduct the people suffer. But where in the statute is to be found the evidence that its purpose is to prevent fraud? "In the title of the act," answers counsel, and with that answer he has to be content. For while the act is entitled "Frauds in the sale of passage tickets," the body of the statute does not contain any reference to forged, altered, used, or stolen tickets. The sale of such tickets is made a punishable offense under other sections of the Penal Code.

The provisions of the act, therefore, have reference to the selling of valid tickets regularly issued by a transportation company. Can the legislature declare such sales to be fraudulent, or prohibit them on the ground that it tends to prevent fraud? If the act prohibited is fraudulent, there can be no doubt that the legislature, under its police power, may provide for its punishment; but

whether it may, under such power, interdict the sale of a valid ticket by one person to another upon the pretext that fraud will thus be prevented presents a very different question.

I confess I am unable to see how such a sale defrauds a transportation company. If a transportation company sells a ticket from New York to San Francisco, it undertakes to carry the holder from one place to the other. It costs the company no more to carry one person than it does the other. How, then, can it be defrauded or in any way prejudiced by the transfer of such a ticket by the purchaser to another person? It is said that the prohibition of such a sale tends to protect the traveler from being defrauded. If it is a sale of a valid ticket, no fraud can possibly result; and if it is not a sale of a valid ticket, then the sale is fraudulent and is prohibited by other provisions of the Penal Code.

Only one prop remains which it is pretended can support the weight of this statute, and that is that the penal laws not having proved sufficiently efficacious to wholly prevent fraud, an emergency is presented which justifies the taking away from the general public the right to engage in the business of ticket selling.

It is not contended that the business of ticket brokerage is in itself of a fraudulent character. The business can be honestly conducted; it has been so conducted in the past by honest men engaged in it; and the most that is asserted is that there are some men engaged in the business who have imposed on the public. The same assertion can be made with equal truth of every business, trade, and profession.

Because some coal dealers and venders in sugar cheat in weight, and dealers in paints and oils in measurements, and in tobacco in quality, it has not hitherto, we venture to say, been thought the proper remedy to make it a felony for persons to hereafter engage in such business unless they shall have been duly appointed as agents by the corporations manufacturing or producing the product.

Still another motive for this enactment is suggested, and that is that its real purpose is to enable transportation companies to compel others with which they may enter into pooling arrangements to preserve their agreement from secret violation, which is frequently the outcome under the present ticket-brokerage system, which offers an avenue by which the weaker corporation to such an agreement can dispose of its tickets at a price lower than that agreed upon.

In *Nashville, Cincinnati and St. Louis Railway Company v. McConnell* (82 Fed. Rep., 65), where a statute, having apparently the same object in view as this one, was under consideration, the court in its opinion quotes from *Minnesota v. Corbet* (57 Minn., 316) the following: "It was also commonly believed that, in order to evade statutes designed to secure uniformity of rates and to prevent discriminations, some carriers of passengers were in the habit of placing large blocks of their tickets with 'scalpers,' ostensibly not their agents, for sale at cut rates. To remedy these and similar abuses, real or supposed, this statute was passed. That all its provisions have some relation to, and tendency to accomplish, this end is quite clear."

Counsel argue that the helpfulness of the ticket broker in securing to the traveling public the benefits of such competition was of such a fraudulent character as to wholly justify the legislation, and appeal to the decisions quoted from in support of such contention. But we pass for the present the subject of motive, to be again referred to when we come to consider whether, under the police power, the legislation can be justified.

Whatever the legislature's motive, the fact is that it has passed an act which does not declare ticket brokerage unlawful, for it allows any person who may be fortunate enough to secure an appointment as agent for a transportation company to engage in ticket brokerage, but the act does declare that if any person, other than an agent of a transportation company, undertakes to engage in the passenger-ticket brokerage business he shall be guilty of a felony; in other words, that it is unlawful for all citizens of New York to engage in the buying and selling of passage tickets unless empowered to do so by the written appointment of a transportation company.

Much has been said in argument with reference to this statute in a more agreeable vein, placing the statute in a somewhat more attractive form, but it is as well to go beneath the surface and get at the truth, which is that the statute was intended to and does, in fact, vest the control of the sale of passage tickets within this State, not only of transportation companies doing business in this State, but throughout the world, exclusively in the hands of such companies.

The business of selling passage tickets continues, therefore, to be regarded as a lawful and legitimate business. Public policy is still declared to favor a business which recognizes the propriety of the middleman between the passenger and the transportation company, but the right to engage in it is denied to the general public.

The question, then, is whether the organic law prohibits legislation of this character.

Before referring to the provisions of the Constitution that it is confidently asserted condemn such legislation, it may not be out of place to note that the granting of monopolies or exclusive privileges to corporations or persons has been regarded as an invasion of the rights of others to follow a lawful calling and an infringement of personal liberty from the times of the reigns of Elizabeth and James. The statute of 21 Jac., abolishing monopolies, has been from the time of its enactment regarded as a statutory landmark of English liberty, and that nation has jealously preserved it. It was a part of that inheritance which our fathers brought with them and incorporated into the organic law, to the end that the lawmaking power shall be restrained from interference with it.

In this connection the language employed by Mr. Justice Field in *Butchers' Union Co. v. Crescent City Co.* (111 U. S., 746, 756, 757) is most instructive: "As in our intercourse with our fellow-men certain principles of morality are assumed to exist, without which society would be impossible, so certain inherent rights lie at the foundation of all action, and upon a recognition of them alone can free institutions be maintained. These inherent rights have never been more happily expressed than in the Declaration of Independence, that new evangel of liberty to the people:

"We hold these truths to be self-evident"—that is, so plain that their truth is recognized upon their mere statement—"that all men are endowed"—not by edicts of emperors, or decrees of Parliament, or acts of Congress, but "by their Creator, with certain inalienable rights"—that is, rights which can not be bartered away, or given away, or taken away except in punishment of crime—"and that among these are life, liberty, and the pursuit of happiness, and to secure these"—not grant them, but secure them—"governments are instituted among men deriving their just powers from the consent of the governed."

Among these inalienable rights, as proclaimed in that great document, is the right of men to pursue their happiness, by which is meant the right to pursue any lawful business or vocation, in any manner not inconsistent with the equal rights of others, which may increase their property or develop their faculties, so as to give to them their highest enjoyment. The common business and callings of life, the ordinary trades and pursuits, which are innocuous in themselves and have been followed in all communities from time immemorial, must, therefore, be free in this country to all alike upon the same conditions.

The right to pursue them, without let or hindrance, except that which is applied to all persons of the same age, sex, and condition, is a distinguishing privilege of citizens of the United States, and an essential element of that freedom which they claim as their birthright. * * *

In this country it has seldom been held, and never in so odious a form as is here claimed, that an entire trade and business could be taken from citizens and vested in a single corporation. Such legislation has been regarded everywhere else as inconsistent with civil liberty. That exists only where every individual has the power to pursue his own happiness according to his own views, unrestrained except by equal, just, and impartial laws.

From the opinion of Mr. Justice Matthews in *Yick Wo v. Hopkins* (118 U. S., 356, 370) the following is taken: "But the fundamental rights of life, liberty, and the pursuit of happiness, considered as individual possessions, are secured by those maxims of constitutional law which are the monuments showing the victorious progress of the race in securing to men the blessings of civilization under the reign of just and equal laws, so that, in the famous language of the Massachusetts bill of rights, the government of the Commonwealth 'may be a government of laws and not of men.'"

"For the very idea that one man may be compelled to hold his life, or the means of living, or any material right essential to the enjoyment of life, at the mere will of another, seems to be intolerable in any country where freedom prevails, as being the essence of slavery itself."

These principles have also been incorporated into the organic law of this State. Article 1, section 1, of the State constitution reads as follows: "No member of this State shall be disfranchised, or deprived of any of the rights or privileges secured to any citizen thereof, unless by the law of the land or the judgment of his peers."

Article 1, section 6, of the State constitution provides that "no person shall * * * be deprived of life, liberty, or property without due process of law." The word "liberty," as employed in the provision of the constitution quoted, was considered by this court in *In re Jacobs* (98 N. Y., 98), in a masterful opinion by Judge Earl. He said (pp. 106, 107):

"So, too, one may be deprived of his liberty, and his constitutional rights thereto violated without the actual imprisonment or restraint of his person. Liberty, in its broad sense, as understood in this country, means the right, not only of freedom from actual servitude, imprisonment, or restraint, but the right of one to use his faculties in all lawful ways, to live and work where he will, to earn his livelihood in any lawful calling, and to pursue any lawful trade or avocation."

"All laws, therefore, which impair or trammel these rights, which limit one in his choice of a trade or profession, or confine him to work or live in a specified locality, or exclude him from his own house, or restrain his otherwise lawful movements (except as such laws may be passed in the exercise by the legislature of the police power, which will be noticed later), are infringements upon his fundamental rights of liberty, which are under constitutional protection."

In *People v. Marx* (99 N. Y., 377) this court declared unconstitutional a statute that prohibited the manufacture and sale of any substitute for butter or cheese produced from pure unadulterated milk or cream. Judge Rapallo, speaking for the court, said: "Among these no proposition is now more firmly settled than that it is one of the fundamental rights and privileges of every American citizen to adopt and follow such lawful industrial pursuits, not injurious to the community, as he may see fit."

"The term 'liberty,' as protected by the Constitution, is not cramped into a mere freedom from physical restraint of the person of the citizen, as by incarceration, but is deemed to embrace the right of man to be free in the enjoyment of the faculties with which he has been endowed by his Creator, subject only to such restraints as are necessary for the common welfare."

In *People v. Gilson* (109 N. Y., 398) a statute was declared to be unconstitutional which prohibited the sale of any article of food, or offering or attempting to do so, upon any representation or inducement that anything else would be delivered as a prize, premium, or reward to the purchaser. Judge Peckham, in delivering the opinion of the court, after considering the statute said, (p. 399) "A liberty to adopt or follow for a livelihood a lawful industrial pursuit, and in a manner not injurious to the community, is certainly infringed upon, limited, perhaps weakened or destroyed, by such legislation."

Argument certainly is not needed in the light of these decisions to support the assertion that the "liberty" of this relator and other citizens of this State to engage in the business of brokerage in passage tickets is sought to be interfered with by the statute under consideration, for brokerage in such tickets has been a lawful business in this State for many years and many persons have pursued it. It is still a lawful business, although the right to engage in it is limited to such persons as may be appointed by the transportation companies.

The statute is, therefore, in contravention of the State constitution, and is void unless its enactment by the legislature constituted a valid exercise of the police power. That power is very broad and comprehensive, and has not as yet been fully described or its extent plainly limited, but it is exercised to promote the health, comfort, safety, and welfare of society. In each of the last three cases cited it was invoked by counsel to sustain a statute, and it received very careful consideration at the hands of this court.

It was held that the power, however broad and extensive, is not above the Constitution, in obedience to the commands of which the courts will protect the rights of individuals from invasion under the guise of police regulations, when it is manifest that such is not the object and purpose of the regulation; and while it is the general province of the legislature to determine what laws and regulations are needed to protect the public health, comfort, and safety, courts must be able to say, upon a perusal of the enactment, that there is some fair and reasonable connection between it and the ends above mentioned. Unless such relation exists, an enactment can not be upheld as an exercise of the police power.

The doctrine of these cases was very recently considered and reasserted by this court in *Colton v. Lisk* (158 N. Y., 189), and its further discussion at this time would be a work of supererogation. Under the law of this State, therefore, it is the duty of the courts to examine legislation complained of as in violation of the rights secured to the citizens by the Constitution, for the purpose of ascertaining whether the health, morals, safety, or welfare of the public justifies its enactment.

In passing, it may be observed that while it is undoubtedly the rule that railroads, steamboats, warehouses, and other associations of that nature, impressed with a public duty and intended to perform certain quasi-public functions, may be the subject of legislative control and regulation so long as the legislature does not transcend the limit of State or Federal Constitution, still that rule is without application to the features of the statute before the court on this review.

This inquiry involves such portion of the statute only as undertakes to prohibit citizens of the State from engaging in the brokerage business in passage tickets. That portion of the statute certainly places no burden upon transportation companies, nor does it in any way regulate the manner in which transportation companies shall conduct their business or any part of it.

The legislature has no jurisdiction to regulate the methods of business of foreign transportation companies, nor can it prevent them from selling their passage tickets in this State, but by this act it does undertake to prevent any citizen of this State from purchasing the passage tickets of foreign companies for sale to others, unless such citizen shall have been regularly appointed an agent by some transportation company. The right hitherto exercised by citizens to deal in passage tickets over transportation routes without, as well as within, this State, is sought to be cut off.

Again, it may be conceded that it is within the power of the legislature to regulate the manner in

which certain kinds of business may be conducted, that it may require one seeking to engage in a given pursuit to secure from the State, or one of its agents, a license; that it may require one pursuing any particular occupation to pay a tax for the privilege of conducting his business, and that as a condition to the right of carrying on a business that in the hands of incompetent persons may be productive of injury to others, the legislature may require that before engaging therein one must satisfy the public authorities that he is competent and morally qualified to conduct it.

But none of these methods was adopted. No attempt is made to exclude persons of bad character from engaging in the business, nor are the public authorities given the right to determine, by examination or otherwise, the character of the person to be engaged in it, but the transportation companies alone are invested with the power to allow whomsoever they will to engage in the business.

Nor can the contention be tolerated that because there have been, in times past, dishonest persons engaged in the ticket-brokerage business, with the result that frauds have been perpetrated on both travelers and transportation companies, therefore the legislature can deprive every citizen engaged therein of the "liberty" to further conduct such business.

Stringent rules undoubtedly may be enacted to punish those who are guilty of dishonest practices in the conduct of such a business and the machinery of the law put in motion for its rigorous enforcement, but to cut up, root and branch, a business that may be honestly conducted, to the convenience of the public and the profit of the persons engaged in it is beyond the legislative power.

If the law were otherwise, no trade, business, or profession could escape destruction at the hands of the legislature if a situation should arise that would stimulate it to exercise its power, for in every field of endeavor can be found men that seek profit by fraudulent processes. Transportation tickets have been forged, it is said, so have notes, checks, and bank bills. Railroad companies are no more bound to honor forged tickets than the alleged maker of a forged note is bound to pay it.

An innocent person who suffers by parting with his money on a forged ticket has his remedy against the vendor just the same as has the bank that discounts a forged note. Such instances might be multiplied, but it would serve no good purpose, for it is well known that no business can be suggested through which innocent parties may not be occasionally victimized. But because of that fact honest men can not be prevented from engaging in their chosen occupations.

Again, it is said that ticket brokers enable the railroads to engage in unfair competition. This is accomplished by the sale to the broker by a competing railroad, at much less than the regular rates, of a block of tickets that the broker is enabled to sell to his customers, and this to a certain extent takes travel from its competitors.

An opinion is cited in which the court in another jurisdiction denounces the ticket scalper for engaging in a business of this character, and pronounces such business fraudulent alike in its conception and operation, but we pass this opinion without other comment than to say that whatever may be regarded as the law in other jurisdictions, in this one it is well established that the public welfare is best subserved by the encouragement of competition (*People v. Sheldon*, 139 N. Y., 263; *Judd v. Harrington*, id., 165), and hence this so-called reason furnishes no support to the claim that this legislation was for the public good.

I have now called attention to all the arguments that have been advanced in support of the claim that the provisions of the statute under consideration are so evidently intended for the public good as to constitute a valid exercise of the police power by the legislature, and those arguments seem so wholly without merit as to suggest that they constitute a mere pretext put forward to uphold legislation hostile to the liberty of the citizen as that word is used in the Constitution. If the views expressed be well founded, it follows that it is the duty of the court to declare that portion of the statute we have considered to be in contravention of the Constitution and void.

The order should be reversed and the prisoner discharged.
(A copy.)

E. H. SMITH, *Reporter*.

THE WITNESS. There is an amusing circumstance in connection with that matter. George H. Daniels, general passenger agent of the New York Central Railroad, in his talk before the Senate committee when the antiscalping bill was under consideration, made the statement that the great Empire State of New York, of which he was proud to say he was a citizen, had stamped this contemptible business with the brand of outlawry. Well, it happened a few days later that the highest court—the court of appeals of New York, of this great Empire State of which he was so proud to be a citizen—declared the business to be a legal one, and that it had been honestly conducted and was being honestly conducted, and also declared the antiscalping law of that State unconstitutional. Mr. Daniels did not for a moment stop his efforts to secure the passage of the bill in Congress. The vote in the House of Representatives was taken a few days after that decision had been rendered. Failing in the Senate, the bill died with the Fifty-fifth Congress, but was promptly introduced at the next session—the present session. Being just before a national election, the bill was shelved in committee, because it is not a popular measure with the people, and might injure the chances of the reelection of a great many of the Congressmen who were under obligations to railroad managers to vote for it. The only reason I can give for its not being brought up in the later days of this session (it is now lying in committee) is that there is too much business before Congress for it to be considered, and I think anyway that with the present Congress it would have no chance for passage.

The object of the tremendous effort of two years ago to pass an antiscalping bill became apparent when the edict went forth a year ago to stop the payment of commissions. With the broker out of the way, commissions discontinued, and competition throttled, the absorption of weak lines would be easy work and pools could be easily and secretly conducted.

There may possibly be some reason in the argument that absolute equality should prevail in freight rates, for every dealer, every farmer, and every consumer of goods is interested. It is due to the people that rates should be reasonable and uniform. It is right to the owners and managers of railways that they

should receive a fair compensation for services performed. But unless the element of competition is eliminated, the building of unnecessary lines prohibited, and the conduct of the railway and steamship lines taken out of the hands of the enterprising "hustlers for trade" who now manage them, I do not understand how the desired end can be accomplished.

Now, as to passenger traffic, I can not see how the price of tickets can be of so great and absorbing interest to the welfare of the country as to call for interference by Congress. While all are affected by freight rates, but a small proportion of our population is affected by passenger tariffs. The price of sugar, of flour, of potatoes, the cost of clothing and boots and shoes, and even the cost of patent medicines, are of more importance to the masses than this subject of passenger travel.

We believe the practice of circuitous tickets justifiable. The short line establishes the rate and is naturally entitled to the through business. If a combination of lines is formed that makes a mileage of from 100 to 500 more, and a loss in time to the passenger of from 3 hours to 24 in transit, a broker is perfectly justified in applying his methods of business to this class of tickets. The railroads seem to act upon the principle that conspiracies against each other are entirely justifiable. Railroad properties may be wrecked, offensive and defensive alliances perfected, rates may be made by illegal agreements, and such actions shall be the law; but what a wicked act for the detestable "scalper," without their most righteous authority, to step in and break up this scheme, with a vulgar intent to make money for himself and effect a saving for his customer!

I believe that is all, and I would be glad now, Mr. Chairman, to answer, to the best of my ability, any questions which the members of the commission choose to ask.

Q. (By Mr. KENNEDY.) What other State has declared an antiscalping law unconstitutional?—A. Pennsylvania was the pioneer in that. I think they passed a law in 1863, but it never was known there was such a law outside of the city of Philadelphia. There is Pennsylvania, Minnesota, New Jersey, Montana, Indiana, Texas, Florida, New York, and Illinois.

Q. What I want to know is this: Did not the court of some other State declare a law to be unconstitutional about the time that the court of appeals of the State of New York acted on this case?—A. Texas. I think the Texas decision was after that of the court of appeals of New York.

Q. When was the Illinois decision given?—A. When we say that these decisions were made in two States declaring it unconstitutional, we refer to Texas and New York. In Illinois I think our only legal opinions were given by the lower courts. The matter was rushed in a peculiar manner before the supreme court of the State of Illinois in a prepared case from some out-of-the-way place. There was no opposition made to it, and in some way a decision was rendered by the supreme court of Illinois. In the lower courts there have been several decisions declaring it unconstitutional, but not in the supreme court.

(The witness submitted copies, taken from the Chicago Law Journal of dates July 29, 1898, and February 17, 1899, of opinions in cases in the circuit court of Cook County, Ill., deciding that the law of that State aimed at ticket brokerage was unconstitutional. So much of said opinions as relates to ticket brokerage follows:)

TICKET BROKERS LAW FORBIDDING SALE OF RAILWAY TICKETS—UNCONSTITUTIONAL.

[The People v. Edward Ullman. In the circuit court of Cook County, Ill. Gibbons, John, judge. (Filed July 23, 1898.)]

Motion to quash indictment.

1. The law of 1875, making it unlawful for any person not authorized by the owner or operator of a railroad to sell or transfer tickets, passes, or other evidence of the holder's title to travel on any railroad or steamboat, is unconstitutional, as the legislature can not make an act criminal which is in itself innocent.
2. The police power of a State defined, and instances given wherein it may be exercised.

GIBBONS, J.: The defendant has been indicted under a statute of this State passed in the year 1875 entitled "An act to prevent frauds upon travelers and owner or owners of any railroad, steamboat, or other conveyance for the transportation of passengers," a part of which act reads as follows:

"That it shall be the duty of owner or owners of any railroad or steamboat for the transportation of passengers to provide each agent who may be authorized to sell tickets or other certificates entitling the holder to travel upon any railroad or steamboat with a certificate setting forth the authority of such agent to make such sales, which certificate shall be duly attested by the corporate seal of the owner of such railroad or steamboat."

Defendant sued out a writ of habeas corpus before me to test the constitutionality of this act, but, upon my suggestion, a motion was made to quash the indictment, and that the question be presented on that motion instead of on habeas corpus.

* * * * *

The constitutionality of the law must be tested with reference to the provision of section 2 of the act, because that is the only part of the act the violation of which is made a penal offense; that is, probably so far as the sale of a ticket is concerned. That section provides: "That it shall not be lawful for any person not possessed of such authority" (meaning the authority specified in the first section), "so evidenced, to sell, barter, or transfer, for any consideration whatever, the whole or any part of any ticket or tickets, passes, or other evidence of the holder's title to travel on any railroad or steamboat, whether the same be situated, operated, or owned within or without the limits of this State."

The act is not aimed at nor directed to the prevention of fraud in respect to the barter, sale, or transfer of tickets or passes which do not entitle the holder to travel on a railroad, steamboat, or the like, but is specially limited to and directed against the barter or sale of tickets, passes, or other evidences of the holder's title to travel, etc.

It is contended that a railway ticket is not personal property, nor a chattel, nor a contract, but merely a receipt for the money paid to transportation. Decisions may be found in support of this proposition, but they do not seem to me to be based upon the reason or logic of the law.

To say that a railway ticket is not personal property, nor a chattel, nor a contract is, in my opinion, judicial nonsense. A promissory note is not personal property nor a chattel in the sense that the same reasoning might be applied to railroad tickets. It is simply the evidence of an indebtedness from the maker of the note to the legal holder thereof. What is a railroad ticket? It is simply the evidence of the holder's right to travel over the roads specified thereon, and, when not limited to any particular person, it may be sold, transferred, or given away by the holder thereof the same as the owner of a promissory note may make a gift, sale, or transfer thereof.

I am not unmindful of the fact that railroads, steamboats, warehouses, and other associations of that nature, impressed with a public duty and intended to perform certain quasi-public functions, may be the subject of legislative control and regulation so long as the legislature does not transcend the limit of the State or Federal Constitution. But it is claimed in this case, a contention which has been urged with great earnestness in many cases and which has found support in judicial decisions, that the legislature, under no police power, may enact any law which it may deem expedient for the public good, and that, unless the law falls within the ban of some constitutional provision, State or national, the courts must uphold it. There is no conceivable doctrine which would be more dangerous to the State if sanctioned by the courts than the doctrine here contended for.

Blackstone, in his classification of fundamental rights, says: "The third absolute right inherent in every Englishman is that of property, which consists in the free use, enjoyment, and disposal of his acquisitions without any control or diminution save only by laws of the land." * * * The laws of England are, therefore, in point of honor and justice, extremely watchful in asserting and protecting this right. Upon this principle the Great Charter has declared that no free man shall be disseized or divested of his freehold or of his liberties or free customs but by judgment of his peers or the law of the land. * * * In vain may it be urged that the good of the individual ought to yield to that of the community; for it would be dangerous to allow any private men or even any public tribunal to be the judge of this common good and to decide whether it would be expedient or not. Besides, the public is nothing more essentially interested than in the protection of every individual's private rights as modeled by the municipal law. In this and similar cases the legislature alone can, and indeed frequently does, interpose and compel the individual to acquiesce. But how does it interpose and compel? Not by absolutely stripping the subject of his property in an arbitrary manner; but by giving him a full indemnification and equivalent for the injury thereby sustained." This absolute right of property inherent in every Englishman was supposed to be protected against legislative spoliation, not only in Magna Charta, but by the unwritten constitution of England, yet the fact remains that if the British Parliament should pass a law declaring that the property of A should thereafter vest in B even without compensation, there is no power in the English judiciary to declare such an act void or unconstitutional.

If the contention here urged should be sanctioned as sound law, the State legislature would be as omnipotent as the British Parliament, and there would be no power in the judiciary of this State or of the United States to annul its enactments.

Mr. Justice Miller, delivering the unanimous opinion of the Supreme Court of the United States in *Yates v. Milwaukee*, 10 Wallace, 497, asserts that the mere declaration by the city council of Milwaukee that a certain structure was an encroachment or obstruction did not make it so; nor could such declaration make it a nuisance unless it in fact had that character.

"It is a doctrine," he says, "not to be tolerated in this country that a municipal corporation, without any general laws, either of the city or of the State within which a given structure can be shown to be a nuisance, can, by its mere declaration that it is one, subject it to removal by any person supposed to be aggrieved, or even by the city itself. This would place every house, every business, and all the property of the city at the uncontrolled will and temper of the legal authorities."

In *Loan Association v. Topick*, 20 Wallace, 655, this same immortal jurist was the first to give judicial intenance to the great principle of individual right and personal security under the law when he said: "It must be conceded that there are such rights in every free government beyond the control of the State. A government which recognized no such rights, which held the lives, the liberty, and the property of its citizens subject at all times to the absolute disposition and unlimited control of even the most democratic depository of power is, after all, but a despotism. It is true it is a despotism of the many, of the majority, if you choose to call it so; but it is none the less a despotism."

"It may well be doubted if a man has to hold all that he is accustomed to call his own or in which he has placed his happiness, and the security of which is essential to that happiness, under the unlimited dominion of others; whether it is not wiser that this power should be exercised by one man than by many. The theory of our Governments, State and National, is opposed to the deposit of unlimited power anywhere. The executive, legislative, and judicial branches of these Governments are all of limited and defined powers. There are limitations on such power which grow out of the essential nature of all free governments—implied reservations of individual rights, without which the social compact could not exist, and which are respected by all governments entitled to the name."

Speaking of the police power of the State, Mr. Justice Field held in *re Jacobs*, 98 New York, 98, that "Under the conduct of an individual and the use of property may be regulated so as to interfere to some extent with the freedom of the one and the enjoyment of the other; and in cases of great emergency, engendering overruling necessity, property may be taken or destroyed without compensation and without what is commonly called due process of law. The limit of this power can not be accurately defined, and the courts have not been able or willing definitely to circumscribe it; but the power, however broad and extensive, is not above the Constitution; when it (the Constitution) speaks it must be heeded. It furnishes the supreme law, the guide for the conduct of legislators, judges, and executive persons, and, so far as it imposes restraints, the police power must be exercised in subordination thereto."

What is meant by the police power of the State? It is that power and dominion inherent in every

government over the liberty and property of the individual which may be exercised in case of necessity for the protection of the general public. For example, the legislature may authorize health commissioners or other officers of the law to quarantine a person suffering from smallpox or other infectious disease, at his home or elsewhere, and thus deprive him for the time being of his personal liberty; may justify the invasion of the habitation of such a person so as to burn or destroy his effects in order to prevent the spread of the disease; may empower municipal officers to blow up buildings in order to stay the ravages of a conflagration which threatens the destruction of a city; may justify the seizure and distribution of food in order to avert a threatened famine; may pass laws for the regulation or suppression of gambling or of the sale of intoxicating liquors, based upon the assumption that the conduct of such a business is destructive of public morals and has a tendency to promote pauperism and crime. And even in such cases the reasonableness of the law is always open to inquiry by the judiciary. But the legislature can not, under the guise of the police power, prohibit the sale of wholesome food, or declare that to be criminal which in its nature can not be destructive of morals or detrimental to the well-being of the people.

* * * * *

Our institutions are not founded on the feudal principle that a parliament is supreme, omnipotent, but are founded upon compact—founded upon a written Constitution, binding upon the State and upon the individual, and a guide for officers, for legislators, and for judges. *People v. Eden*, Chicago, L. J. Monthly, 1895, p. 819, S. C., 161 Ill., 296.

Cases might be multiplied asserting and maintaining this principle, but I deem it unnecessary to do so, because if we once concede that the police power of a State is above the Constitution, we might as well abolish all constitutional restrictions and adopt the feudal principle prevailing in Continental Europe based upon the theory of divine right of kings and the omnipotence of parliaments.

I, for one, shall never follow the decisions of any court announcing such a dangerous doctrine, and, I am happy to say, that I am not compelled to do so in this case, because the supreme court of Illinois has never asserted a doctrine that is destructive of personal liberty, individual security, or the right of property.

There was a time when courts strove to arrive at the right and justice of each particular case based upon its own peculiar facts by applying some legal truth, some maxim of the law, to the facts of that case. But now we seldom reason from first principles of right and justice, but rather content ourselves by blindly following some judicial bellwether whose decision fills space in an encyclopedia and is quoted approvingly by a modern book builder.

This criticism is fully warranted by the fact that our supreme court, in what is alleged to be a fictitious case presented to it, based upon an indictment charging an infraction of the statute under consideration, was led to proclaim its constitutionality, and the courts of other sister States have upheld similar statutes, quoting the case of *Burdick v. The People*, 119 Ill., 600, as a precedent.

In 162 Ill., 48, the attention of the supreme court was directed to this case on a motion to expunge the opinion from the record on the alleged ground that the court was imposed upon and falsely induced to render a decision sustaining the constitutionality of the act, but the court, by a vote of 4 to 3, refused the motion on the ground that the parties who made the motion were strangers to the record, and the court made the novel and significant announcement that the judgment of affirmance in the *Burdick* cases and the opinions of the court in deciding them are conclusive only as between the parties to those cases. This announcement was made knowingly, and there can be no mistaking its meaning in view of the record made in the case. So that I am not bound by the decision in the *Burdick* cases unless it should appeal to me as sound law.

In view of the many able and exhaustive decisions of the supreme court announcing principles so antagonistic to the rule laid down in the *Burdick* cases, I am constrained to believe that this law would never have received the seal of its approval had the case been presented to it in all its bearings. I am so confident that the statute under consideration is not only in conflict with the bill of rights of our Constitution the fourteenth amendment, and the interstate commerce clause of the National Constitution that it seems unnecessary to further discuss the question or repeat the reasoning advanced by me in declaring the harsh Sunday closing law unconstitutional in *People v. Eden*, supra. I am willing, however, that the cause should be appended to the supreme court, and, notwithstanding the fact that I am convinced of the unconstitutionality of the law, I will overrule the motion to quash the indictment so that if the defendant is convicted thereon an appeal may be taken to the supreme court, where that court will have a chance to explain its former ruling, and if need be overrule and nullify it.

TICKET BROKERS' ACT UNCONSTITUTIONAL—RAILROAD TICKET PERSONAL PROPERTY OF PURCHASER—
POLICE POWER—JUDICIAL NOTICE—HABEAS CORPUS

(Opinion filed February 16, 1899.)

[*People ex rel. Bennett D. Marks et al. v. James Pease, Sheriff*. Circuit court of Cook County. Richard Prendergast, solicitor for relator. Charles S. Deenen, State's attorney, and W. S. Forrest, solicitors for respondent.]

- (1) The law of 1875, making it unlawful for any person not authorized by the owner or operator of a railroad to sell or transfer tickets, passes, or other evidence of the holder's title to travel on any railroad or steamboat is unconstitutional, as the legislature can not make an act criminal which is in itself innocent.
- (2) The police power of a State defined, and instances given wherein it may be exercised.
- (3) A person, by a proceeding in habeas corpus, may, before trial, test the constitutionality of the statute under which he is indicted.

GIBBONS, J.: In 1806 the legislature of this State enacted a law having for its apparent scope and purpose the prevention of frauds upon travelers and owners of railroads, steamboats, or other conveyances for the transportation of passengers. The first section thereof provides that it shall be the duty of the owner of any railroad or steamboat for the transportation of passengers to provide each agent who may be authorized to sell tickets or other certificates entitling the holder to travel upon such railroad or steamboat with a certificate setting forth the authority of such agent to make such sales. The second section provides that it shall be unlawful for any person not possessed of such authority to sell, barter, or transfer for any consideration the whole or any part of any ticket or tickets, passes, or other evidence of the holder's title to travel on any railroad, whether the same be situated, operated, or owned within or without the limits of this State.

The petitioner was indicted by the grand jury of this county for violating the provisions of this act, and he sued out a writ of habeas corpus before me to test its constitutionality.

A similar petition was presented in the case of *People ex rel. Edward Ullman*, in July last, but I then insisted upon the question being raised by motion to quash the indictment. Acting upon the suggestion of the court, the case was accordingly submitted, after having been elaborately argued by counsel. I carefully investigated the authorities then presented, and after due deliberation I held that the law was invalid, but I refused to quash the indictment in order to give the prosecution a chance to present the matter to the supreme court of this State. (See opinion published in *extenso*, *People ex rel. Ullman v. James Pease, Sheriff*, volume 3, *Chicago Law Journal Weekly*, p. 337.)

The learned counsel for the people urge with much earnestness that I reached an erroneous conclusion in that case, and still contend that the law is a proper exercise of the police power of the State. In view of the persistent contention of counsel, I have reexamined the questions involved, and the more thought and reflection I have given them the more convinced I am of the correctness of my conclusion. There is, doubtless, much force in the contention of learned counsel, if the crime denounced in the statute was the sale of a ticket which did not entitle the holder to travel thereon, but such is not the aim or purpose of the law. If I enter a railroad office and ask for a ticket from Chicago to New York, and I pay the price demanded therefor, it is as much my property as the coat I wear. I may have purchased the ticket for some member of my family, for my domestic, or friend, or for myself. As I paid the price demanded, it was of no consequence to the company for whom I purchased it.

That the legislature of the State has the power to regulate, restrain, or prohibit the sale of any article or commodity, or the conduct of any business which may be deleterious to health, destructive of morals, or which might produce pauperism or crime, no one will deny.

* * * * *

What is there in the nature of this business which our modern Solons should place under the ban of outlawry?

This court can not plead ignorance of facts which are of common knowledge; and it therefore asserts that the men engaged in the ticket brokers' business have seldom occupied the time or attention of our courts, which is *prima facie* evidence of bar dealings with their patrons, and of earnest efforts to please them. Members of this association are found in every city and in nearly every town which is reached by a railroad, and the traveler who seeks information at their offices as to the best and cheapest mode of conveyance receives it without fee or reward.

Had the supreme court of this State upheld the law in a case between real parties litigant, I should acknowledge its superior authority, but, as it has not, and as the court of appeals of New York, by a majority of its members, has declared a similar act of that State unconstitutional, I have not the slightest doubt but that the act in question is unconstitutional. (See *People ex rel. Tyrder v. Warden of City Prison*, 31 N. E., 1006. Also, the opinion of Judge Bruce of this court in *People ex rel. v. James Pease, Sheriff*, vol. 3, *Chicago Law Journal Weekly*, p. 301.)

* * * * *

The petitioner in this case will be discharged from his illegal restraint, and it is so ordered.
Petitioner discharged.

Q. You say the Texas decision was about the same time as that of New York?—
A. Very soon after, I think. The Texas decision did not go into the merits of the case; it was on a point of law. By the wording of the bill the legislature had left it optional with the railroads as to whether they should or should not print "not transferable" on a ticket. If they did not print that, all right; but if they did print that it was a crime to sell the ticket; and the court threw it out on that point—that it left it optional with the railroad as to whether it should be a crime or not. I am not a lawyer and it is not easy for me to explain these points of law.

Q. You spoke about your responsibility going with the ticket that the traveling man purchased from you unless he signed a contract by which he assumed the responsibility. Is that a common practice?—A. That is a fact, it is a rule, an absolute and invariable rule with the association.

Q. Why do you enter into a contract of that kind with the traveling public in any instance?—A. To protect them. There may be a ticket which was made out to a particular individual, and the railroad conductor might refuse to accept it as fare. So we reverse the ordinary principles of business. If you claim that you are defrauded in a transaction, ordinarily you would have to prove that you had been defrauded. We say that unless the broker has a written agreement to the contrary with his passenger, he, the broker, is responsible for that ticket. It is to meet cases like this that the acts of all ticket brokers in the American Ticket Brokers' Association are absolutely guaranteed to the public. It is to make our patrons feel absolutely fearless in purchasing tickets, and to counteract the influence of the articles the railroads are constantly putting in the papers in an effort to educate the people to be afraid of the ticket broker.

Q. Why do you get tickets for which you do not care to assume responsibility, and put that responsibility on the traveler?—A. I have never, in my own experience, sold a ticket of a character that I was not willing to assume responsibility for. I do not think that in the 19 years of the existence of my office in Detroit there has ever been a transaction of that kind; but that is a rule, one of the rules of the association.

(A VOICE.) There is a question here I think you are not quite clear on. The by-law is not intended to mean that the broker is not responsible for the amount of money that the passenger pays for tickets. It is only intended to show to the executive committee, who arbitrate these cases between passenger and broker, that he is not permitted to receive any more money than the amount of money

paid. In no instance do we sell a ticket with any kind of a contract that he assumes any more risk than the amount of money he pays.

Q. (By Mr. A. L. HARRIS.) Do you accept that as your testimony?—A. Yes. In this way; our guaranty is this: Suppose you buy a ticket of me for \$8; the regular fare is \$10; the ticket is refused; I am compelled by the rules of our association to make you whole. I pay \$10—not \$8 that you pay me—and I have no recourse. If I refuse to do it and the passenger appeals to the association, unless I have this written contract with the passenger that he will take that ticket and assume his own responsibility, I must refund the \$10.

Q. (By Mr. LITCHMAN.) As I understand it, the point of the question of Mr. Kennedy is whether it is your usual custom to ask for a contract of that kind?—A. I never did so in my life.

Q. (By Mr. KENNEDY.) Can you give the names of any men who are now prominent in railway management or the railway business, who have gone up from brokers' offices?—A. I could do so, but I would rather not do it, from the fact that they might imagine it would lower their dignity and might feel offended. I know of a very popular traffic manager who commenced his career in a ticket broker's office, a gentleman who has a record, from the time he was a boy until he grew up to manhood, of strict integrity, and he is not an enemy to-day of the ticket broker. One of the commissioners, whose name is known the world over, got his first education in the office of one of the ticket brokers here to-day.

Q. Interstate Commerce Commissioner, you mean?—A. No, of the railroad commission; not the Industrial Commission or the Interstate Commerce Commission. Although I recall a case—I should not like to produce the contract—but one of the early members of the Interstate Commerce Commission, who spoke very bitterly of ticket brokerage, or at least the reports say so, did make a contract with me shortly before he was made a member of the commission for a large block of tickets, and I was to sell them at a specified rate. The contract was signed by his successor, and the tickets were not turned over until after he became a member of the commission. I suppose the number would run into the hundreds—railroad men occupying high positions to-day, at least positions of trust and responsibility, who worked for brokers. It is very common for men to leave the railway service and work for a broker, and then go back to the railway service. In fact, work in a broker's office is an education which makes a man valuable for the ticket business. He gets familiar with every form of ticket issued, and the different lines of railroads in the United States, the railway connections, and everything of that kind.

Q. How do your members view the movement which is now going on among the railroads of the United States looking toward what some of them call community of interest?—A. We think that if those schemes are carried out that they will destroy our business. We are in business not from sentiment, but to make money in an honorable way. When in the course of business any combinations that are honorably and legally formed put us out of business, we will make no complaint; we will go down; we will rise or go down as the situation may be brought about; but what we do object to is to be stigmatized as doing an illegitimate and dishonorable business.

Q. Do you believe that so long as there shall be competition in railway passenger traffic there will be room for the brokers?—A. As long as there is competition there is room for brokers. There is this about it: The broker thrives best when trade is bad and when rates are high. When people are making money they don't care so much—the savings effected through brokers do not amount to so much to them; they are not so anxious to buy. When the railroads are doing lots of business they do not care for us. But when the railroad companies get in a close place and need business—it is like any other business—they get out and look for it, and the ticket broker is in a position to give it to them.

Q. This is one business, then, that does not thrive on prosperity?—A. Not so much so.

Q. Have you any written contract made between ticket brokers and railroad officials for the selling of cut-rate tickets in bulk?—A. They could be procured, but it would be a violation of a business agreement, and something that we should greatly hesitate to do. We do not think it would be right to do it.

Q. (By Mr. LITCHMAN.) You are sure that such things exist?—A. Such things exist. I am willing to say that on my oath.

Q. (By Mr. KENNEDY.) And you could furnish them if you were inclined to?—A. I suppose it would be possible. I would not like to say that we will do it. I will say this, in regard to contracts of late years, that it is a matter of honor between the ticket broker and railroad men. For instance, a ticket broker may write to a general passenger agent that he wants something, that he can do him

some good, and instead of getting a reply by mail a district passenger agent or a traveling passenger agent comes in and talks the matter over and says, "We will do so and so;" and that contract stands. The agent will say, "Buy tickets reading over our road, report to us the forms and numbers at the end of the month, and a check will follow." That is the general custom of doing business, and, to the credit of the roads, there are very few instances on record where the contract has been violated to the slightest extent.

Q. Would you mind furnishing such a contract for publication in your testimony if the commission were to omit the names?—A. Contract for the sale of tickets?

Q. Yes.—A. Personally I might not object to show the one in which the commissioner was interested, but I believe that even in that case I might be condemned by the ticket brokers of the United States as violating a confidence.

Q. I will not press it, then.—A. When prominent railroad men who have dealt with us come before this commission, or a commission of this character, and give testimony derogatory to the ticket brokers, there is a great temptation to get back at them. When, as I have mentioned here, a member of the Interstate Commerce Commission—one of the early members—attacked us, I felt very bitter when I had in my hands the contract from the road that he represented, and the arrangement had been made before he left the road. I felt like showing him up, but I never have.

Q. (By Mr. LITCHMAN.) It is a fact, then, that the officers of railroad lines find it expedient and profitable at times to deal with the Ticket Brokers' Association?—A. We proved before the Committee on Interstate Commerce in the Senate that 95 per cent of the business of the ticket brokers in the United States was done with the railroads direct.

Q. And yet, when they want legislation from Congress, they turn around and denounce your association as dishonest. Is that right?—A. There were just two cases shown up in that testimony before the Senate committee by Mr. George M. McKenzie. The Pennsylvania Company, represented by Mr. Boyd, was one of our bitterest enemies. The New York Central, through Mr. Daniels, was also exceedingly bitter against the brokers. Mr. McKenzie, to defend himself, showed (and the testimony is in the records of that hearing) that the Pennsylvania Company had dealt through brokers to the extent of tens of thousands of dollars. The canceled checks paid by brokers and returned to them through the banks and indorsed by the railroads' treasurers were shown to prove dealings with brokers by the New York Central (and some of the gentlemen are present who drew those checks). The checks were for tickets over the West Shore road, owned by the New York Central, and they showed the indorsement of the treasurer of the New York Central.

Q. (By Mr. KENNEDY.) What proportion of your business can you say now comes to you through the railroad officials?—A. The statement of Mr. McKenzie was 95 per cent. Now, when we say 95 per cent of our tickets were bought directly from the railroads I do not mean that each individual broker buys all his tickets from the railroads. For instance, some broker at a starting point East, New York or Boston, starts that ticket West. It may travel from New York to San Francisco, but it was originally purchased from the railroad direct by the broker, and is used from point to point.

Q. Have you any idea what proportion of your business now comes from the railroads?—A. Well, there is a less proportion, especially in the last year, when the traffic associations are the whole thing.

Q. Could you keep open your ticket offices and do business and make a living without the trade which you get through the railroad officials?—A. No; I do not think so, to anything like the extent to which the business was formerly conducted. Where a broker would have perhaps anywhere from thirty, fifty, to a hundred thousand dollars invested in stock, he would necessarily have to do the comparatively small business that is done through tickets that passengers don't use and through excursion business, and of course that would greatly injure the advantages the public now enjoy, because when a broker is doing a thriving business he can buy almost any quantity offered of these tickets by passengers, and he can depend on a large sale to his customers. If the trade is restricted and he can't buy of the railroads, he has got to take some other line in with his ticket business, and perhaps take a less public location. He would not have the same facilities for handling tickets, and of course he would not be in position to handle a large amount of stock.

Q. If you are doing business in Washington, and a gentleman comes to you and says he desires to travel to Chicago, and wants to know what you will make him a rate to Chicago for, and you tell him that you will buy a ticket for Omaha or

some point farther West, and give him an order on a Chicago broker to buy the unused portion of that ticket—is that a common practice?—A. It is a very common way. That is what is called “scalping” a ticket—buying to some through point, which is perhaps a competitive point, and upon which very likely some one of the various roads in this line are anxious for business, and will pay a commission. We sell the passenger the through ticket and give him a rebate order on a broker at the intermediate point for which he is bound.

Q. What I wanted to know in that particular instance was this: Do the railroads know generally that those tickets are bought in that way, being purchased by or for a ticket broker or scalper?—A. It is a very difficult thing not to know it, because the broker buys the ticket. They know it, and it is encouraged by the roads. For instance, there may be some road—say some one of the weaker lines—from, we will say, Buffalo to Chicago, that wants business. The passenger agent of that road comes to a broker and says, “Try and induce your Eastern correspondents or Western correspondents to send their business our way; get the business over our road, and if any tickets expire we will extend the limits.” Sometimes they pay a commission and sometimes they do not.

Q. Do the traveling men of the United States, those who are known as traveling men of business houses, patronize your members to any considerable extent now?—A. I think that every organization of traveling men, every organization that I know of, has adopted resolutions denouncing the antiscalping bill, and is in favor of the broker.

Q. Have the railroad companies recently made concessions to traveling men in any way?—A. In the way I have explained—in the interchangeable book. Where these books are sold, it may be of more advantage to the traveling man to buy the interchangeable book than to deal with brokers, as he gets a net rate of 2 cents.

By the way, this interchangeable book to a great extent is of no particular advantage to the traveling man. When the old custom was in vogue, and each road sold its individual books, a traveling man was allowed by his house 3 cents a mile for travel. He got his mileage from the broker, as a general rule, at about $2\frac{1}{2}$ cents and saved three-fourths of a cent, and that was one of the perquisites of his business. Now, in the territory of these interchangeable books, with a universal rate of 2 cents, he can only put in a bill of 2 cents a mile. The railroad companies can't benefit by it, for the reason that no broker, except in very rare cases, paid them less than 2 cents for mileage. It is the jobbing house that profits by this interchangeable book.

I want to say of this interchangeable book, that while it takes the broker's business from him, we make no complaint. Whenever the railroad companies offer something better to the public than we can give them, we certainly are not coming to a commission to complain nor to Congress to complain, and ask that a law be changed to put business into our hands.

Q. I notice that you have many expired tickets. Do you buy all the tickets that come to you if there is a day or half a day's limit on them?—A. It depends upon circumstances; but as a general rule we do.

Q. Do you lose many of them?—A. We lose enormous numbers of them, but it is good policy for us to buy everything that comes along, because it shows the people that there is a market for tickets, and in the aggregate we make money, of course, or we would not be in the business. Any ticket broker can show you boxes full of expired tickets. We simply buy a ticket as a speculation. If we lose it, why, it is all right; it is a matter of business.

Q. (By Mr. LITCHMAN.) You spoke of selling tickets for the railroad on a commission?—A. Yes.

Q. Would you object to state what the amount of that commission is usually?—A. I think that it is an average of, say, 10 per cent.

Q. Ten per cent of the selling price of the original ticket?—A. About that.

Q. That would be a fair estimate for the whole country?—A. I think so. I guess that is a fair average. It is the same commission, as a general thing, that is paid to agents. A broker is treated usually just as the regular agent is, and if he chooses to divide part of his commission with the passenger, that is between him and the passenger.

Q. Does the use of the interchangeable mileage book, in your judgment, have the approval of the employers of traveling men, as a rule?—A. I should think so. I think they are the ones that profit by it.

Q. You spoke of the fact that the traveling men receive the difference between the cost of the mileage book and the straight 3-cent fare as a perquisite.—A. They did in former times.

Q. Was it not the custom in former times for the employer to furnish the mileage book the same as now?—A. I do not think so to the extent that it is now.

There is one reason why the employer furnishes this book, and that is because it is beyond the means of a great many of the traveling men to put enough money in it. I do not know what amount of money there is invested in these books—the amount of money that the railroad companies have the use of—but this book is No 828028 [referring to book before him], and at \$10 a cover, to say nothing of the mileage inside, it represents an immense sum of money. Of course these are being turned in constantly. It would not be fair to assume that there was about \$3,360,000 out on these books, because a great many of them have been cashed; but there is an enormous sum of money involved. This is only one of at least three in the West. There is, west of Chicago, a different style of book; it is called the Sebastian book. You buy a pocketbook for a dollar or so, and when you buy a ticket of a railroad company you take a receipt and those receipts are registered by the ticket agent and they are filed in the book. When you get up to, say, 2,000 miles you can turn them in and get a rebate. In Michigan there is a kind called the Northern mileage book, controlled by the Northern Mileage Bureau. Another book, known as the Central Passenger Association book, is complained of by traveling men. I am not here to represent traveling men; but there are many restrictions about this book that makes it of great inconvenience to the traveling men, because it is not accepted on the train.

Q. The annoyance of the use of the book at the station?—A. Yes. There is one book that has not this objection—the Northern mileage book, used by the Michigan roads.

Q. Will you kindly explain the manner in which this book is used?—A. To get this book the purchaser writes his name and address and gives it to the ticket agent and pays \$30. There is nothing on this book to identify the original purchaser. When he wishes to travel upon it he goes to the ticket agent, indorses a strip of mileage in this book, and the ticket agent tears out the mileage and gives him a check or a ticket to be used in connection with the book cover. Then he can check his baggage. It is presented to the conductor on the train, who takes this ticket and, I presume, compares it with the mileage book or sees that it does compare with it, and in that way the mileage is used; but, of course, if a man gets to the station close to train time and finds a large number of other mileage holders ahead of him, to get to the ticket agent, go through this complicated system, and get this exchange made, baggage checked, etc., requires considerable time, and frequently he is not able to use the book at all, but has to pay 3-cent fare.

Q. (By Mr. CONGER.) This Northern book you speak of has a different arrangement now, has it not?—A. Yes; I think a much fairer arrangement. It is used like the old mileage book, except that the conductor detaches the mileage and requires the signature of the passenger on a separate slip.

Q. Do you know how that change was brought about; that is, the change in the use of it?—A. I do not. I know that there were a great many traveling men who objected to this style of book, and that passenger men on Michigan railroads believed their objections reasonable and originated a new book.

Q. It is quite likely, then, that the traveling men's association had something to do with it?—A. They may have had something to do with it.

Q. (By Mr. LITCHMAN.) They make a deposit with that book the same as this?—A. Ten dollars; yes.

Q. (By Mr. CONGER.) I would like to ask whether you can tell us if the book in use in Michigan—I think you called it the book issued by the Northern Mileage Bureau—has the official approval of the Traveling Men's Association of Michigan?—A. I can not say positively that it has; I believe it has. I do not believe that any of them like the \$10 cover, however. I know they do not. Nevertheless, it is the best thing that has been offered up to this time.

Q. Is not this interchangeable mileage book an advantage to the travelers in the amount of money they have to invest in mileage books? For instance, if the traveling man with Michigan for his territory, and who would have to travel over, say, 5 different railroads, were to invest in mileage books in the usual way he would have to pay \$100 for 5 books over as many roads, whereas by the purchase of 1 of these interchangeable books he could have a book that would be good over 5 roads for an investment of \$30?—A. I think that is an advantage; an advantage to a man in that position.

Mr. KINNER. Mr. Lindemberger has given much time to our cause and has covered the ground quite thoroughly; but there is just a little thing I would like to answer in regard to the question asked by Mr. Conger. It is to some extent an advantage and in another way a great disadvantage, because in accepting that mileage on the train they will only check baggage to the passenger's destination on that particular line. If they are going to change on another road, they have

got to recheck; they can not check through in a great many instances. I am not in Michigan; but formerly they could check only to the road where they were going to change cars. I know that was in vogue.

The WITNESS. Now, I believe this is obviated in the Michigan book; but in the Central Passenger Association book you can not get a through ticket issued beyond the line of the road that you first ride upon, and you can not check your baggage through; you have to change your ticket and recheck your baggage if you go on another road. This is very disagreeable on a night trip.

Q. (By Mr. CONGER.) I would like to ask a few questions in regard to the complaint that you made as to some of the Michigan roads having practically violated an agreement with you some years ago.—A. Not very long ago.

Q. Family mileage books were in vogue. Was that or was it not brought about by a change in the passenger agents?—A. The passenger agent has since been advanced to larger responsibilities. He is a good fellow yet, but he don't come into my office as he used to.

Q. When these family mileage books were in vogue it was the custom for this railroad to put many names on the book?—A. That was a good deal like the spelling of Sam Weller's name—depended on the taste and fancy of the speller. They put on about as many as the purchaser wanted.

Q. Now, when one of those books was used did not the man who used it have to sign one of the names on the book, whether it was his name or not?—A. That was the requirement, I believe, in the contract.

Q. What was the practice?—A. I believe it was the practice.

Q. Well, isn't there an element of forgery in that?—A. I will tell you: In the first place the tickets were almost universally purchased by brokers, and the broker, in order that the names would not all be the same, asked the first traveler to put his name on the book. The contract, so far as that is concerned, was entirely disregarded. And here is another feature I want to bring out in this contract on railroad tickets. There seems to be a different understanding in relation to this contract—if it is a contract—and to an ordinary business contract. The subject has been brought up or has been suggested to me. If this is a contract, why do not the revenue laws apply to it? In all business contracts the revenue laws require a stamp. You have not seen a stamp on a mileage book, or a railroad ticket.

If this is in the nature of an evasion—the using another person's name—it is the result of an education from the railroad companies, and if there is anything wrong in it the responsibility rests with the railroad companies. I believe the requirement making any person sign a name on a ticket or mileage book is wrong, and it is being discontinued to a certain extent, just as in New England, where the mileage book is now good in the hands of bearer, and while the contract on some of the books sold in that section requires the signature, it is not recognized.

Q. Do you know of any action having been taken by a railroad company, or by anyone in their interest, for forgery against a person who had illegally signed a name on a mileage book?—A. I remember reading of one case in California, where the Southern Pacific Company tried to punish a man for signing a name, and the court decided that the original purchaser in selling that ticket necessarily gave the power of attorney to use his name in that connection to the person to whom he sold it.

Q. What proportion of your business now consists in mileage books, approximately?—A. Personally it amounts to almost nothing since the interchangeable book was put in force. The only business to any extent that is done in mileage is simply buying these books for the use of individual traveling men who can not afford the outlay of money to carry them, and simply charging a percentage on the mileage, he using the book personally. Now, the conditions in my home city are very likely different from what they are in other cities. There are a great many parts of the United States where the old conditions prevail, and the roads issue individual 500 and 1,000 mile books at a flat 2-cent rate.

Q. Do the roads who are issuing these interchangeable books also issue a book of their own?—A. It has been discontinued. The last was within 3 months, I think—by the Grand Trunk Railroad—in our territory.

Q. What proportion of your business 10 years ago consisted in selling and dealing in mileage books?—A. I think 10 years ago it was very largely mileage books.

Q. And those mileage books in a great measure were purchased from the railroads direct?—A. Almost exclusively. In fact, it was dangerous to do otherwise. I would want to know my passenger if I should buy his mileage. I have known cases where a dishonest man would sell his mileage book to a broker, and then go to the company and report it lost, and have it taken up on the train and returned

to him; he was that much ahead and the broker that much out. In buying a ticket or mileage book requiring signature of any person not known to the broker he would have to be assured that everything was all right.

Q. Now, a little while ago you practically declined to give the commission a contract or a copy of a contract between your agency and the railroad company for the sale of books, and the reason, as I understood it, was that it would be a violation of an agreement which you—A. (Interrupting.) Breach of faith.

Q. I want to ask you whether you are not aware or whether it is not a fact that in times past, when these railroads were selling you these books, they by selling them to you at a less rate than the tariff rate—A. (Interrupting.) No; they usually sold to us at tariff rate.

Q. (Continuing.) Or paying you a commission on their sales, were not, as a matter of fact, violating the agreement which they had entered into with other roads?—A. I do not know as to that. The agreements they make with other roads, I understand, are unlawful, and they might object to show up; they might have a greater objection to showing that up than I would have, because my acts with the roads were not unlawful, but a combine in restraint of trade is unlawful. But then a great many of those transactions were in the days before the Interstate Commerce Commission was organized.

Q. The point I am getting at is this: Whether there was any difference from a moral standpoint, from your point of view, between breaking your agreement with the roads yourself or helping one road to break its agreement with another road?—A. I do not believe these agreements with other roads are right.

Q. Hence you feel justified in being a party to assisting a road to break its agreement?—A. You may say it is a rule more honored in the breach than in the observance.

Q. You afterwards touched on equality of freight rates, and, as I remember, expressed an opinion that they were justifiable and desirable to the public.—A. I say it might be argued that they were.

Q. Would it not be desirable from the standpoint of the public to have an equality of passenger rates?—A. Well, it is the inequality and discrimination in the passenger business that gives the broker his business. If the roads treated the public with exact and equal justice, there would be no room for ticket brokers.

Q. Would not the universal rate of 2 cents a mile bring it about?—A. It would absolutely destroy the brokers' business. When roads make no discriminations to individuals or companies there is no business for the ticket brokers.

Q. And there would not be enough to keep ticket brokers' offices?—A. No.

Q. From the standpoint of the legislator, then, who desires to serve the public primarily, and incidentally to abolish the ticket broker, if he would legislate so as to bring about a universal rate of 2 cents per mile, he would accomplish his object?—A. Yes; the ticket brokerage business would be unprofitable. The broker is a creature of conditions.

Q. (By Mr. FARQUHAR.) I would like to know if it has ever been decided in law whether when a person buys a ticket of a railroad, the railroad being a common carrier, the purchaser of that ticket makes a contract?—A. I don't think so. I do not believe that everything that railroads print upon railroad tickets is a contract—that all the conditions could be enforced. You will see it on almost every railroad ticket, the statement that the railroad will be responsible for only a certain amount of baggage. That wouldn't hold in law. There is frequently on tickets issued by some companies a caution in big letters warning the passenger that anyone who attempts to use that ticket other than the original purchaser is liable to prosecution for forgery. There is nothing in that; it is simply a falsehood.

Q. Do you know whether there has ever been a test in law of a case where a person has been prosecuted for signing the name of another on a ticket?—A. I have referred to one case; I have not the records of it, but I remember of this California case, where the Southern Pacific attempted to prosecute a man for such an act. But this is certain, that if the signing of another person's name on a ticket could subject the person so doing to successful prosecution for forgery, it would have been done hundreds of times in the past few years, while certain railroads, or certain combinations of railroads, have been trying to destroy the broker. There is this about it: I do not suppose there is a broker here to-day—I do not know that there is a broker now in the American Ticket Brokers' Association—that was ever arrested and charged with fraud. I never was. I never had the least intimation made that I had handled anything improper. I do not know of any present member of the association ever being charged with fraud, let alone being convicted. I know of cases where we have expelled members because we became satisfied they had been doing an illegitimate business.

Q. Of course a railroad is a common carrier, and they have on the face or back of their tickets certain conditions that you say are illegal. There is a condition on all common carriers, is there not, under the common law, that they shall carry safely to their destination the parties who have purchased tickets?—A. I think it would be more correct to say the "parties holding" than the party purchasing.

Q. The railroad sells a ticket to a man. The contract is with him. He does not use it, but sells it to another man, who uses it. Now, would the railroad be responsible to the latter for an injury to limb or life, if it were known that he had not bought the ticket from the railroad in the first instance? I want to know what your experience and the experience of your friends has been when the law was brought up.—A. I never have known where a passenger that rode upon one of those tickets was injured and that question was brought up. My opinion is that the railroad company is responsible for an injury to a person even if he carries a complimentary pass upon which there is an agreement that a railroad would not be responsible and the party has signed it.

Q. If the ticket says on its face that it is not transferable, do you think that the second party that holds it and uses it can sue the railroad for damages?—A. I believe so, under all rules of right and reason. I do not know what the technicalities of the law might say in regard to it. I believe when a railroad company sells a ticket, accepts the price from anyone who will buy, that then its business is to transport a passenger on that ticket to his final destination, and not to question what particular person holds that ticket. Tickets are sold to anybody, without regard to weight, complexion, or nationality.

Q. So that you do not know that the question has ever been brought up in law on the nontransferability of a ticket?—A. I remember I was interested in reading something in the printed proceedings of this commission. Some railroad president was asked that same question, and he was much better qualified to answer than I. He seemed to be a little hazy on that proposition.

Q. You mentioned incidentally in your testimony the licensing by national or State governments of ticket brokers. Do you know of any case where private business is licensed by nation or State?—A. I see Mr. Lansing nods his head. Perhaps he can answer that for me.

Mr. LANSING. Yes; express companies are licensed in Savannah, Ga., and in Augusta, Ga. In fact, all lines of business are licensed.

Q. (By Mr. KENNEDY.) I have a few questions that have been handed me to ask Mr. Lindenberger. Are there any restrictions in the sale of immigrant tickets—that is the cheapest class of tickets—with regard to time and accommodation?—A. I do not know as to that. It has not come in my experience. I know this, now that you are speaking of immigrant tickets, that a European immigrant gets a cheaper rate in the United States than an American citizen; that the rates will be from \$2 to \$5, perhaps, from New York or the landing point in America, to his destination, less than American citizens can get.

Q. Those tickets are sold in Europe?—A. They may be prepaid in America. But the ticket which an ordinary American citizen and a voter can get for, say, \$18 can be had by the foreign immigrant for \$15.

Q. That is universal?

Mr. LANSING. The business in Atlantic ports is so controlled by a pool that no person other than one who has arrived from some foreign port can buy an immigrant ticket. If he has been here over 2 weeks, then he is debarred from purchasing an immigrant ticket. And his name must appear on the manifest of some steamship company. But the immigrant fares have been raised within the last 2 years about 20 per cent. Within the last 8 years there has been no discovery of any transaction in which ticket brokers have been engaged in handling immigrant tickets. That has been confined to a different kind of people—men who make a specialty of selling land and looking after the interests of foreigners.

Q. (By Mr. LITCHMAN.) Touch a little on the difference in accommodations.

Mr. LANSING. Yes; the accommodation of the immigrant passengers has somewhat changed within the last few years. They do not run as many immigrant trains as they did heretofore; they hitch them onto some freight train, which reduces the cost of transportation considerably. But in many instances the immigrant who pays \$2 or \$3 or even in some cases as much as \$5 less rides side by side with an American citizen who has paid a higher amount, simply because the railways control in a pool organization all the immigrant business of this country.

Mr. A. L. HARRIS. You accept this now as your testimony?

The WITNESS. I do. I want to say in connection with that statement that immigrants ride in the same car, or perhaps in the same seat, with American citizens that pay a higher rate of fare; that in a great many cases in this country to-day,

where second-class rates have not been abolished, roads have stopped using second-class cars or making any distinction in class, and that two passengers will ride side by side, one paying the first-class rate and one the second-class rate—a difference, perhaps, of \$2—and have exactly the same accommodations.

Q. (By Mr. FARQUHAR.) Do not some of the roads that carry the immigrants on through rates let them ride in the smoker?—A. The smoker is not second class; a railroad company can not force a second-class passenger to ride in a smoker; in fact, they can keep him from doing so. As a general thing, to-day the first-class man that smokes has a right to the smoker and he is not compelled to go into a second-class car to smoke. I know of roads running reclining-chair cars; they are first class; the holders of second-class tickets have the same rights as the holders of first-class tickets right from the railroad companies. The person who knows his business buys a second-class ticket and saves the difference. There is only this difference, that a second-class ticket will not be accepted for a sleeping car; if he wants to ride at night he will have to have a first-class ticket and pay the sleeping-car fare difference.

Speaking of sleeping cars reminds me of the experience of one of the brokers present coming from Chicago to Washington. The usual rate for a sleeper is \$5. He bought his to Pittsburgh for \$2.50; then from Pittsburgh to Washington for \$2. By buying two tickets he got here for \$4.50; if he had bought a through ticket he would have had to pay \$5. Those conditions obtain in many cases in ticket as well as in sleeper rates, and where brokers know of it they advise their customers and make a saving to them.

Q. (By Mr. FARQUHAR.) Do you think that the Wabash, which you know well, does not run second-class passengers in the smokers?—A. I never knew of a passenger on the Wabash being obliged to go into the smoker. I think the gentlemen present will bear me out that a second-class passenger can not be compelled to go into the smoker; that a smoker is not second class. It is a common thing, when our customers come in, for us to say, "Are you going to take a sleeper?" "No." "Buy second-class; get the same accommodation and it is a saving of \$2."

Q. (By Mr. CONGER.) You buy a second-class ticket and sell it to them as first-class fare?—A. Oh, no. [Laughter.] We sell a great many tickets at tariff. We brokers all have a large business. The railroad companies may be in an agreement not to cut rates. They say, We are perfectly willing to pay you a commission, but the rate is not to be cut. We work for them and get business. Our passengers, a great many of them, are our friends that we have known for years. They say, We would rather buy of you than the other fellow if you can make the same rate. There is a great deal of trade of that kind. If there should be a regulation that all tickets must be sold at tariff rates, it would not destroy the brokers' offices. The passenger associations now say how many outside offices a railroad may have. They say to the general passenger agent, You must take your office out of that place or out of this hotel. If an antiscaiping law were passed, and a man could not sell tickets without a certificate, the passenger associations would control the business entirely. But without the certificate they can not control us. We can sell tickets against anybody, even if it is necessary to sell at tariff rates. But if a law is passed making it criminal for any man to sell them without a railroad certificate, they would restrain that man from selling a ticket and close his office.

Q. (By Mr. KENNEDY.) What percentage of the members of your organization have been in the brokerage business 10 years or more?

Mr. CARTER. Between 65 and 70 per cent.

The WITNESS. Mr. Carter says between 65 and 70 per cent.

Q. And you say none of these gentlemen have ever been charged with or ever been convicted of fraud?—A. I think our secretary, Mr. Carter, will know, and I will let him answer for me. He will know whether any person whom we have permitted to remain in our association was ever charged with or convicted of fraud.

Mr. CARTER. No, not once.

Q. What position have ticket brokers occupied politically and socially, so far as you know?—A. A few of us have been sentenced to State legislatures or something of that kind, but ticket brokers as a general thing are business men and not office seekers.

Q. Were you ever a member of a legislature?—A. I have been a member of the California legislature. We are business men and pay very little attention to local politics, and I should think it would be a rare thing to find any of us engaged in ward politics in the cities in which we live.

It is true that ticket brokers have served as councilmen and aldermen of cities and were honored members of those bodies, but as an association we are not a

political body. But ticket brokers are wide-awake citizens; they take a lively interest in all public matters, but I mean they are not politicians to the extent of seeking political preferment and political positions.

Q. Can you tell us something about the classes of people who effect a saving by patronizing ticket brokers, other than the traveling men you spoke of? Are they more generally laboring people or middle-class people, or is it true of all classes of people?—A. I should say they were from all classes. I think in my own city there is hardly any class of people, excepting those who can go to a railroad and get a pass, but what deal with the ticket brokers. We have sold to United States Senators, Congressmen, governors, judges, ministers of the gospel, officers of the Army, doctors, merchants, and business men, as well as to the great masses of the people in more humble walks of life; even railroad employees are among our customers. Of late years the roads have been drawing the lines and making it difficult for men in the lower positions of railroad employment to get free transportation or even special rates. A great many of them have come to us. Men employed on the passenger trains, knowing of the honorable character of ticket brokers, frequently recommended their friends to come to us because they knew that whatever we sell would be all right.

Mr. LANSING. It is not an infrequent occurrence for poor people in Eastern cities, particularly New York, to deposit week by week or month by month a small sum to buy tickets West, or buy tickets for some one in the West to come East, or from the South to come North, and the saving through the ticket broker often means a day's wages or 10 or 12 hours' work to a workingman. And again, in the cities where merchants and small tradesmen from the West and South come on to buy goods the wholesale houses, knowing that these men do not buy very extensively and do not ship very largely, and so are unable to get any consideration in the shape of passes or half-rate transportation from the railway companies, seek out the ticket broker and get the small tradesmen, the buyer, the crossroads grocer, and similar people something cheap from the ticket broker. It saves them a dollar or two. In the country, down in Kentucky and Tennessee and Missouri, a dollar is bigger than it is in New York and the big cities. Those men will walk five or six blocks and wait over a day or two to save a dollar on a ticket. Those are only the wage-earners and frugal people. I have talked with our Eastern people, and a great many find that men who are well to do and who are frugal save money by patronizing brokers. They do not always expect to save money simply on a ticket, but they hope to save it by getting some information about some route that a railway company does not inform them about. Each railway office only informs the passenger about its own particular line, whereas in a ticket broker's office the passenger is informed about the various lines—eight or nine of them in some instances—to a given place; and by that means the passenger is saved a great deal of tramping over the city, a great deal of time, and he knows that the information is correct, and he selects his route and makes a saving in money without any sacrifice of comfort.

Q. (By Mr. KENNEDY.) Mr. Lindenberger, you said something about selling railroad passes. If a man should come into your office in Detroit and offer to sell a railroad pass, would you take forcible possession of that pass and send it to the railroad or would you inform the railroad that such a pass had been offered for sale?—A. I have frequently done so, but of late years I prefer not to see the pass. If a man should offer to sell me a pass, I would say: "We do not handle them; I do not want to see it." Sometimes some very painful results grow out of reporting passes. I remember hearing one of my friends tell of the custom that he had, in common with other brokers, of reporting passes. He reported a pass that was offered for sale. It proved to have been given by a general passenger agent to a young man who was a friend of his family and whom he was trying to assist in getting something to do. And the fact that that young man had offered the pass for sale—had violated his confidence—hurt him so badly that he said: "I am very much obliged to you all right enough, but I am very sorry to know this thing. I would very gladly have known nothing about it." And it affected the broker so much that he said: "Hereafter I will just let those things go." And I have had something of the same experience. Most of the passenger agents simply ignore our advice, and say: "Oh, well, that scalper is trying to curry favor with the road and is trying to make something out of it." But I never buy a pass, and I never have sold one nor permitted one to be sold in my office. It is disreputable and dishonorable. While railroad companies may issue passes improperly, for political purposes or otherwise, it does not justify brokers in handling them. We confine our operations to tickets that the railroad company receives its price for. Such tickets I believe to be proper articles for sale, notwithstanding the fact that John Jones or Tom Smith may have been compelled to sign them.

Here is a point that might be of interest. The total amount of passenger revenue during the past five years amounted to \$1,250,000,000. The amount of fraudulent tickets during that period could not possibly exceed \$10,000. Of course I am not in the fraudulent-ticket business, and I do not know what it could amount to; but I know this: That with the system of espionage that is exercised by the traffic associations and railways by the spotters who are paid to get information—and I think are sometimes inclined to manufacture it—certainly our enemies, if they had information of that kind, would present it; and from that I judge that the loss to railroads in fraudulent tickets must be an exceedingly small fraction of the whole amount of business done. Take these limited tickets. While the railroad companies have been paid for them, it is of course a fraud upon the road and a dishonest act to extend the limits upon them. And yet most of the fraudulent tickets are extensions of the limit, or the using of these tickets outside of the proper agreement; so that as a matter of fact the railroads have actually been paid for carrying the passenger. Of course that is no excuse for the ticket being used. But I think that we can safely say that the value of fraudulent tickets that the railroads carry passengers upon, for which they receive no compensation, is very small indeed. Ticket frauds have been usually discovered through brokers. Recently a forged ticket was discovered, reading from Eastern cities to Colorado. It was an actual forgery, discovered by a broker. The broker is present. He notified the railroads, and the rascals were caught. The brokers gave every information possible, and the forgers are serving, and very properly serving, a term in the penitentiary.

I have something here that might interest the commission. I spoke in my testimony of our correction sheet that is issued twice a month from the secretary's office in Louisville, Ky. Among the standing instructions on that sheet is the following [reading]:

"Lost, stolen, and fraudulent tickets. Members will report to the general office all lost, fraudulent, and stolen tickets, in conformity with article 15. This rule is mandatory, and failure to comply is punishable by fine."

(The witness then read the remainder of the article, instructing brokers how to proceed upon the presentation at their counters of fraudulent tickets.)

Q. (By Mr. LITCHMAN.) And then follows a list for that particular month?—A. Yes. Now, it has been the custom with railroad companies, and is really the most effectual way of detecting frauds, burglaries, etc., as soon as they learn of a fraudulent issue of tickets or of tickets being stolen, to notify a broker, who in turn notifies our secretary. That information is wired all over the country or goes by the first mail, so that every ticket broker in the United States is on the lookout for those tickets; and no fraud can long continue, because the party will be caught.

Mr. FRANK. With your permission, I should like to say a few words.

Mr. A. L. HARRIS. All testimony will have to be sworn to, and if you appear as a witness you will have to take the oath. If Mr. Lindemberger, however, will accept your testimony as his, it will be all right.

The WITNESS. If I object to it, I will say so and have it straightened out.

Mr. FRANK. To show how impossible it is for fraudulent tickets to be accepted on a road for any length of time without the consent of the auditing department, a ticket presented on a train to-day is turned in by the conductor to the auditing department, say, to-morrow or next day—to-morrow, as a rule—the moment he finishes his trip; and by the next day it is checked up, so that it would be only a matter of one or two days that a fraud could continue without being discovered. All the brokers in this room have averaged in the business over 15 years. There is not one of us that has ever been arrested, or ever suspected, even, of selling a ticket that was connected with fraud. There is less chance of fraudulent tickets being accepted by a railroad than of almost any other kind of fraud being perpetrated on a railroad or bank or any other institution.

The WITNESS. Here is a clipping from the Dallas Herald, which was copied from the Chicago papers and published for an object all over the country, that I want to lay before the commission. [Reading:]

RAILROADS DISTRIBUTING INFORMATION ON TICKET SCALPING.

Under the heading of "Warning to the public," the railroads are sending out copies of the following article, which recently appeared in the Rochester Herald:

"The railroads are thoroughly in earnest in their purpose to put an end to the ticket-scalping business, and a few incidents such as took place in Chicago the other day will be sufficient warning to the traveling public that it can not hope to successfully defy the contract under which it secures reduced rates of transportation. The story as we have it from a Chicago newspaper is an interesting one.

"A man and his wife, whose home appeared to have been in the Windy City, bought for \$16 two tickets, valued in the regular way at twice that sum, and returned home with the crowds which

were flocking in to attend the corner-stone laying. The contract required the deposit of the tickets at the arrival station, and they did this, but returned the next day to inquire when they could secure possession of them again, but were told that they would be ready for them in ample time to catch their train for home.

"Saturday the man and wife called for their tickets and were told that they could secure them at the train. They said they wished to take them Saturday evening. The man made quite a disturbance, but the clerk was firm, and so the couple left and returned with an officer and warrant from Justice Martin's court and arrested the clerk. Commissioner Donald, of the association, went to Justice Martin's court, and the case was immediately called and dismissed, as the judge said he thought the offer of the agency was fair in any event, as the couple said they wished to go by the evening train and were promised their tickets in ample time.

"Three association men went to the train and found the couple waiting. One man remained near by, while the other two handed the tickets over and left. Immediately after the two men left the couple were joined by a man and woman, to whom the tickets were turned over and their baggage checked to Cincinnati. The conductor was notified, and the tickets were taken up before the train reached Forty-seventh street, where the purchasers preferred leaving the train to paying their fare down to Ohio.

"This is the first instance of the kind that has come to public notice, and it would seem that the railroad company acted within its moral and legal rights. The selling of a ticket at a largely reduced rate is a favor to the traveling public, which the carrier has a right to keep from being abused. If it lacks this power, its only recourse is to withdraw such tickets from sale, which would be a hardship to that class of persons who can take these pleasure jaunts only by the favors which they receive from the railroads in the matter of reduced rates. It was no hardship to the original purchaser in this particular instance, as he went into the speculation with his eyes fully open to the consequences of failure, but it was a humiliation and annoyance to the scalper's customer, which might have been avoided by a little closer observation of the code of honor on both sides."

In this article I do not see where they can connect the ticket broker with the transaction. It appears that the couple bought round-trip tickets from where they started to Chicago and return, found another couple who were going back to this place, and desired to turn these tickets over to them. The railroad put their spotters on them. They go and sign these tickets, and the tickets are taken up and the people ejected from the train. Now, I believe that that sort of proposition is wrong. It may be contended that when these parties bought these tickets to Chicago and return they became parties to a contract and should comply with all the requirements of the contract, but I believe that when a railroad company sells a ticket it is good to carry a passenger, and as they sell that ticket to anyone that will buy it, it was a perfectly proper transaction for this couple to turn their tickets over to any other couple who would return on the journey. There is nothing of this kind that happens in the United States where a ticket is refused but the "scalper" is blamed for it, and this, of course, is a specimen. I believe it is wrong.

I remember a case, too, where a great deal was said in the newspapers about what they were pleased to term a rascally trick by a scalper to beat the railroad company. From some place out of Chicago, perhaps a hundred miles, there was an excursion rate advertised of a round trip. A Chicago broker organized a company of people, paid the local fare for his party on the train to this point, and got off the train to buy the round-trip tickets. The passenger agent of the road had learned of it, wired to the conductor to shorten the time at this station, who whipped away before the broker had time to buy his tickets. The broker was compelled on the train to pay the local fare for his entire party. This transaction was bulletined in the papers as a proper way for the railroad company to beat the broker and punish him for the very improper act of selling to his party at the full excursion rate that the railroad company had advertised in this place, some little distance from Chicago.

(Testimony closed.)

WASHINGTON, D. C., January 19, 1901.

TESTIMONY OF MR. A. K. TEISBERG,

Secretary of the State Railroad and Warehouse Commission of Minnesota.

The commission met at 10.10 a. m., Vice-Chairman Phillips presiding. Mr. A. K. Teisberg, of St. Paul, Minn., secretary of the railroad and warehouse commission of the State of Minnesota, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. PHILLIPS.) Mr. Teisberg, will you please give us your residence?—A. Since I became connected with the State railroad commission of Minnesota I have resided in St. Paul. I have been connected with that commission since its creation in 1885, and since 1890 I have been its secretary.

Q. What was your occupation?—A. Formerly I was assistant secretary of the commission.

Q. What was your occupation prior to that?—A. A little prior to that I was a newspaper editor and publisher. Prior to that I was engaged in teaching at college, particularly languages.

Q. Will you please state the duties and powers of your commission?—A. The law adopted by the legislature in 1885 creating the railroad and warehouse commission did not give the commission power directly to fix rates, but the commission was rather what is called an advisory commission. They could recommend to the railways any changes that they thought proper. That law, however, was superseded in 1887 by an act, chapter 10, general laws of the State of Minnesota, which was based upon the act proposed to regulate interstate commerce. My recollection is that such an act was drafted some time in the latter part of 1886 and sent around to the various State commissions, and our commission took the matter up and recommended to the legislature a change of the law in accordance with that act. The greater portion of it is exactly in the same words as the interstate commerce act, as adopted in 1887. There are some exceptions, one of which is that the State act permits the railroad to issue free passes to whomsoever it pleases within the State, good within the State, while, on the other hand, the original act prohibited the railroads from granting clergymen's half-fare permits. That, however, was changed at the following session, so that now any railroad in our State can grant half-fare permits the same as they do in a great many of the other States.

The commission, by this act of 1887, was also empowered to fix or to change rates made by the railroads, and they proceeded to do so with reference to the switching rates at Minneapolis and with reference to rates for the transportation of milk from certain points on the Chicago, Milwaukee and St. Paul Railway. They reduced the switching rate from \$1.50 to \$2 per car to \$1 per car. They reduced the rate on milk from 3 cents per 10 gallons to 2½ cents per 10 gallons for distances up to 75 miles.

Q. (By Mr. FARQUHAR.) These arrangements were within the State of Minnesota?—A. Entirely so.

Q. So that there was no interference with the interstate-commerce act?—A. No. Now, the railways did not obey the order of the commission in these two cases, so mandamus proceedings were instituted. The State court sustained the commission and asserted that the commission had full power to fix those rates. The companies appealed to the United States Supreme Court, where the decision of the State court was overruled and the law as defined by the State court was declared unconstitutional in the case of the Chicago, Milwaukee and St. Paul Railway Company, plaintiff in error, v. the State of Minnesota ex rel. the Railroad and Warehouse Commission of the State of Minnesota, familiarly known as the milk-rate case.

Q. (By Mr. LITCHMAN.) Can you briefly give the grounds of that decision?—A. I think I shall do that in the language of the court. The United States Supreme Court says:

[Reading:] "The construction put upon the statute by the supreme court of Minnesota must be accepted by this court, for the purposes of the present case, as conclusive and not to be reexamined here as to its propriety or accuracy. The supreme court authoritatively declares that it is the expressed intention of the legislature of Minnesota, by the statute, that the rates recommended and published by the commission, if it proceeds in the manner pointed out by the act, are not simply advisory, nor merely prima facie equal and reasonable, but final and conclusive as to what are equal and reasonable charges; that the law neither contemplates nor allows any issue to be made or inquiry to be had as to their equality or reasonableness in fact; that under the statute the rates published by the commission are the only ones that are lawful, and, therefore, in contemplation of law the only ones that are equal and reasonable; and that in a proceeding for a mandamus under the statute, there is no fact to traverse except the violation of law, in not complying with the recommendations of the commission. In other words, although the railroad company is forbidden to establish rates that are not equal and reasonable, there is no power in the courts to stay the hands of the commission if it chooses to establish rates that are unequal and unreasonable.

"This being the construction of the statute by which we are bound in considering the present case, we are of the opinion that, so construed, it conflicts with the Constitution of the United States in the particulars complained of by the railroad company. It deprives the company of its right to a judicial investigation, by due process of law, under the forms and with the machinery provided by the wisdom of the successive ages for the investigation judicially of the truth of a matter in

controversy, and substitutes therefor, as an absolute finality, the action of a railroad commission which, in view of the powers conceded to it by the State court, can not be regarded as clothed with judicial functions or possessing the machinery of a court of justice."

Briefly stated, the law was set aside for the reason that it did not provide for a judicial review of the acts of the commission.

Q. (By Mr. FARQUHAR.) In other words, that it was arbitrary in rates and in jurisdiction?—A. Yes; I may state, however, that there were three justices of the Supreme Court that dissented from the majority opinion in this case.

This decision was rendered in 1889 or 1890 and the following session the legislature, which met in 1891, proceeded immediately to amend the law upon the lines laid down by this decision so as to meet the objections, and under that law, as amended, which provided for complaints being made, duly verified, by any person or corporation or municipality in regard to rates, the commission should proceed to investigate and give the companies due notice and proceed, as near as may be, in the manner pursued in such cases in a court—take testimony, consider all the facts submitted to it, and then render its decisions.

The first and perhaps the most important case that came before the commission under that amended law was the question of grain rates from points in the Red River Valley, the northwestern part of Minnesota, to Minneapolis and Duluth, our chief grain markets.

The complaint in that case was filed in the latter part of 1893. In 1894 the commission made its order reducing the rate about 12½ per cent. The complaint demanded a reduction of 33½ per cent. The complaint covered only three stations, but in making the order the commission felt that if it should simply make an order with reference to three stations it would make a tariff which would be discriminating as to a great many and perhaps all other points on the road, so the commission made a rate covering the whole road. The railway company appealed to the district court where the case under our law was tried *de novo*. The same testimony was introduced before the court as before the commission, and some new and more complete testimony was introduced. The line upon which this case was tried, on the part of the State, was to show the cost of reproducing the railroad, and, taking the earnings of the road for a series of the past four or five years—its earnings upon the grain traffic, which was the only traffic involved in the controversy—by these means to arrive at a fair income for the railroad within that State upon the cash basis of the cost of reproducing that road at that time. The decision of the district court was adverse to the commission. The case was appealed to the State supreme court and was decided by that court in October, 1896. The title of the case is *In re appeal of the Great Northern Railway Company, Elias Steenerson, State of Minnesota et al., appellants, v. Great Northern Railway Company, respondent*. The supreme court of the State reversed the district court, and I can probably best express the point decided by quoting a part of the syllabus of the case:

[Reading:] "2. The question whether the rates for transportation fixed by the State railroad and warehouse commission are unreasonable and confiscatory is not determined by the fact that the income under the rates as so fixed will not pay the amount of the fixed charges of the railroad; neither can the amount at which the railroad sold years ago on mortgage foreclosure sale be taken as the basis on which to determine what are reasonable rates, but that question is determined by ascertaining what, under all the circumstances, is a reasonable income on the cost of reproducing the road at the present time.

"3. Under chapter 10, General Laws, 1887, as amended by chapter 106, Laws of 1891, the burden is on the railroad company to show that the rates fixed by the commission are unreasonable.

"4. *Held*, the fixing of rates is a legislative or administrative act, not a judicial one. Under the constitution the court can not place itself in the shoes of the commission and try *de novo* the question what are reasonable rates; and on appeal under said statutes the court can review the acts of the commission only so far as to determine whether the rates fixed by it are unreasonable and confiscatory, and to what extent, in much the same manner as an appellate court determine whether or not the verdict of a jury is excessive and to what extent.

"5. On appeal from the commission the court should take judicial notice of all those general matters of which the commission should have knowledge and on which it would act without proof thereof made on formal hearing."

The case never was heard again in the district court.

Q. (By Mr. FARQUHAR.) It was sent back to the district court by the supreme court of the State?—A. Yes; it was sent back to the district court for a retrial, but never came up again, for the reason, perhaps, that the Great Northern Rail-

way Company had completed a short line from the Red River Valley and from the wheat country to Duluth, which decreased the distance; and thereupon that company established rates which in some instances, for the longer distances, were lower than the rates that had been ordered by the commission. While the commission, for instance, from Crookston, a distance of 300 miles from Minneapolis, had ordered a rate of 14½ cents, the company put in a rate of 14 cents. Another thing the railway company did in this matter which the commission perhaps could not have ordered was to make the same rates for a stretch of 100 miles from each station; and furthermore it made the same rate to Minneapolis as to Duluth, giving the farmers and producers the advantage of those competing markets at the same freight rate and also doing away with the little rivalry that always exists between adjacent stations for the produce of the farmer where the rate is different. The adoption of this rate by the Great Northern of course compelled the Northern Pacific, which operates in the same territory, to adopt the same rates; and right across the Red River is North Dakota, also a wheat State, and of course they had a corresponding benefit from the reduction. The railroads could not very well give Minnesota a much lower rate for about the same distance than they gave to Dakota. In 1897 the law was again amended so as to permit the railroad commission to proceed to the investigation of rates upon its own motion. Up to that time the law required that a complaint must be made by some one. Under that law the commission in 1898 proceeded to investigate the reasonableness of the rate on hard coal from Duluth to New Ulm over two lines of railway, the St. Paul and Duluth and the Minneapolis and St. Louis. I should say here that our law provides for the fixing of joint rates by the commission, but that feature of the law had never been decided until this case came up. The commission fixed the rate for the two roads, and thereupon also divided that rate as between the two roads. The roads refused to divide the rate themselves, and under the law the commission made the division of the rate as well as the through rate. One of the railway companies, the Minneapolis and St. Louis, appealed to the district court. This case was not tried, however, upon the same lines as the Stearnson rate case. The question of the cost of reproduction did not enter into it. It was tried more on the technical points of law as to the power of the commission to make joint rates. Both the district court and the State supreme court sustained the order of the commission. The case is now pending before the United States Supreme Court. It is a case of very great importance on the question of State regulation, involving as it does the right of the commission to make joint rates; and it becomes so much more important in view of the fact that we have another provision of the law which authorizes the commission to compel two roads crossing each other at grade to put in a Y connection between the two roads for the transfer of traffic from one road to another. This case has gone through all the stages of the courts, and it was decided in the United States Supreme Court, in the case of Jacob F. Jacobson v. The Minneapolis and St. Louis Railroad Company, sustaining the law—sustaining the order of the commission. So that if we get a decision sustaining the right of the commission to make reasonable joint rates for two or more companies as well, the two in connection will be very important factors in the regulation of railroads by States.

Q. (By Mr. LITCHMAN.) Will you briefly state the object of this Y—so the traffic can be transferred from one road to the other?—A. Yes. The commission can not order these Y connections in unless it is shown that a commercial necessity exists in the particular case. The necessity was shown in this case. One of the roads, the Great Northern, passes through a heavy timber belt where the cutting of fuel, wood, posts, etc., is quite an industry. The point of connection was out on the prairie, probably a hundred miles from the woods, and crossing a road that was a prairie road practically leading out to South Dakota, and it was for the benefit of the wood choppers and shippers, as well as the wood consumers, that the commission was justified in making the order. The commission can not make an order just because the roads cross each other. If there is no commercial necessity, the courts would not sustain it, even if there should be such an order.

Q. That applies only where the roads cross at grade?—A. Yes; they must cross at grade.

Q. If it was an overhead crossing, it would not apply?—A. Oh, no.

Q. (By Mr. PHILLIPS.) Have you any other laws in regard to grade crossings?—A. No; we have not paid much attention to the protection of life and limb with reference to railroad crossings. We have, of course, a law or rule that where two railroads cross each other at grade they must come to a full stop, unless interlocking signals are provided and approved by the railroad commission. They are getting to be very numerous in our State now.

Q. (By Mr. LITCHMAN.) A road could evade that order of the commission by elevating the tracks and going over?—A. Yes; they could do that. I do not know whether you desire a few statistics with reference to rate reductions that have taken place in our State.

Q. (By Mr. PHILLIPS.) Certainly; it is very important.—A. I have a few here relating only to grain.

Q. We would be glad to have them.—A. I can take only four points. From Alexandria to Minneapolis, distance 133 miles, the rate on grain in 1880 was 21 cents per 100 pounds; in 1885 it was 19 cents; in 1887, 12 cents, and it remains at that rate now. From Fergus Falls it is 178 miles; in 1880 the rate was 23 cents; it is now 13 cents. From Crookston, 300 miles, the rate in 1880 was 27 cents; in 1887 it was 19 cents, and it is now 14 cents. From St. Vincent, distance 890 miles, the rate in 1880 was 35 cents per 100; in 1887, 21 cents, and now it is 16 cents.

These reductions, according to my best information and belief, have been brought about partly by virtue of the operation of the railroad law, but chiefly by increase in the volume of business of the roads, and the improvements and economies that have been introduced of late years in railroad transportation, increasing the size of cars from 400 bushels capacity to 1,000 bushels capacity, and in the increased weight of the engines. The Great Northern Railway, I am informed, can haul about 80 loaded cars in a train—80,000 bushels. This is all I have to say, that I can recall now, with reference to the railroad part of our duties.

Q. (By Mr. LITCHMAN.) This reduction of rates has been the natural reduction from competition, or has it been brought about through the rulings of your commission?—A. I think that the rulings of the commission and the moral effect of those rulings have had a good deal to do with it, but I think it is the introduction of economical methods in operation that has had more to do with it. I do not believe that competition has had—

Q. (Interrupting.) Anything at all?—A. Very little—very little to do with it. Q. It is largely due to improved methods of transportation?—A. Yes; and, of course, in connection with the very important factor of increase in the volume of business which makes it possible.

Q. (By Mr. PHILLIPS.) Was there not an attempt made several years ago to consolidate the Great Northern and the Northern Pacific?—A. Yes.

Q. What have you to say in regard to it?—A. Our State has had a law upon its statute books since 1871 prohibiting the consolidation of parallel or competing railroads. It is not a law that is particularly within the power of the commission to enforce, but rather within that of the governor or of the attorney-general to enforce. Now, at the time of the reorganization of the Northern Pacific Railway, in 1896, I think, there was a scheme on foot by the Great Northern road to obtain control of it—not by personal ownership or community of interest, but the Great Northern Railway Company was to underwrite the securities of the Northern Pacific Railway Company and receive in consideration therefor a majority of the stock, and thus control it and practically consolidate it. Of course the existence of this law was known to the Great Northern Company, and in order to get a ruling upon it a suit was instituted in the Federal court before Judge Sanborn by one of the stockholders of the Great Northern whose name, I believe, was Pearsall, and the case is entitled Pearsall v. The Great Northern Railway Company. The judgment of Judge Sanborn was that the Great Northern Company might underwrite those securities. The case was appealed to the United States Supreme Court. In the meantime the attorney-general of the State of Minnesota instituted proceedings in the district court to test this law, and the district court sustained the position of the attorney-general; the State supreme court likewise sustained his position, and while the Pearsall case was pending before the United States Supreme Court the attorney-general filed a brief in that case as an intervenor, and the United States Supreme Court sustained the law, so that consolidation did not take place, and competing roads in our State can not be consolidated.

Only last summer the Northern Pacific Railroad Company absorbed or consolidated with the St. Paul and Duluth Railroad Company. The St. Paul and Duluth is a short line between the twin cities, St. Paul and Minneapolis, and Duluth; it is about 150 miles. The Northern Pacific also has a line connecting the two cities, but by a roundabout way. The distance on the Northern Pacific proper, between St. Paul and Duluth, is about 250 miles, or 100 miles longer than the other line. In the meantime the Northern Pacific bought the St. Paul and Duluth. Our commission instituted proceedings to test the law again or to prevent that consolidation; but while the case was pending in the district court, the Northern Pacific Railroad Company, through its president and its general counsel, applied to the commission and entered into an agreement whereby they bound themselves for all time

to come to have the St. Paul and Duluth part of the road considered as a separate entity in any case that might arise between the State and the company. For instance, if we should proceed in a rate case against the former St. Paul and Duluth road, it would not be necessary to go into the cost of reproducing the whole Northern Pacific Railroad in the State of Minnesota, but only that portion of it formerly called the St. Paul and Duluth. Of course the case was dismissed without prejudice, and may be reopened at any time.

Q. (By Mr. LITCHMAN.) You spoke of reproducing for the sake of ascertaining the cost?—A. Certainly.

Q. Could you give any estimate of what the cost would be to reproduce that road?—A. Our district court found in one case that the cost of reproducing the Great Northern road—some 1,385 miles in Minnesota—would be an average of \$32,000 per mile. Out of this \$32,000 per mile, about one-third was the cost of the terminals, which the supreme court found to be exorbitant.

Q. (By Mr. PHILLIPS.) Would this law prevent the consolidation of the Northern Pacific and the Great Northern that is rumored to be on hand at the present time?—A. Yes, as far as the road in the State is concerned. That is just what the Pearsall decision meant.

Q. (By Mr. LITCHMAN.) Would it prevent the management buying and managing the interests through the ownership of a majority of the stock by the same parties?—A. I think not.

Q. That is practical consolidation, is it not?—A. I presume to all intents and purposes it is.

Q. (By Mr. PHILLIPS.) If it was joint ownership you could not prevent it?—A. I presume we could not prevent any citizen owning stock in competing railroads or anything else.

Q. (By Mr. LITCHMAN.) Is that not what is being attempted now?—A. I think that is the scheme.

Q. (By Mr. PHILLIPS.) You think that would effectually defeat the law?—A. Not completely so; they would maintain the 2 roads as separate organizations. Of course the community of interest in ownership would prevent, in the future, rate wars as in the past, and I think that is a good thing.

Q. (By Mr. LITCHMAN.) Now, elaborate that just a little.—A. About rate wars? Of course our State commission has had very little experience. We have been very free from those things as far as the State traffic is concerned, but we have noticed it on interstate business. My own observation is that rate wars help only those who are large shippers and who do not need the help of the roads in any way. The small shipper is generally not prepared and has not much to ship at the time so as to take advantage of it.

Q. (By Mr. PHILLIPS.) Has your commission any power to pass on a new issue of stock?—A. Yes. In 1887 an act was passed requiring that all stock issued by new railroad companies should be fully paid; that no increase of stock should be permitted without the consent of the railroad and warehouse commission. Since that time we have, as I recall now, passed upon 3 applications for permission to increase the capital stock, in all of which cases permission was granted.

Q. To the extent asked?—A. To the extent that was asked. A full hearing and complete showing of the necessity of such increase was, however, made before the commission. In fact, this report of 1897, which I shall leave with you, contains one of the findings in such a case.

We have also the long and short haul clause. Under that, as I recall it, we have had 2 applications for the suspension of it. The commission has the same authority to suspend the operation of the long and short haul clause as has the Interstate Commerce Commission. In these 2 cases the application was denied.

Q. If your commission should refuse to allow an increase of stock, what action could the railroads take, or could they take any?—A. I do not know as they could take any, except there would be a roundabout way, I presume, by incorporating some other company and changing it that way.

Q. (By Mr. FARQUHAR.) Is this regulation of stock under Minnesota charters?—A. It applies only to railroads incorporated in the State of Minnesota, and it does not apply to the Great Northern Company, which has been a chartered road from 1856, and it does not apply to the Northern Pacific; it only applies to a few of the roads that are incorporated under the general incorporation law.

Q. (By Mr. LITCHMAN.) Would your laws permit the operation in your State of a road chartered under the laws of another State?—A. Yes.

Q. If its location was entirely in your State?—A. I do not know about that. I am not a lawyer.

Q. (By Mr. PHILLIPS.) In what manner are the railroads taxed in your State? Has your commission anything to say in this regard?—A. In our State the rail-

roads pay a percentage upon the gross earnings in lieu of all other taxes. A new road pays 1 per cent on its gross earnings for the first 3 years; for the next 7 years it pays 2 per cent; after 10 years it pays 3 per cent on its gross earnings. The gross earnings, for purposes of taxation, are, in the first place, all earnings on local business, business within the State, and, secondly, a mileage proportion of earnings on interstate business. We have found no better way of ascertaining our proportion of interstate earnings than to divide it by the road mileage. It is probably not absolutely correct.

Q. Is there any special complaint from the railroads in regard to this taxation?—A. No.

Q. It is satisfactory?—A. It is satisfactory and promptly paid, costing the State very little. Our commission gets up the blanks upon which the companies make their returns. These are sent to the commission, and by the commission they are checked up and approved and sent to the State auditor and treasurer for collection.

Q. (By Mr. LITCHMAN.) Are you in a position to give us a tabulated statement of the amount realized from that tax covering a period of, say, 10 years?—A. I am not in a position now; I can get it.

Q. When your testimony is submitted to you for revision, will you supply such tabulation?—A. I will.

STATE OF MINNESOTA,
OFFICE OF THE RAILROAD AND WAREHOUSE COMMISSION,
St. Paul, May 4, 1901.

Statement showing amount of taxes paid by the railroads in Minnesota for 10 years, and miles of main line of railroad in Minnesota each year.

Year.	Taxes paid	Miles of main line.
1890.....	\$743,075.87	5,409
1891.....	882,472.96	5,527
1892.....	1,036,262.01	5,615
1893.....	923,864.43	5,863
1894.....	850,109.48	5,912
1895.....	1,009,224.40	5,990
1896.....	1,037,194.40	5,991
1897.....	1,127,950.24	6,086
1898.....	1,261,352.47	6,062
1899.....	1,444,503.82	6,388

A. K. TEISBERG, *Secretary.*

Q. (By Mr. FARQUHAR.) The commission would like to have a set of blanks.—A. Yes.

I will say that in 1896 the taxes in the State amounted to \$1,037,000; in 1895, to \$1,009,000; in 1899 they amounted to \$1,444,000—about; constantly increasing.

Q. (By Mr. LITCHMAN.) That tax is collected directly by the State?—A. Yes.

Q. Is there in addition any local taxation?—A. No local taxation. This percentage is in lieu of all other taxes.

Q. In your experience as a member of your commission have you found that, within reasonable bounds, the rate fixed is not of so much importance as that the rate shall be uniform to all patrons of the road?—A. Yes; that is the main point, in our opinion. I think perhaps in the State we are not very much troubled by secret rebates or discriminations of that kind. I think there is no special reason why one road or another road in our State should give any of its shippers any rebates for State business.

Q. Could not the same result be reached by special privileges?—A. Certainly it could; but I mean I can not see why under the circumstances a railroad should be tempted to do it; it gets the business anyway. On business between Chicago and the twin cities there is a great deal of competition, and I imagine that rebates and various other schemes are very often resorted to.

Q. It was testified here yesterday or the day before that sometimes the regulation of the road requires cars to be released in 15 days, but that sometimes the dates get confused and the 15 days lengthened out considerably with some shippers.—A. Yes. Speaking of the release of cars reminds me that, when we have a large crop of wheat, in the fall of the year my principal work is to run down to the railroad, or call them up by phone, and say: Can you furnish Mr. So and So cars at such and such a station? The grain is marketed, unfortunately, I think, in

the course of about 3 months, and when the crop is large, of course, it overtaxes the capacity of the railroads, and not only that, but it frequently overtaxes the capacity of the terminal elevators to receive and unload it promptly.

Q. (By Mr. PHILLIPS.) Have you any other mode of taxation except the one you allude to?—A. No. The gross-earnings tax is in lieu of all other taxes. They pay no local taxes and no assessments. Our legislature of late years, that is, in the last two sessions, has touched upon the propriety of raising the tax. I think there will be a proposition this session to raise the tax to 4 or 4½ per cent; the railroads will, of course, fight it.

Q. (By Mr. CONGER.) The highest rate is now 3 per cent?—A. Yes.

Q. Does your State make any difference between roads as to their earning capacity per mile?—A. The 3 per cent is regardless of the earnings per mile.

Q. The same on a poor road as on a better or more productive one?—A. I say 3 per cent on all roads; but I must correct that statement. The Chicago Great Western unearthed an old, forgotten charter—from 1854, I think. This charter provides for a gross earnings tax of only 2 per cent, and the State is bound by it.

Q. (By Mr. A. L. HARRIS.) Do the entire receipts from the roads on taxes you describe go into the general-revenue fund of the State?—A. Yes.

Q. And no part of it is distributed to the counties?—A. No; there has been some agitation in the legislature to do that, but so far it has not passed.

Q. (By Mr. PHILLIPS.) What effect had the voluntary reduction of the freight rate by Mr. Hill some years ago on the price of farm products, or does the reduction increase or decrease that price?—A. As long as that reduction in rate on wheat from the point of production to the market was confined to a certain small area, the amount of that reduction went to the producer; but last spring the commission succeeded, after considerable negotiation with the railroad companies doing business in the southwestern part of Minnesota, in having them adopt the same rates for the same distance as the Great Northern road had adopted in 1897 in the northern part of the State; and that again reduced, I presume, the rates from South Dakota correspondingly to Chicago—and from Iowa. So that now, I presume, the reduction in the grain rate no longer helps the producer, but rather the consumer. As long as you can confine a reduction on a commodity like grain to a certain small locality, then the producer gets the whole benefit of it; but the moment it spreads throughout the whole country the consumer gets the benefit.

Q. Now, what is your power as a commission over the regulation of elevators?—

A. The legislature in 1885 passed an act covering the terminal points of St. Paul, Minneapolis, and Duluth. This act was based largely upon the Illinois law with reference to public elevators at Chicago. I think we improved on that act by adding to it the weighing department, so that the State, through its employees, now not only inspects and puts a grade on the grain marketed at these terminal points, but it also weighs it out of the car into the elevator, or out of the elevator into the car or into the vessel. This law was intended to cover all elevators located at these terminal points, but it was soon found that at Minneapolis, more particularly, it was not as profitable to do business as a public licensed elevator. They were required to take out a license from the commission and furnish a bond; so they have evaded the law by not (as they claim) mixing the grain of different owners. In a public house of course the grain of different owners of the same grade may be mixed; in the private elevators at these terminal points that can not be done. So they themselves buy the grain of certain parties on the outside, or grain dealers have certain bins in certain elevators, and the grain is put into the private elevators. There is no prohibition of mixing in public elevators, but the grain of different grades must not be mixed. In Minneapolis there are something like 30 elevators, and out of this number there are only 6 licensed public elevators. At Duluth and Superior all of the large elevators are public licensed elevators, doing business under the laws of Minnesota. The grain comes into Duluth and is graded and put into bins with reference to its grade. The grain comes into Minneapolis and is also inspected and graded, and the commission merchants and grain dealers take their samples and bring it on 'change; the greater bulk of it is sold from sample. I believe the operation of the system in Minneapolis, the sample market, is in the interest rather of the producer. It is not altogether to the interest of the elevator man. He has, of course, some advantage in mixing, but I think it also gives an advantage to the farmer who has off-grade grain that could not go into a public elevator—gives him a chance to dispose of it. A farmer who perhaps raises gilt-edged grain gets a premium above the regular grade price for his best wheat, where if he sent it to Duluth he would simply get the grade price and no more. But when it comes to shipping out, Duluth grades are held in the world's markets much higher than the Minneapolis grades. In fact, I do not believe the Eastern buyers as a rule

will take Minneapolis grade, for the reason that they are mixed to the lowest possible point.

Q. (By Mr. LITCHMAN.) Is it pertinent here to ask who grades the grain in the public elevators?—A. The inspectors are appointed by the railroad and warehouse commission. The State railroad and warehouse commission in the first place appoints a chief grain inspector who has charge of all the inspection. He appoints a chief deputy at each of these terminal points and as many deputy inspectors as necessities require. This system, as I stated, was inaugurated in 1885. The commission, in 1889 appointed Mr. A. C. Clausen as chief grain inspector, and he had charge of that department as chief grain inspector until by an unfortunate turn in the political wheel the opposition party got into power and turned him out in 1899. During Mr. Clausen's administration, the department had practically been run on civil-service rules. When a new man was appointed in the inspection department he started in as a helper; he carried the brass rod and took the samples from the various parts of the car and brought them to the inspector, and kept at that for years, perhaps, until he had shown his ability to assume a higher position, when he was made subdeputy inspector; from that again he rose to the position of deputy inspector. During Mr. Clausen's administration—who was an expert grain man before he took charge of this business—the certificates issued by the inspection department on grain going out from Duluth by vessel to Buffalo or New York, were sold upon such certificate, and the grain trade at those points accepted the certificate without bothering about seeing the grain at all. Of course that was disturbed, at least for a time, by the change of administration in putting in new and inexperienced men from top to bottom almost. Many of the former inspectors were replaced by new men, some of whom had had experience, but at the same time the trade did not know whether they could rely as much on their judgment as on that of the former inspectors.

Q. Is this form of inspection applied at private as well as public elevators?—A. Yes; we inspect grain out of private as well as public elevators. We do exactly the same business for both, except that for public elevators we register the warehouse receipts.

Q. You grade the grain for the private elevators?—A. Yes. When the grain goes out of the private elevator, the rule is that it must be fully up to the average sample of the grain out of a public elevator. You see, in a public elevator at Duluth or Superior the best quality of the grade and the lowest quality of the grade goes into the same bin, which makes a good average, putting the best and the poorest and the middle in together; while at Minneapolis the best is probably bought by the local millers to mix with inferior. The same is true about the private elevator. Once in a while he will have to buy a good grade to build up his poor wheat so as to pass the grade. At the same time, No. 1 northern, of Minneapolis, is not considered as good as No. 1 northern from Duluth. Our registry system is very similar to that of Chicago, except we have always been very careful not to permit any outshipments of grain from the public elevator without the cancellation of the receipt.

Q. (By Mr. A. L. HARRIS.) In case the owner of the wheat is dissatisfied in regard to the grain, is there any recourse?—A. Yes.

Q. Please describe how that is taken.—A. In the first place, the inspector grades the wheat, and the sample is generally kept for the office. Then the commission man's representative will follow him right up and look at the car and take a sample; and if, in his judgment, the grain has not been graded high enough, he takes an appeal to the chief deputy inspector. He also brings a sample of the wheat, and the chief deputy inspector passes on the samples taken by both parties in interest and either sustains or changes the grade. If either party is dissatisfied with the determination of the chief deputy inspector, there is an appeal to the board of appeals. That body was created 2 years ago. It consists of 8 men, practical grain men, at Minneapolis, and 3 others at Duluth; and they have the final determination of the grade on any particular carload or quantity of grain brought before them. There is no appeal from the decision of the board of appeals. Prior to the establishment of the board of appeals the final appeal was to the railroad and warehouse commission. The railroad and warehouse commission was not, as a rule, composed of grain men or grain inspectors, and so we had to rely entirely on the judgment of the chief grain inspector or the local chief deputy, or such other grain men as we might get hold of at the time. I think the establishment of the board of appeals is in line with the action of the Illinois law. They also have a board of appeals there, I believe.

Q. Is the manager of a public warehouse allowed to buy grain?—A. Yes; there is no prohibition on that.

Q. As well as the private elevator?—A. Yes; there are no restrictions as to that.

Q. Has there been any complaint that he had an advantage over the outside buyer on account of his ability to know the quality of the grain that he has under his charge?—A. No; I do not think so. I have heard no complaints in that regard whatever.

Q. (By Mr. LITCHMAN.) This grader is in the employ of the State?—A. Yes; appointed by the railroad and warehouse commission. Now, in order to pay the expense of this service we levy a fee for inspection, which at the present time is 25 cents per carload, and another 25 cents per carload for weighing, and that creates sufficient revenue to pay the employees of the department. For inspecting and weighing out to vessels we charge 50 cents per 1,000 bushels.

Q. (By Mr. A. L. HARRIS.) What switching arrangements have you between the roads? Is that under the control of your commission?—A. Yes.

Q. Do you regulate the fee for switching?—A. The commission has never attempted to regulate it since 1888. The rate is not unreasonable and varies, of course, with the distance, from \$1.50 or \$2 a car perhaps up to \$5 for long distances. If a carload of grain is unloaded into an elevator upon the tracks of the company bringing it in, there is no charge for switching; but if it is hauled to a mill or an elevator on another road, there is a switching charge, which, of course, the shipper has to pay.

Q. Have you any control over the amounts fixed by the roads for demurrage?—A. Yes; we are supposed to have, but we have never exercised it, except by having conferences and discussing the matter with them and reducing it to a reasonable figure—I think \$2 after the first 24 hours. Of course, as a matter of fact, demurrage is not ordinarily charged except during the busy grain season when all the cars of the company are in service and demanded, and I think that perhaps the demurrage charge is too low.

Q. (By Mr. LITCHMAN.) It is \$2 per car?—A. Yes.

Q. Can you explain a little more fully the mixing of grain at terminal points to raise the grade? It is sometimes done, is it not?—A. Yes; I think it is. In the first place, this can only be done legally when the grain belongs to one owner. You can not mix grain of different grades belonging to different owners. They will buy a No. 2 wheat—a good No. 2—and then they will buy a good No. 1, or perhaps two cars of good No. 1 to one car of fair No. 2, and mix them together and possibly succeed in making the mixture No. 1. However, a great deal of this mixing is done for and on behalf of and under the instructions of millers for local consumption. The millers require, in order to show the best results, a certain proper mixture, which is a secret with them perhaps, and they instruct their men what to mix and how to mix it; and some of these private elevators are engaged entirely in mixing grain for the local millers. We frequently have trouble, of course, when grain goes from Minneapolis out of these mixing houses to Duluth, which happens very often in the spring of the year. At Duluth, as I stated before, under that system the average is perhaps a little higher on the same grade than the Minneapolis mixture makes it. So that when a carload of grain which in Minneapolis has been graded out as No. 1 gets to Duluth, it is very often called No. 2, or refused by the public elevator.

Q. In this mixing of grain is there any injustice done to the farmer?—A. I think not. I can not see where it is. As I stated before, the farmer who raises gilt-edged wheat will get a premium for his wheat, while the farmer who raises wet wheat or smutty wheat or wheat that is not warehousable can dispose of it at the sample market and get what it is worth. Furthermore, if in the judgment of the buyer the inspection department should make a mistake, the buyer can pay the price of No. 1, even if it is graded No. 2.

Q. Your special inspectors are not in any way under the employ or patronage of the elevator people?—A. No; they are strictly prohibited from receiving any compensation or anything in the shape of benefit.

Q. (By Mr. PHILLIPS.) There is a penalty?—A. Yes. They are under bond of \$5,000.

Q. (By Mr. LITCHMAN.) There is no condition of affairs under which the judgment of the elevator man in any way comes in to fix the grading?—A. No. There is a penalty provided for anyone who is convicted of attempting to influence the inspector, and I do not know of any case where it has been attempted.

Q. What is the salary of your inspector?—A. The salary of the chief grain inspector is \$3,000 per year, and the deputy inspector's salary is \$115 per month.

Q. Every month in the year?—A. Every month in the year. We can not get suitable men for the busy season and drop them in the dull season. We keep them the whole year.

Q. (By Mr. PHILLIPS.) How many are employed in the State?—A. We have one chief and three chief deputies. I have not the figures here. We have in the grain inspection and weighing department an average of 150 to 160 men.

Q. (By Mr. LITCHMAN.) What is the lowest paid employee?—A. The lowest paid salary is that of helper—\$62.50.

Q. That is also for 12 months?—A. That not being skilled labor, we frequently have to put on some extra men in the busy season and drop them off at the end of it, but a certain number are employed the whole year.

Q. Is there such a thing in that locality as an elevator combine?—A. You mean for fixing the price?

Q. Yes.—A. Well, I do not know.

Q. It probably does not come within your official knowledge, but speaking generally as to your information and belief.—A. I do not know. Probably the same influences are at work there as at Chicago and other grain markets.

Q. Have you any knowledge as to a consultation to fix the price of grain?—A. No; I have not.

Q. (By Mr. PHILLIPS.) If any outside buyer should go there and pay a better price at one elevator than was the usual custom along the line of that road, would he have the same facilities for shipping his grain?—A. Yes. I was going to say something on the country part of the question. I was going to make this general statement: That prior to the establishment of the Railroad and Warehouse Commission, in 1885 or 1887, the country elevator business was done almost exclusively by what we call line elevators; that is, a company having an office at Minneapolis or Duluth and a line of elevators on one or two roads out in the country. The farmer could not get a car to ship his own grain to the terminals. The railway companies threw all the obstacles possible in the way. In fact, it hardly ever happened that an independent buyer or a farmer could ship his own grain. But laws have been enacted in our State which have declared it a discrimination where the railroad company has room and refuses room to any party to build an independent elevator at its station.

Q. When were these laws passed?—A. That law was passed in 1887. In the first place, we passed a law in 1885 which declared that every applicant should have a site on the right of way on the payment of an annual rental of \$1. That was set aside by our supreme court on the ground that it did not provide for due compensation. So in 1887 the general railroad law gave the commission authority to proceed in the matter; and in 1893 the more specific act was passed which provides for condemning sites for elevators on the railroad right of way—proceeding in the same manner to condemn the sites as the railroad does to condemn for its right of way. That law has been declared constitutional by our State supreme court, and has not been appealed from.

Q. (By Mr. A. L. HARRIS.) It gave the elevators the right of eminent domain to that extent?—A. Yes. In the second place, the legislature of 1893 passed a law requiring railroads to build spur tracks or side tracks to elevators of a certain capacity, or mills located adjacent to the right of way if the railroad company did not have the room or had refused applicant room for an elevator at its way station. He could then build his elevator adjacent to the right of way and demand of the railroad company the construction of a spur track to it. If they could not agree upon the terms, then they are at liberty to appeal to the commission to fix the terms.

As a general thing, agreements have been reached when the applicant has shown his determination to get an elevator at a certain station. They generally find room on the side track for him. Quite recently, however, the commission had to pass upon the cost of a spur of track to a mill. When the commission fixed the amount that the applicant should pay for grading and constructing the road, the railroad company acquiesced in the decision. The former policy of the railroads of permitting only line elevators upon their road has been wholly reversed. There is hardly a station in Minnesota now but what has a farmers' cooperative elevator or some independent elevator of that character. Our law prohibits the pooling of the business of country elevators. Of course, as a matter of fact, I presume they generally pay the same prices, and the best man gets the grain. They can only compete as to grades, the prices being the same. One can grade a little more liberally than another, but the amount of business done at the local station where there is such competition depends very largely upon the man in charge of the elevator, how he stands in the community, and how his reputation is for honesty and fair dealing.

Q. (By Mr. LITCHMAN.) It depends considerably also upon the quality of grain he has to sell?—A. Yes.

Q. If he has a high grade of grain, he in his turn is independent? Is that a fact?—A. Yes. Then, again, the producer has this right, which has also been the

case quite extensively: He can demand a car on the side track of the loading track from the railroad company and have 24 hours in which to load it, without demurrage, and that makes the producer independent of the local elevator combine, if there is such a thing. If he feels that he can not get fair treatment from the local elevator, he can ship his grain and save handling charges. Handling charges at a country elevator are usually about two cents a bushel.

Q. (By Mr. PHILLIPS.) Would they charge such a shipper more than the others for a single car in shipping it?—A. The elevators?

Q. No; I mean the farmer. If he would load a single car in this 24 hours would he get the same freight rate to Chicago?—A. I presume he could to Chicago. I do not know. But all our grain goes either to St. Paul, Minneapolis, or Duluth.

Q. Would he get the same freight rates there?—A. The same freight rates there, of course. The law provides that one carload shall be shipped at the same rate as any number of carloads.

Q. (By Mr. LITCHMAN.) It is claimed before the commission that, while that theoretically is true, in practical operation the car is not available at the time it is needed.—A. Well, that may be true at certain times, but it is believed that it is not the fault of the railroad company. There are, as I stated before, certain times of the year when it is absolutely impossible for the railroad company to supply the demands. I have seen thousands of bushels of wheat dumped along the side track and at the station by the Red River Valley. That is the breadbasket of the world.

Q. (By Mr. PHILLIPS.) Dumped upon the ground?—A. Yes. The farmers out there have no granaries. They thrash from the shock—steam thrashers—and the teams haul no grain to the station. Now, this year it happened to be an extraordinary large yield. The elevators were all full; the terminals were all almost blocked, so the railroad company was helpless; they did all they could. My best information and belief is that the railroad companies, at least the majority of them, favor the independent shipper that way. They do not like to favor a curbstone dealer, a man who has no business whatever, who just stands on the street and gobbles up the farmer's wheat; but if the producer himself desires to ship his grain I believe the railroad company would stretch a point and give him the car in preference to some elevator man.

Q. (By Mr. LITCHMAN.) Now, about this card price sent out every day to the farmer. It is alleged that this is made up by the combination at Minneapolis. Have you any knowledge in relation to that?—A. As I understand it, at the close of the day—the of the business day—the quotations of the last sales are noted down, and the line elevators send that information out to their agents. If an independent elevator wants that quotation he will have to make his arrangements with the commission man in Minneapolis, St. Paul, or Duluth, and get the same either by wire or mail. I do not think there is any combination other than this: That they are probably backed by some concern, or something of that kind.

Q. Then does not that practically announce the fact that the price to the farmer is fixed at that daily session?—A. Yes.

Q. And the farmer practically is compelled to accept that?—A. Yes. The farmer the next day will probably get the price of the day before.

Q. Then it practically amounts to fixing for the farmer the price at which he must sell his grain?—A. You may call it that. At the same time, no grain buyer, I presume, could afford to pay any higher price than the market warranted.

Q. Well, if by manipulation of the market the price was beared down, it would be to the detriment of the farmer, would it not?—A. Probably.

Q. You have virtually answered the question whether the individual shipper of the grain gets this card price. He can only get it through the commission merchant at Minneapolis, I understood you to say.—A. Yes; I think that is the custom.

Q. Unless it is given to him by the local agent?—A. Yes; the local station agent may give it to him. In that case I presume he would have to make his arrangements with the Western Union.

Q. What percentage of the farmers are forced to sell grain within three or four months of thrashing? I mean forced in the sense that their pecuniary necessity may compel them to sell it.—A. Well, I hardly have information upon which to base an answer to that. The percentage is very much less now than it was some years ago.

Q. Have you any knowledge of any combination between the railroads and elevator companies?—A. No; I have not.

Q. Have you any knowledge of community of interest between them?—A. I have no definite knowledge. I have my suspicions once in a while.

Q. You have knowledge whether the same men are stockholders in both?—A. No; not to any great extent. My knowledge is rather limited.

Q. The community of interest could be brought about in that way?—A. Certainly.

Q. Your judgment is that the farmers' elevators receive the same courtesies from railroad companies as line elevators?—A. As far as my information goes; yes. They pay the same rates and receive the same treatment.

Q. Do you know of any rebates being given to elevator companies by railroad managements?—A. I do not.

Q. It has been alleged that such is the case.—A. I do not know of any case within my official career in the office—15 years. Of course I hear rumors once in a while, but I have never been able to verify them.

Q. Have you any information to express as to the effect of grain gambling upon the price paid to farmers?—A. No, I have not. It is a subject beyond my reach.

Q. (By Mr. PHILLIPS.) What had the Leiter deal in wheat to do—that is, how did it affect the people there, if in any way, and how was it viewed by the farmers, favorably or unfavorably?—A. It was viewed very favorably by the farmer who happened to have any grain to sell at that time. I know of one party who had three years' crops in his granary that sold for \$1.45 per bushel at the local station. Grain at that time should not have been worth over 85 cents.

Q. How would they have viewed it if there had been a bear movement instead of a bull movement?—A. Well, this farmer whom I referred to, who saved three years' crops, saved it on account of the low prices prevailing before; he could afford to do it, and it was a good speculation. Ordinarily I do not think it is a good speculation for a farmer to hold his grain. I have been so informed by farmers who are intelligent and farming on a large scale. They always make a practice of selling it at once.

Q. (By Mr. LITCHMAN.) Even if they buy futures?—A. Sometimes they buy futures.

Q. (By Mr. RIPLEY.) Is that practice very good?—A. It is practiced by certain large farmers only. I do not think it is practiced much by small farmers. Most of our farmers are small farmers.

Q. (By Mr. LITCHMAN.) They turn grain into cash and then buy futures?—A. Yes.

Q. Have you any suggestions to make as to national and State legislation, so far as your experience goes?—A. As far as State legislation is concerned, I think we are pretty well fixed in our State. I think we have good laws covering almost every conceivable point, and we have now obtained the decisions in the highest courts on several points sustaining us, clearing the atmosphere. We know where we are at. As far as national legislation is concerned, it seems to me that the Interstate Commerce Commission ought to be empowered to do about the same thing as the Minnesota commission; that is, upon complaint being made, have the right to regulate or reduce rates in certain instances. I do not believe that the Interstate Commerce Commission should be empowered to make all the rates by any means, but I do think that they ought to be empowered to adjust discriminations after proper hearings—discriminations as between localities and perhaps also as between commodities.

Q. Would you supplement that by the right of appeal to a court of appeals?—A. Undoubtedly there should be an appeal from the commission; otherwise I do not think it just and fair.

Q. (By Mr. PHILLIPS.) Would you be in favor of enlarging the powers of the Interstate Commerce Commission?—A. Only to that extent. I think also that there should be a compulsory system of uniform accounting and a Government supervision of railway accounts.

Q. You would be in favor of increasing the power of the Interstate Commerce Commission in regard to leasing railroads and the issuing of new stock, etc.?—A. Well, that of course is somewhat a new question now growing out of consolidations, and I am hardly prepared to express an opinion on it.

I might state, while I think of it, now that our law prohibits pooling—our State law—on the same terms as the interstate-commerce act. Our commission, in 1889, I think it was, unanimously declared itself opposed to any change of that pooling clause. I think, now, if the question were presented to them, in view of the recent practical consolidations, the commission would be in favor of legalized pooling. Personally I know I should be, but if this community of interest, consolidation in that way, goes on, of course there will soon be no necessity for legalized pooling.

Q. Your State has more power in regard to leasing roads, capitalization, or issue of new stock than the Interstate Commerce Commission, has it not?—A. Oh, yes; I do not think the Interstate Commerce Commission has any power as to leasing of roads or as to capital stock.

Q. You are not prepared to state whether you are willing to grant it an increase

of power—the same power your commission has in your State?—A. I think it is not of great importance in our State any longer now. If the matter of rates is to be settled on the cost of reproducing the railroad, the amount of stock and bonds cuts very little figure.

Q. (By Mr. A. L. HARRIS.) You say your law was framed after the old Illinois law. That is an old statute, is it?—A. The grain law, you mean?

Q. Yes.—A. Yes; framed on the Illinois statute.

Q. That is an old statute or new one?—A. An old one; I should presume it was in existence prior to 1885.

Q. Do you know what change has been made in the Illinois statute?—A. I think they have added a weighing department to their grain department. I am not sure; I have not kept track of it.

Q. Has the law been bettered in that respect?—A. Yes; if that has been added, I think it is an improvement to the law.

Q. Does the local shipper find the same opportunities at the terminal elevator that the general elevator buyer does at local points?—A. Yes, on most of the roads. I think the independent elevator man or the producer, the farmer himself, who wants to ship his grain, receives the same accommodation that the elevator man does. Of course a railroad company can do business more rapidly by doing the grain business through a well-kept elevator. If they should do it all by farmers loading cars, it would delay their cars very materially. But the fact that the farmer has the right and the railroad company is compelled to give him a car and does give him a car and furnishes a loading platform where he drives his team up and dumps the wheat right in—the fact that that right exists and is once in a while exercised makes the local elevator man treat the farmer more justly than he otherwise would.

Q. Are terminal elevators owned by private companies or by the railroads?—A. The terminal elevators, I think, are generally owned by the independent elevator companies. At West Superior, Wis., the Great Northern has its own elevator.

Q. But they are all under the same law?—A. All operating under the same terminal law.

Q. And under your control?—A. Yes. Through an arrangement with the Wisconsin authorities we do exactly the same kind of a grain business in Superior as we do in Duluth, and the elevators there are operating under the same regulations.

Q. (By Mr. PHILLIPS.) Have you anything else to present?—A. No.
(Testimony closed.)

WASHINGTON, D. C., February 5, 1901.

TESTIMONY OF PROF. HENRY C. ADAMS,

Statistician Interstate Commerce Commission.

The commission met at 2.06 p. m., Mr. Farquhar presiding. At that time Prof. Henry C. Adams, statistician of the Interstate Commerce Commission, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your name and address.—A. Henry C. Adams, Ann Arbor, Mich.

Q. What is your position with the Interstate Commerce Commission?—A. I am the statistician of the Interstate Commerce Commission.

Mr. FARQUHAR. Mr. Kennedy, of the subcommission on transportation, will lead the examination.

Mr. KENNEDY. I think Professor Adams has in mind the topics that he desires to discuss, and that it would be best if he be permitted to take his own course and select just such subjects as he thinks will be of value to the commission.

Mr. FARQUHAR. Then you can just make your statement in your own way.

The WITNESS. Mr. Chairman, I thought it might be interesting to the members of the commission to hear something about the method that the tax commission of the State of Michigan has adopted for arriving at the valuation of railway properties. This is an important question, especially in view of the theory that our courts have adopted that a reasonable rate must have either some direct or indirect relation to the valuation of such properties. This method that has been adopted in Michigan is a little peculiar. I know of no instance in the history of this matter where exactly this method has been followed. It is attracting

some attention, and I submit it this afternoon with the thought that some such method as this might possibly be desirable as a step toward arriving at the solution of that vexed question of railroad rates. The situation in Michigan in regard to taxation is a little peculiar. We have there what is known as a system of special corporation taxes, by which railroads and other properties of that class mentioned are subjected to a tax on gross earnings, the rate varying with the classification of the corporation. Now, the people of Michigan felt that the rate which these properties paid under the statute was not equal to the rate of taxation under the general property law, and the prime object of this investigation, which a special tax commission undertook, was to answer the question whether or not there was equal taxation between railways on the one hand and general property on the other.

Q. (By Mr. FARQUHAR.) Does this investigation cover interstate roads as well as State roads?—A. All roads lying within Michigan.

The plan adopted by the commission involved, first, an appraisal of the physical properties of the road, and, second, an appraisal of what was termed the value of the nonphysical elements. I shall first try to explain the rule of arriving at the physical valuation, and afterwards the rule of arriving at the nonphysical valuation of these properties.

Without discussing many rules that might perhaps have been adopted, the theory followed by the commission was to appraise first the physical properties of the road, on the theory of the cost of reproduction; to estimate carefully all of the elements that go into a railroad property; to proceed with the matter just as an engineer would proceed if he was to make an estimate for building a road, and how detailed that was I will try to show in a moment. Having gotten the physical value as to the cost of reproduction, it was then said by the commission that that cost should be reduced somewhat on an accepted percentage on account of deterioration. Some of the items, of course, could not deteriorate, and hence the present value of the road would be the same as the cost of reproduction. Other items, such as ties, such as rolling stock, would necessarily deteriorate, and there was a reduction in the valuation. So this report on physical valuation is under two columns. One is the cost of reproduction and the other is the present value, estimated or gotten at from the basis of the cost of reproduction.

Now, the commission adopted the classification of construction expenses prescribed by the Interstate Commerce Commission as the basis of its analysis. There are 31 general items in that classification. Each item or heading of this official classification has been worked out with great detail. The commission adopted this because it was the official classification, and it is the classification that the Interstate Commerce Commission insists upon when the roads report an increase of their road or analyse their current permanent improvements.

As I said, the commission's estimates of these properties, based on the official classification, are set forth in two columns. The first column gives the cost for each item of reproduction, and the second column gives the present value, so that, independent of stores and supplies, it shows the final footings. In the second column is the value of the physical properties as the property stands on the day of appraisal.

Now, the reliability of such an appraisal, of course, depends upon the accuracy of the theory of the cost of reproduction. I think that the theory of reproduction is correct, with one exception. That is possibly the matter of real estate, which I shall refer to in a moment. It relies, in the second place, upon the care with which the work is done, and in the case of Michigan the work was done independently of the roads. The political conditions were such that they permitted the payment of good compensation; and the services of men who themselves had built a considerable amount of road, and who had been engineers upon the road, were secured, and a specialist, you may say, was secured for every particle or portion of this work. Now, in the case of the grading, for example, the profiles of all the roads were secured, and I contend that the major portion of these roads were traveled over by agents of this commission, so that from personal observation they could tell about what the cost of the grading and embanking and all that would be.

In the case of rolling stock also another set of men were put upon the road, and the numbers of freight cars of certain classes were, of course, furnished by the road or by the railroad commissioner, and then a sufficient number of the cars in each class was personally investigated, and so they were able to set down a correct price for cars. So it was in the cost of interlockings, in the cost of ballast, in the cost of warehouses, in the cost of docks—it was a personal investigation by representatives of the tax commissioners. In the case of real estate estimates the commission did not rely entirely upon the appraisal of the local assess-

sors; indeed, they rather relied upon the services of expert real estate agents of the localities, and they went so far in important cases as to trace the deeds of abutting property to find out what the selling price was of abutting properties, of right of way, or of the term. So in that instance, so far as the valuation of the physical properties is concerned, it seems by this method that Michigan has gotten out a fairly correct and adequate valuation.

Q. (By Mr. KENNEDY). Have you had the judgment of any of the railroads as to the accuracy of this work?—A. Yes; we have had the judgment of the railroads as to the accuracy in some instances, but more especially as to the accuracy of the methods. I might say this work was only finished last week, and we have not had, therefore, test of the railroad opinion—the benefit of the railroad expert opinion upon it; but the manager of one of these roads stated that the State was in possession of a better analysis of its property than he possessed himself. At first, as was naturally the case, the railroads were not interested in this investigation; but, recognizing that it was carried on without any political interest, and that it probably would be carried on in an honest, open, and candid and scientific manner, they finally, I think in general, gave their—they at least gave the agents of the commission the privilege of appearing upon their property, and in the case of architects, for example, I remember that one of the important roads loaned the services of its architect on condition that he did not work upon the property of his own road.

There is one point of considerable importance: Is it possible to apply the theory of the cost of reproduction to real estate? I may perhaps interject here that this work was done under the direction of the head of the department of mechanical engineering of the University of Michigan. The other portion of the work was done under my own direction, which I will speak of in a moment. There was one point of difference of opinion between Mr. Cooley, who had charge of this work, and myself, namely, in regard to the propriety of applying the principle of the cost of reproduction to real estate. It seemed to me that in strict theory, at least, it was not proper to apply the principle of the cost of reproduction except to properties that can be reproduced, and reproduced in unlimited quantities, and of uniform cost. The true value of real estate, after all, is the opportunity that it gives for the location of an industry, and it is quite possible and conceivable that that value can not be properly arrived at on the theory of the cost of reproduction. But beyond that I should approve most heartily the work that has been done, and the theory of the cost of reproduction in arriving at the physical valuation.

Now, the above computation extends no further, you notice, than the value of the physical properties. It is well known that a successful corporation has a valuation frequently in excess of its physical properties, and what seemed to the commission, at least, to be the more difficult problem was to arrive at the value of the nonphysical properties of these corporations.

Q. Before you leave this table may I ask why these columns of terminals and electric plants are blank? (Referring to sample estimate.)—A. The terminal is blank because wherever there is a considerable terminal there is an extra sheet. For example, the Port Huron terminal proved to be so significant a feature that it was taken out of the main sheet, and there is a separate statement where it is a matter of importance. In the case of the Michigan Central, for example, the terminal value of about 5 miles in Detroit was between 7 and 8 millions of dollars, and that was one-third of the value of the road itself. That is the explanation of that fact. In the case of the absence of electric light, probably in that road there was no electric-light plant. Many of the roads are rather small.

Now, it was at this point, after the commission had decided to make a valuation of the physical properties, that the problem was submitted to me to give a rule for valuing what is commonly called the franchise of these corporations, and I provided here a copy, so you could follow, if you care to, the rule and the argument for the rule which was submitted and which was in the main approved by the commission.

I will read to you this letter, and make a few comments upon it as to what seems to me of importance [reading:]

METHOD OR RULE FOR COMPUTING FRANCHISE VALUE.

ANN ARBOR, MICH., October 4, 1900.

To the Board of State Tax Commissioners, Lansing, Mich.

GENTLEMEN: In reply to your request for a method of valuing the nonphysical element in railway properties, I submit the following:

First, it is understood that the object of the investigation instituted by the Michigan tax commissioners is to determine whether the properties imposed with specific taxes pay, upon their true value, a rate equal to the rate paid by property taxed under the general tax law. The suggestions here submitted pertain to railways organized as corporations, and whose chief business is that of transportation.

The significance of that last phrase is that in Michigan we have a large number of small railways which run to the mines of ore, and are logging roads, or adjuncts to manufacturing industries, whose value is not so much that they carry freight for the public as that they are an adjunct to manufacturing, mining, and lumbering industries. Now, those roads do not have this rule applied to them. The value of those roads, it is assumed, is reflected in the value of the manufacturing plant [reading:]

Second. It is understood that, as one step in this investigation, the commission has undertaken to appraise the physical property of railways (real estate included)—

The purpose of inserting that phrase is, as I have suggested, the difference of opinions that may arise as to whether the theory of the cost of reproduction can properly be applied to real estate. That was decided in the affirmative by the commission, and that was one of the given elements of the problem submitted to me. [reading:]—

and that the request made of me is to formulate a satisfactory rule for appraising the nonphysical or immaterial element in railway corporations.

Third. It is submitted that this nonphysical or immaterial element is not a simple commercial element, but includes, among other things, the following

1. It includes the franchise (a) to be a corporation, (b) to use public property and employ public authority for corporate ends.

In looking into the court's opinion or definition of franchise, it is made to cover a large number of diverse and sometimes contradictory ideas. One might say that the value of a franchise to be a corporation is what it costs a party for the charter, which perhaps in Illinois is \$3.50, but that, of course, is not what the commission is after in seeking for a rule for appraising the feature of intangible property [reading:]

2. It includes the possession of traffic not exposed to competition, as, for example, local traffic.

3. It includes the possession of traffic held by established connections, although exposed to competition, as, for example, through traffic that is secured because the line in question is a link in a through route.

That appears to me to be rather an important consideration. As an illustration, I imagine that some of the value of the Lake Shore Railway is due to the fact that it is a link in the through east and west line by means of which it secures a larger share of transcontinental freights. It carries the tea, for example—or it did until a short time ago—to the exclusion of the other rival roads. Whether it continues to do so I do not know. I imagine again—another illustration—that the Lake Shore and Michigan Southern road will be benefited by this purchase—by this combination, if it goes through, of the Vanderbilt systems with the Central Pacific—because, again, it will have drawn over its line a larger amount of transcontinental traffic than heretofore. So it is with any great system which, by means of its connections, enjoys certain through traffic; and that is one of the elements that goes to make its value, and that can only be included in the intangibles, if included at all [reading:]

4. It includes the benefit of economies made possible by increased density of traffic

It is a fundamental law of transportation that the more dense the traffic, other things being equal, the cheaper can the traffic be carried. The reduction in the cost per ton per mile follows the increase in the volume of traffic carried. Now, merely as an illustration to what an extent density of traffic can go, I have brought in here a map showing the extent to which the mail traffic of the United States has concentrated on a few lines. There are but a few roads indicated on that map [referring to map], yet on those few roads over 50 per cent of the mail matter of the United States is carried. The density of traffic is indicated by the width of the line. The widest line is between Philadelphia and New York.¹

Now, I imagine that there is no such corresponding density either in passenger or in freight traffic as in mail traffic, but the map is submitted merely to show what is meant by density of traffic, and to lead to the conclusion that the road with the most dense traffic is, other things being equal, the most valuable road, and that the advantage of this density of traffic, which decreases the operating expenses as compared with the gross income, must be classed among the intangibles of the corporation, and if valued at all must be valued under the head of intangible properties [reading:]

5. It includes a value on account of the organization and vitality of the industries served by the corporation, as well as of the organization and vitality of the industry which renders the service. This value, consequently, is, in part, of the nature of an unearned increment to the corporation.

¹The map referred to by the witness is in the book entitled "Railway Mail Pay.—Testimony taken by the Interstate Commerce Commission to investigate the postal service." Part II, p. 231.

Fourth. As corroborating the existence of this element of value in all successful corporate enterprises, reference may be made to the following facts.

1. Corporations almost universally are bonded for an amount in excess of the value of physical properties less the proceeds of the stock issued. If traffic or good will or franchises or organizations can be made security for the borrowing of money, is it not evident that they possess an established commercial value?

2. It is not uncommon for courts, in placing railway properties in the hands of receivers, to defend their action by the assertion that the step is necessary in order to prevent the disintegration of the property. Is it not a legitimate conclusion from this fact that the courts recognize organization as an element of value?

It was the case with the Northern Pacific, if I remember properly, in the petition for the receivership, which was to the effect that if the receivership was not granted the road would be disintegrated—that is, fall apart in its various sections, and could not be operated as a system easily—and the court recognized that argument, and the large number of receiverships in 1894 and 1895 made use of that phrase in their receivership petitions [reading]:

3. The universal recognition of the necessity of supplementing the general property tax by some special method of taxation in the case of railways is an acknowledgment of the fact that the general property tax by ordinary methods of assessment does not attach itself to the full value of corporate property. The general property tax worked well when the major portion of property was material and visible; it failed to work well when, through the development of corporate enterprises and credit relations, immaterial values came to be relatively significant.

I have a compilation of the laws of the States on the matter of taxation, and it is true in one way or another that all the States make, or most of the States make, an exception from the rule of the general property tax in the matter of railway properties, thus acknowledging that they must be approached by some different method [reading]:

Fifth. Inasmuch as nothing tangible or visible gives support to the value under consideration, it must be determined on the basis of information secured from the current accounts of the corporations. There are two accounts which may be used for this purpose, namely, the general balance sheet and the income account. In the balance sheet will be found a statement of assets and liabilities, giving cost of road and equipment on one side and the put value of stocks and bonds on the other. For reasons that need not here be stated, these items are not satisfactory for the purpose which this commission has in view. It may be assumed that the appraised value of the physical property of railways (including franchise element in the right of way) will not coincide with the balance-sheet statement of cost of road and equipment.

Now, there is no doubt but what the statement is correct. In the case of the Ann Arbor road, for example, the balance-sheet statement of the cost of the road and equipment is, if I remember rightly, \$14,500,000 of tangible, and the intangible value of the road will fall under \$7,000,000—not much over \$6,000,000. Now, on the other hand, if you should take the Lake Shore road as a general system—I am giving this merely on a guess, for we could not, of course, appraise that portion of the Lake Shore that lies outside of Michigan—take the Lake Shore road, and its intangible and tangible values arrived at by methods we have gotten out, would, I think, exceed its stocks and bonds. They have about \$95,000,000 of stocks and bonds. I think their aggregate valuation would go much higher. Of course that brings up the point that the value of roads may be appraised by the market rate on its stocks and bonds. Now, we endeavor to get at that in Michigan, to find out what the market rate of stocks and bonds was. I have here a statement, as closely as we could get at it, of the valuation of Michigan properties on that theory. Of all the railroads in Michigan there were only 4 of which there was a sufficient number of quotations of stocks and bonds so we could arrive at anything like a reasonable valuation. And another reason against that method of valuation for State purposes is that, even though you get that valuation, it is the valuation of the system; then there still remains the further question how to assign the value of the system to the State. For these three reasons that was abandoned and another method adopted [reading]:

The practice adopted by many States of appraising railway property on the basis of the market value of stocks and bonds has something to be said in its favor, but it is not satisfactory. This point, however, need not be argued at the present time, because this commission, by instituting an appraisal of the physical assets of the corporations, has committed itself to a rule inconsistent with the valuation of corporate liabilities.

In discarding the balance sheet as the basis of valuation, the commission is forced to accept for this purpose the income account, a conclusion which finds support in the established rules of corporation finance. The task of appraising railway properties, undertaken by this commission, is akin to, if not identical with, the revaluation of railway securities, should this become necessary for reorganization or for transfer. As stated by Mr. Greve, an authority upon this subject, the holder of railway properties "must accept as a basis for revaluation of his securities the earning power of the company as a carrier of traffic." This "earning power" is undoubtedly the basis of all valuation of corporate properties, and it is the income account from which this earning power can be determined.

Another reason for accepting the income account railways as a basis for the appraisal of immaterial values is that the rules of bookkeeping, so far as this account is concerned, are fairly uniform for all railways, and in the main rigidly followed. This is especially true so far as it is necessary to make use of the income account for the purpose of this commission. The degree of accuracy attained

In this account may be suggested by reference to the official classification of operating expenses adopted and followed by the principal railways of this country, a copy of which is herewith submitted. I also submit in this connection the form of income account prescribed by the Interstate Commerce Commission and followed by the majority of State commissions.

Now, I submit, Mr. Chairman, in this connection a copy of that official classification, the object being merely to substantiate the statement that, so far as the expenditures are concerned, the established rule is a rule that has been carefully worked up, and from my knowledge of the roads I may say that it is fairly well followed by the roads of the country. This particular account has received the approval of the convention of State railroad commissioners, and is made the basis of practically all State reports. It is accepted by the Auditors' Association, and willingly—indeed, of their own volition—has been put into force among the railroads. There doubtless are some inconsistencies in it, as there must be in any such analysis of expenditures, and they are of sufficient importance so that the executive committee of the National Association of Railway Accounting Officers is at present engaged in the revision and betterment of this account. I say this because it is so frequently asserted that railway accounts are of no advantage to any public commission, because they can be modified and cooked. To some extent that doubtless is true; but I think we are at liberty to say that, so far as operating expenses are concerned, the roads are loyal in their use—follow as strictly as possible the rule here laid down. There is some liberty granted in the use of this account which strict application of public supervision over accounts would not allow; but I think we may have some confidence in the operating-expense accounts of the railroads [reading]:

Sixth. The rules submitted for the appraisal of the immaterial values of railway properties, or what I prefer to term the capitalization of corporate organization and business opportunity, is simple, as follows:

1. Begin with gross earnings from operation, deduct therefrom the aggregate of operating expenses,¹ and the remainder may be termed the "income from operation." To this should be added "income of corporate investments," giving a sum which may be termed "total income," and which represents the amount at the disposal of the corporation for the support of its capital and for the determination of its annual surplus.

2. Deduct from the above amount—that is to say, "total income," as an annuity properly chargeable to capital—a certain per cent of the appraised value of the physical properties.

3. From this amount should be deducted rents paid for the lease of property operated and permanent improvements² charged directly to income. The remainder would represent the surplus from the gross earnings from the year's operations, and for the purpose of this investigation may be accepted as an annuity which, capitalized at a certain rate of interest, gives the true value of immaterial properties.

That is the form of computation. The report goes on next to say [reading]:

Seventh. To obviate the criticism that both gross and net earnings vary from year to year, it is suggested that in place of a single year's income account the average income account of a period of 10 years be accepted as the basis of computation. The reason for accepting a period of 10 years is that under existing commercial conditions it is likely that the corporation whose property is appraised would, during that period, pass through years of both prosperity and adversity.

Now, in one case I know of had we accepted the last 6 months' earnings on a certain road in Michigan and computed our intangible value from these earnings, we should have had some millions of intangible property, but if we took the average earnings for a period of years, the intangible property of the road was materially reduced. In two cases in connection with Michigan roads the reverse would have been the case. Now, it seems when we are getting at the real true value of property we ought not to take the accidental earnings of a particular year, but we ought to get the regular, orderly, steady year-by-year earnings. And finally this letter is closed [reading]:

Eighth. It will be observed that the above rule fails to appraise the speculative element in railway property. While this element doubtless affects the price of corporate stocks and corporate bonds, it is not entirely clear that it should influence appraisals for the purpose of taxation. Should, however, the commission desire to compute the present worth of property, as resting upon expectations in the future as well as upon earnings in the past, the pertinency of the above rule would not thereby be impaired. This is true, because the speculative value of properties must, from the nature of the case, be a modification of their value computed upon the basis of their earning capacity.

HENRY C. ADAMS.

¹The Michigan system of railway accounts prescribed by the railroad commissioner includes taxes in "operating expenses," and for the purpose of this analysis such inclusion may be accepted.

²Some improvements are charged to "operating expenses," but for the purpose of this analysis such a rule bears no significance.

I submit a blank sheet which gives details of this method of procedure:

Statement showing computation of the value of the nonphysical elements of the above-named road whose physical elements were, on November 1, 1900, officially appraised at \$——.

[Average annual statement for ——— years ending ———]

Items	Amount for entire system.	Per mile operated.	Amount apportioned to Michigan.
Number of miles operated.....			
Gross income from operation.....			
Operating expenses, exclusive of taxes.....			
Net income from operation.....			
Net income from investments.....			
Total available corporate income.....			
Annuity deducted for capital at 4 per cent of value of physical elements.....			
Remainder available for other purposes.....			
Further deductions			
1. Taxes on physical elements at 1 per cent of value.....			
2. Rentals on property not covered by appraisal.....			
3. Interest on current liabilities.....			
4. Permanent improvements charged to income.....			
Total further deduction.....			
Surplus.....			
Deficit.....			
Capitalization of surplus at 7 per cent, which results in a value of nonphysical elements such that the surplus yields a net income of 6 per cent thereon after payment of tax of 1 per cent thereon			

Remarks, ———.

There are quite a number of rather intricate problems possibly in connection with the use of this sheet, and I may just refer to one or two of them. In the first place I may review the theory. We begin with gross earnings from operation; subtract from that the operating expenses, exclusive of taxes. That leaves us the next item—net income from operation. We add to that the net income from investments; then we have the amount of money that the corporation has to dispose of. Now, in an ordinary income account, there would next be deducted the fixed charges; that is, interest on bonds, and after that the dividends on stock. But by this method of computation, in the place of interest upon bonds, there is deducted a certain rate per cent upon the appraised value of the physical property, which recognizes that the appraised value of physical property is a fixed capital in the concern, and that fixed capital ought to have a certain amount of income set aside for its support; and then beyond that, after two or three other deductions, if there be a surplus, the surplus is capitalized.

Q. (By Mr. LITCHMAN.) Is it pertinent to ask right here what relation the stock and bonds bear to this classification as stated by you?—A. We disregard the stock and bonds and substitute for stock and bonds in this operation account the appraised value of the physical property. That is what I mean by saying we get rid of the balance-sheet items. Now, a balance-sheet item means nothing.

Q. It could be cooked?—A. Well, yes; that is, it does not stand for anything in particular. They have on one side of the balance sheet the cost of the road and equipment. In the case of Ann Arbor, as I have pointed out, the cost of the road is \$14,500,000; we find upon investigation something over five millions of property, yet, on the other side of the balance sheet there are stock and bonds to the amount of fourteen million and a half. I am glad you asked the question, because that is a significant feature of this method of procedure. It is a means by which we get rid of what may be called the overcapitalization through overissue of stocks and bonds.

Q. You also arrive at the fact whether there has been an overcapitalization or an overissue of bonds?—A. Yes.

Q. That is to say, if the value by your method is less than the par value of stocks and bonds issued, the natural inference is there has been an overissue or

rather, an issue not justified by real value?—A. I think that is a just statement; yes.

Q. (By Mr. CLARKE.) And yet, how can the corporation, in dealing with its stockholders and bondholders, do otherwise than to accept the balance-sheet items as the basis of its computations in all its business arrangements?—A. I should not object to that in the least, but I think that comes entirely outside of the question which we are considering, of arriving at the true value of the property as an industry.

Q. It may be outside of it as far as the question of taxation is concerned, or a possible public regulation of rates; but, so far as concerns any possible winding up of the concern and distribution of its assets among creditors and among stockholders, they would have to proceed upon that basis, would they not, instead of this?—A. Undoubtedly, as representing their relative claims upon whatever value the property had, but if the concern is wound up it does not by any means follow that the value of that concern equals the par value of the stocks and bonds outstanding. The value of that concern would be arrived at in exactly the same way we are arriving at it here, on the basis of its earning capacity, and then in the distribution of that value, of course, it would be necessary to take into consideration the holders of outstanding stocks and bonds. And also it ought to be said, I think, as possibly giving some further light upon that point, that this physical appraisal does not necessarily cover the total value of the property. We allow that physical appraisal a certain rate per cent, so that what you might call the physical property in the concern will be supported out of the income. Then there is or is not excess. It may be there is such an excess, and when capitalized and added to the physical value the sum may exceed the par value of the stocks and bonds. It may be that it will not equal the stocks and bonds. But in any case it seems that the merit of this method of procedure is that it gets rid of making use of balance-sheet items.

Now, any scheme of appraisal must, of course, rest on something not arbitrary. It must be judgment. Another advantage in this method of procedure, as it appears to me, is that it allows of but one question of judgment—that is, the question of judgment centers in the proper rate per cent. The proper rate per cent, what we have stated, is 4 per cent, to which is added 1 per cent for taxation, assuming that the corporation pays the tax. That is the assumption upon which the investigation proceeds.

Q. (By Mr. LITCHMAN.) Taking no account of how the corporation eventually reimburses itself?—A. No; it takes no account of that. Of course, a corporation might perhaps be in no situation to recoup itself by raising its rates. Without trying to arrive at the proper rate per cent, we said that the investment which pays 4 per cent without taxation at the present time will command par. Therefore we took that 4 per cent. The reason why we took 1 per cent as representing the tax was peculiar to the conditions in Michigan. The average rate of taxation in Michigan is about \$14.75. The average appraisal of property is about 65 per cent of its par value. Therefore we reduced this to a par basis of 1 per cent.

It may be asked, Why not capitalize the net income to begin with and not undertake an appraisal of the physical properties? The chief reason for that lies again in the matter of rates per cent. That would have made it impossible to allow for the physical capital at one rate per cent and to capitalize at a higher rate per cent. The rule that we have adopted is to take 4 per cent for an annuity and to take 6 per cent for the capitalization, the reason being that the first income is a sure income. It is without risk, for we have decisions in our courts to the effect that no legislature or commission can reduce a rate to a point which will not pay. In some cases it is said to be the interest on bonds, but the idea is expressed more carefully by the recent Minnesota case—it is a State case, to be sure—a certain rate per cent upon physical valuation of the property. Now, then, you have a judicial bulwark, as it were, against a reduction of the rate of interest below 4 or 5 per cent, below the physical valuation of the property, and the cost of reproducing the property. When, however, a road presents a value in addition to this physical valuation, then that value does not, as it were, give a fixed income, because legislatures are at liberty to depress rates so as to deprive the corporation of a part of that value, for we must remember that railways, as it were, are between the upper and nether millstone. The State taxes them on one side and regulates rates on the other. Now, it seems, so far as this excess value is concerned, that there was some risk attending it, and in common equity it ought to be allowed a higher rate per cent than in the case of an investment that had no risk. So that one of the chief arguments for going through this expensive and difficult process of arriving at physical valuation is that it permits a separation. It permits the use of two rates per cent—a low rate per cent for

the amount assigned to the physical valuation and a higher rate per cent for that assigned to the nonphysical valuation.

Q. (By Mr. KENNEDY.) Is there any allowance for the depreciation of the property?—A. The allowance for the depreciation of the property is made when the cost of reproduction is greater than the present value. In such items as rails, ballast—all those items that do depreciate—the present value is always lower than the cost of reproduction. In engineering it is the same because there is no depreciation in those items. Now, this 4 per cent is the amount taken out of the earnings and set aside to the support of what you may call the necessary physical capital of the road. It takes the place in this income sheet of the interest on bonds in the given income and in part the dividends on stock. I say in part because it may be the money, it depends upon whether the interest on bonds consumes the net income or not. That would vary in different roads.

Q. (By Mr. FARRINGTON.) In case a railroad is found to have no net income at all over its running expenses, what would be the action of the State in collecting this tax?—A. Do you mean where there is no surplus after paying the operating expenses?

Q. What position does it leave the State in as to collecting the tax?—A. That is rather an intricate question in taxation. In a strict application of the theory it would seem to me that the State would not be at liberty to assume that the physical valuation of the property was its true valuation, and we ought to reduce its value below the cost of reproduction. At the same time that is not done in other properties. A man puts up a house in a place where he thinks he is going to rent it, and it turns out that people do not want to rent it. Now, in a sense, perhaps the local appraiser will let up on his taxes, but he does not very much, and he has to pay taxes whether it is a source of income to him or not. Now, for the same reason it would seem to me not to be equitable for any man to pay a tax upon any property that is not a source of income to him while it is not a source of income; and I should say that in the case that you state the appraisal ought to be reduced.

Q. As to that arbitrary annuity of 1 per cent, the roads are entirely different, no 2 alike. So would it be fair to take, for instance, the Ann Arbor or the Grand Haven or the Michigan Southern, and apply the 4 per cent theory arbitrarily to all 3 roads?—A. It is quite true that roads vary in their conditions, they vary in their prospects, and the speculative element undoubtedly makes their bonds fluctuate up and down. We have not thought it wise, however, to make a variation on this annuity, but we do make a variation in the rate of capitalization. Now, there are 3 cases of variation in the rate of capitalization. Let us take, for example, the union depot company of Detroit, the Fort Street Depot Company. That is a terminal corporation; its income is a contractual income; it is just as sure and certain as that the sun rises. Now, in that I apply the capitalization because it is sure. On the other hand there is a road, I think, up in the northern peninsula that is new; it has only been running about a year and a half; it has not come to that point where it is necessary to raise its operating expenses very high for deterioration. In 2 or 3 years you will find its operating expenses go up. Now, in that case I capitalize it at 10 per cent so as to reduce the value. There is another case of a road that has been a very prosperous road in the last 10 years; been running into a lumber camp. But the lumber is all cut off, and the last year you see it is gone. So if you take the past 10 years it is of high value, but its prospects are such that it is not going to be valuable in the future; and therefore I make a variation, but not in the deduction for the annuity.

Q. (By Mr. KENNEDY.) This investigation of yours is not entirely for the purpose of taxation. Is it not true that you design to ascertain whether passenger and freight rates are just?—A. Yes; provided a scheme of this kind could be put through by the Federal Government. I doubt if any State commission could make much use of a scheme of this kind or of any scheme to judge of the reasonableness of rates that they had to deal with; but I am confident that if the Federal Government should put through a scheme of this kind, so that the results would command the confidence of the courts, they would apply the principle of that State case up there in Minnesota—*Steenerson v. The Great Northern*. I think it is—in 1897, where the principle laid down was this: That a rate or scheme of rates which permitted a 5 per cent payment upon the reproductive cost of that road was reasonable. Now, you know in a great many cases the reasonableness of the rate finally comes down to whether or not the corporation can pay the interest on its bonds. The difficulty with that is that the bonds do not represent the real cost of the road or the real value of the road. If you could substitute in all that line of reasoning the true value of the road or its physical valuation, why, then, it seems to me you would have something that courts and commissions

could work upon. In that sense this scheme has a much broader application than the question of State taxation.

Q. But taxation was the only thing that was thought of in Michigan in setting up this commission?—A. Taxation was the only thing that was thought of there.

Q. (By Professor RIPLEY.) Do you recall any other case besides that of Steenson, in Minnesota, in which the reasonableness of rates depended upon the cost of reproduction of the property?—A. There is one Minnesota case in which that opinion was reaffirmed, but outside of that I do not know.

There is another advantage, it would seem to me, in a scheme of this kind—something of this kind being done by the Federal Government. Everyone who knows the difficulties that exist in connection with the State taxation of railroad property must welcome anything that looks toward uniformity. Now, I would take into that general subject the State taxation of interstate properties. The amount that railroads pay in taxation varies all the way from \$30 a mile up to \$900 a mile, and the schemes for getting at the thing are various; no two States have the same method of procedure. If the States are to continue, as probably they will, to tax these interstate properties, there ought to be some uniformity; and I imagine that if the Federal Government should establish and make a statement by proper investigation of the present value of railway property, especially of its physical elements, that the States would accept it and adjust their taxing scheme to it.

Q. (By Mr. LITCHMAN.) How long do you think it would take, approximately, to make such a valuation of so much of the Vanderbilt system as reaches from New York City to St. Louis?—A. It would depend upon whether there were any lawsuits involved. So far as the matter of collecting it is concerned, with properly paid men, I should think you could do that work in 2 months. I would say this was rather an expensive piece of work in Michigan on account of the shortness of the time that was permitted to do it. It had to be done inside of 4 months.

Q. (By Mr. KENNEDY.) It would not be so expensive another time, would it?—A. Oh, with this in existence and the proper officer in the railroad commissioner's office you can keep up depreciations and improvements from year to year.

Q. (By Mr. LITCHMAN.) Having made this examination as to the present value of any line of road or all the lines of the United States, and then supplementing that with the bookkeeping that you suggest in these tables that you have submitted, would it not be possible then to continue the knowledge of the exact physical conditions of such road or roads?—A. It certainly would if Congress will give the officers sufficient power to require the reports.

Q. And require uniformity in them?—A. There is now in the form, the annual form of report that the railways make to the Interstate Commerce Commission, a page calling for all this information. But in the reorganizations that have taken place the corporation that accepts the property does not care anything about the book accounts of the previous corporation, and it does not take them over and report to us. They do not know anything about it. Then again, a lot of building of roads is by contractors. A contractor builds a road and he keeps these accounts—he may or he may not—he may keep them in his vest pocket. When he turns the property over it is turned over to the railroad as so much money paid to the property, so that the road does not get these accounts; and I doubt very much if any of the Michigan roads at least have as perfect an analysis of their property as is now in the possession of the State of Michigan.

Q. The point I wanted to cover was how much value it would be to get an appraisal of the railroad properties of the United States under this system unless it was supplemented by some means of continuing that knowledge up to date?—A. I think that the machinery of the Interstate Commerce Commission is now ample to secure the continuance of that year by year, with one exception. The Interstate Commerce Commission has now no authority over the contractor. If a law were passed by Congress or by the States or in any way so that the people who build the roads under contracts should file reports under this rule, under this classification, then there would be no difficulty in keeping the thing up to date.

Q. (By Mr. CLARKE.) Do you think Congress has any constitutional warrant for making such a general appraisal?—A. Appraisal?

Q. Yes; or for passing a law ordering such an appraisal?—A. It is with great hesitation that I speak on a constitutional question, for I am not a constitutional lawyer. But it would seem to me that inasmuch as Congress has undoubtedly control over the rates charged by interstate roads, and in view of the fact that 99 per cent of the roads in this country are interstate roads, that Congress would also have the authority to authorize any step necessary to the establishment of or arriving at the through rate.

Q. You think that the rate of taxation is an important element in the matter of rates of transportation, so that Congress would therein find its warrant under the power to regulate commerce?—A. I should hardly put it in that way. I should not rest the right of Congress to do this upon the interest it may have indirectly in the question of taxation. I should put it directly upon the principle that Congress has control over the rate in interstate matters, and this is desirable for the purpose of judging what is or is not a reasonable rate.

Q. (By Mr. A. L. HARRIS.) Do you mean by that scheme to get the valuation by the Government and then give it to the States—prorate that valuation; or do you mean for the Government to assess the tax?—A. I had not thought of going so far as to reorganize the taxing system of the United States; no. My thought was this: That if the Federal Government should in an authoritative manner estimate the values of the interstate railway properties, that the States themselves then would accept that valuation as the basis of their own taxation and come to some understanding between themselves as to the apportionment of that value between them. I am ready to admit that that is a very difficult question, the question of properly apportioning the value—especially this intangible value—of a railroad to the various States through which the railroad runs. That is an exceedingly difficult question.

Q. Would it be satisfactory for the States to take it by the mileage within the States, prorate by the mileage within the States?—A. I think not. I should think that would do injustice in many cases. In Michigan, for example, it would permit Wisconsin to get more than she ought to for herself. I had not thought to go into that problem this afternoon, but I can suggest, I think, the difficulties in the pro-rata rule. Suppose there is a State, as Michigan, for example, and there is a road like the Lake Shore road, we will say, from Toledo on to Chicago, that runs along through the northern part of Ohio, through Indiana, and through Illinois, and it has a few branches sticking up into Michigan. Now, the question immediately arises: What is the value of those branches to the Lake Shore system; how much do they contribute to the Lake Shore system? They contribute not simply the earnings from freight on the few lines that are in Michigan, but they contribute a value to the Lake Shore system in view of the fact that all the freight that is collected by those branches in Michigan gets a long haul clear from, let us say, Elkhart on to Buffalo. It is common in railway finance for the main stem to support a branch which in and of itself does not seem to pay expenses, simply because it recoups itself for the loss there by what it earns on the long haul. Now, a per mileage assignment of this value as a basis of taxation does not seem to me to meet the equities of the case, for in that case Ohio would get more of the value for taxation and Michigan less than she ought to get.

Q. You can not find any constitutional provision at all to control it?—A. That undoubtedly is the right of a State; but still the subject being taken up by Congress, here is this information; and then the question of solving this awful, awful question of State taxation comes to be simple, and I think we may rely upon the fact that State legislatures are more or less reasonable and would do that thing.

Q. Is it not a fact that many of the States get much more from interstate railroads in the way of taxation than other States?—A. Yes.

Q. Although the road passes through the different States?—A. That is about the truth.

Q. Of course, I do not want to mention names as far as the States are concerned, but there has been one of the greatest troubles in getting at the true valuation for railroads in the past; and it seems to me a scheme like you have outlined, if it could be taken hold of by the General Government and then could be adjusted between the States, would be a relief not only to the States, but also to the railroads.—A. Undoubtedly; and the only other alternative is for the Federal Government to undertake the taxation of interstate roads. I do not know whether it has the right to attempt that. I do not know but what the States would object to that, because they are getting about \$40,000,000 of income.

Q. This appraisement was actually made, was it, or is it merely a scheme?—A. Oh, no; this is done. The report on the intangible matter has not been completed, but the other is done, and the State legislature will act upon it this session.

Q. Then the other question I was going to ask will not be pertinent, for the reason that I wanted to find out how the valuation under this plan compared with your present plan in reaching the value.—A. We do not value roads at all in Michigan now. The tax is a specific tax upon gross earnings, roads being classified at different rates for the different classes. And the purpose of this investigation was to find out whether, under the special taxing rule, they paid equally with other property. The result of the computation, I might say in general, is that the values do not mount as high as the advocates of the ad valorem scheme of

railway taxation claimed, but it does show that they are paying relatively less than other properties.

Q. (By Mr. CLARKE.) This appraisal, then, will not necessarily lead the legislature to do away with the present system of taxation?—A. No. It was in our constitution that the other system of taxation was required, but at the last election an amendment was offered to the people and voted overwhelmingly that the ad valorem method might be used, and the matter was adjusted at the last session of the legislature.

Q. Now, you have studied this scheme. What is your opinion as to which is the better of the 2 methods of railway taxation?—A. It seems to me that that question can only be answered in view of practical conditions, and in view of practical conditions in Michigan I should say it would be wise for Michigan to undertake the ad valorem scheme of taxation, because the people of this country are not yet ready to establish, as it seems to me they might well establish, a distinct scheme of corporate taxation.

Q. It would be an ad valorem scheme of appraisement rather than of taxation, I suppose, because the local tax rates would be based upon the general appraisal, would they not?—A. Yes. On the matter of tax rates there are quite a number of unsettled problems. Now, when I say that the general rate is about \$14.75 in Michigan—why, in some counties it is much higher and in others it is much lower. But, of course, the question immediately arises whether, in the attainment of equality of taxation between railway corporations and other property, railway corporations should be taxed uniformly at the average rate throughout the State or taxed on their property within districts at the rate existing in the district. That is a question that is not yet settled, so far as I know.

Q. (By Mr. A. L. HARRIS.) Is your present system looked upon as being constitutional beyond a question?—A. Taxation of gross earnings?

Q. The system you have now in Michigan—gross earnings.—A. No case has ever arisen to test it. Perhaps that is the proper way to put it. However, I hesitate to talk law now. I think there was a case there which resulted in showing that this method was legal, for in Michigan we do not tax on the gross earnings of the entire system, but, by the reports to the railroad commissioner, only the earnings within the State of Michigan are taxed, and for them you must first find the earnings on local freight, which is all credited to Michigan, and then, under the rule, a certain portion of interstate earnings would be credited to Michigan; so that it is the gross earnings within the State. And in that way I understand it is constitutional. I hesitate to follow that answer out, because I know nothing about law.

Q. (By Mr. KENNEDY.) When you finished reading your paper you said you had 2 or 3 observations to make.—A. That has all been presented in this discussion. I was going to submit 3 reasons why it seemed to me it might be well for Congress to undertake the valuation of railroad property: First, because it would greatly assist in the development of a uniform system of State taxation of interstate property; second, that it is essential for the intelligent application of the theory of reasonable freight and passenger rates; third, it would enable the roads to supply what now they can not supply from their accounts, and in that way an annual statement of their property under the prescribed classifications. That was what I had reference to.

Q. There are some other topics, I presume, which you have in mind, upon which to give information to the commission—pooling, combinations, and so on?—A. If the commission wishes to hear anything more, I should like to say a word upon the necessity of more perfect control by the Federal Government of the accounts of railways. It is fairly easy to get up general principles, but it is exceedingly difficult to apply those principles. It occurs to me that our Government is all the time suffering from a lack of administrative intelligence rather than from a lack of moral purpose or general principle. Now, a great deal has been done through the agency of the Interstate Commerce Commission to establish uniformity of railway accounts. When I came into the office of statistician there was no uniformity of accounts either among the railroads themselves, or, what was worse, among the State commissioners. We immediately got together the State commissioners, and they agreed to assist us in working out a uniform blank for reports. We got together the auditors or the chief accountants of the railways, and they also saw the desirability of uniform accounting, at least so far as operation was concerned, and they assisted also in working out a uniform system of accounts. That classification of operating expenses that I submitted to you necessitated, for example, that all the Pennsylvania system should modify their books. They got up a new set of books for the classification of operating expenses. So that at present we have a fair degree of uniformity, and that has been kept up

from year to year so that we are moving on little by little in that direction. And it also ought to be said that the twentieth section of the act to regulate commerce gives, so far as language at least can do, to the commission the right to prescribe the accounts. Now, notwithstanding all that and as much as has been done in that direction usually through the assistance of the railroad officials themselves, it is nevertheless true that we have never exercised any coercion upon the roads, at least to any great extent, and that it has been found very difficult to go further in the direction of uniformity of accounting than the operating accounts. It has seemed to quite a number of those with whom I have talked upon this subject that it might be advisable, recognizing the public character of the railway industry, as it is recognized in law and in practice in this country, to establish a bureau of statistics and accounts and establish something of the relation between that bureau and the railways that now exists between the Comptroller of the Currency's office and the banks. Again the question of administration comes in and that is the difficult point; but from the point of view of desirability, general desirability, there can be no question, it seems to me, if the Interstate Commerce Commission and the State commissions are to perform the duties imposed upon them, that they must have access at first hand to the books of the companies; for each of those commissioners is in a sense the director representing the public interest in those corporations, and they ought to have a voice in the administration of those properties in very much the same way. That is one of the suggestions, a mere suggestion—that I thought might be wise to have in the records of this commission, as a matter that was at least worthy of the serious attention of people who are investigating the subject of railway transportation.

I might add that at the St. Louis convention of State railroad commissioners—by rather a close vote, it is true—that the policy was approved, but it was not carried any further. There are a great many points of detail in connection with railway reports and railway accounts that I might refer to, but possibly that would go too far into the details of operating.

Q. (By Mr. FARQUHAR.) Can you state some of the objections of the railroads to the unrestricted inspection of their accounts as interstate commerce roads by the Interstate Commerce Commission officers?—A. I suppose the most common objection would be that they can not trust the public officials when they get hold of them. I suppose that is where the shoe pinches, and that is a pretty serious objection. And I suppose they feel, too, naturally, that they know more about their accounts than anybody else and it would be something of an invasion of their rights. They might also feel to some extent that this would lead to the diffusion of secrets of administration. I know that that was true in the case of the lake carriers when, in connection with the last census, an investigation of the lake traffic was undertaken, and on some of the boats they had accounts of expenses and experiments that they were making that they did not wish to make public, and we could easily understand why that was true. And then, too, it is also said by the railroad men that the same rule of accounting does not apply to all conditions. But in answer to that we must recognize that much of the difficulty in understanding public accounts arises from the great diversity in railway contracts, and the great advantage of uniformity of accounts is that after a person has gone to the trouble of studying in detail the accounting of one system, he has the accounts of the entire system in the United States at his disposal and he can understand them: whereas now, there being no guaranty of uniformity, a man can never tell, even though he is acquainted with a system of accounting, by looking at a total what that total means. The chief advantage, as I see it, in a uniform system of accounts, properly supervised, is that every item in the account is defined by statute or defined by an administrative rule of the body or the office, so that when they see a total they know, without going through all the mass of figures, what that total means.

Q. Does not your Interstate Commerce Commission now demand uniformity?—A. We do; we demand uniform reporting; and, of course, the law gives the right for us to ask for special information; but that is quite a different thing from a regular established system of inspectors who shall see that the books of the railways are kept in conformity to the principles laid down.

Q. (By Mr. CLARKE.) Has any bill been introduced in Congress to provide for this uniformity that you recommend?—A. I think not. It is found in the recommendations of the commission in several of their reports, but no bill, so far as I know, has been introduced.

Q. (By Mr. KENNEDY.) I would like to ask you, if you are through with that subject, whether you believe the question of pooling is as live a question to-day as it was a few years ago, and whether it has not become an obsolete question?—A. I hesitate very greatly to answer any question on pooling, for I have not fol-

lowed the arguments right up to date. But if you will allow me to speak generally on that subject, I should say that probably the present tendency toward contractual consolidation is in part due to the inability of the roads to pool. So much would seem to me to be correct. And of course the practical conclusion of that is, if that be true, that Government control over these great consolidations is just as important as increased Government control had Congress seen wise to legalize pools. Therefore, if I was going to suggest what the line of wide legislation might be, I should say that provision ought to be taken for special grades in the case of these great properties.

Q. (By Mr. A. L. HARRIS.) As the statistician of the Interstate Commerce Commission, do you think that it is advisable to have reports from express companies as well as other common carriers?—A. Yes; you will find that as a recommendation in the last seven reports, I think. Most certainly. The express companies ought to be subjected to the same scheme of reporting as the railways, and on that matter also I should say that the private companies that furnish cars to railroads and receive from railways a rental per mile—those companies also ought to be brought under the supervision, at least so far as reports are concerned, of the Interstate Commerce Commission.

Q. (By Mr. FARQUHAR.) To your knowledge are there many of these car trusts now?—A. Do you mean companies owning private cars?

Q. Yes; companies that own the cars.—A. So far as private cars are concerned, there are immense numbers of them; yes. I think the rental that is paid amounts into the millions for those private cars. We have a list of them in the office; it is a long list. And if any property is still, laying aside and not used, it is not usually the property of the private car companies.

Q. Are there any companies now that have built cars and have rented them to the roads, as they did to the Erie road several years ago?—A. You mean what is called the equipment trust obligation?

Q. Yes.—A. There is, but it is gradually disappearing. The better roads are owning their own cars or else they are renting from parties outside who own them, on a mileage basis. These equipment trust obligations—a company took over a car and used it as its property, and then at the end of the year it paid 6 per cent of the value of the car and 2 per cent for an annuity, just like buying a sewing machine on the installment plan.

Q. (By Mr. KENNEDY.) I would like to ask you if you have any views you would care to submit upon the question of the desirability of enlarging the powers of the Interstate Commerce Commission or of vitalizing the powers it was supposed to have had when it was first created?—A. Yes; I have some very strong views upon that matter.

Q. Will you oblige the Commission with them?—A. It seems to me that it is always foolish to create a commission and assign to it a certain task and then not give it the tools with which to perform that task.

Q. (By Mr. CLARKE.) In case the Government should take over the roads some time or other and own them, do you think the basis of appraisal that you have adopted in Michigan would be substantially correct for allowing to the present owners of the road their portions?—A. I am inclined to think that it would, and in answering that statement I am reminded of the condition of the charters for all the French lines and all the Belgian lines and also of the method that the Prussian Government followed at the time that it bought its roads. In the charters granted the great companies in France there is this provision: First, that at the expiration of the charter the road becomes the property of the State by the payment for the rolling stock without payment for the right of way or the connections; second, that if before the expiration of the charter the Government desires to take over the roads it can do so by the payment of an annuity for the unexpired term of the charter equal to the average net earnings of the 7 years preceding the date at which the road is taken. That means, then, that the valuation of the French roads are practically that the purchase or condemnation of them by the Government rests upon the basis of net earnings of the road for the 7 years previous to the time that the operation is carried through.

Prussia purchased her roads at the time of or shortly after the panic of 1873, when stocks were down, and she made a careful estimate of the earning capacity, which was accepted by the Prussian roads. Now, this scheme is entirely in harmony with those principles. It rests upon the fundamental truth that the value of property is, all things considered, what it will bring; that is, what income it will give. I see no other way of getting at it than some such way as this.

Q. (By Mr. KENNEDY.) Do you desire these to be returned to you? Could you furnish one and put it in the testimony at the proper place?—A. Yes; I could do that.

Q. (By Mr. A. L. HARRIS.) In furnishing a sample, give us one of the older roads if you can. The name of the road you gave me was the Boyne City and Southeastern Railroad?—A. That is a State road that does not make report to the Interstate Commerce Commission. That happened to be one of these logging roads.

(Testimony closed.)

WASHINGTON, D. C., February 6, 1901.

TESTIMONY OF MR. JOHN W. BRYANT,

Secretary Steamboat Captains and Owners' Exchange, New Orleans.

The commission met at 11.08 a. m., Mr. A. L. Harris presiding. At that time Mr. John W. Bryant, river reporter of the Daily States, and Secretary of the Steamboat Captains and Owners' Exchange, New Orleans, La., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. KENNEDY.) Will you please give your name and address?—A. My name is John W. Bryant, New Orleans, La. I am the river reporter of the New Orleans Daily States and secretary of the Steamboat Captains and Owners' Exchange, New Orleans.

Q. Have you in your mind the order in which you would like to discuss the topics which you are aware the commission would like to get information from you upon?—A. Yes. I would like to make a little introduction first. I have this in mind to say: It has been perhaps boastfully asserted upon more than one occasion that while the traffic by railroad has been rapidly increasing, that by the river is correspondingly decreasing, and it is believed by some that the railroad has already practically displaced the steamboat; but neither of these propositions is correct. It is true that there has been a partial diversion of traffic from localities, while at other places there remains perhaps as much, and maybe more, traffic than ever before, and all this where the railroads parallel and cross the navigable streams. The annual report of the United States supervising inspectors shows that there are more steam vessels on the Mississippi River and tributaries to-day—last year and the year previous—than ever before. It has been pointed out that there is a loss of through traffic from such important points as St. Louis, the Ohio River, Memphis, and Vicksburg to New Orleans. But why? Not altogether because of the railroad or any decided preference for that means of transportation, but by reason of causes we are afraid the remedying of which is far removed. Of course the railroad commands business, and what it legitimately commands has never yet and never will seriously cripple the steamboat, but it is its illegitimate methods that are hurting the steamboat, the only rival they can never hope to control, the only investment that can never be absorbed or managed by trusts or syndicates. In face of a Federal law intended expressly to prohibit it, the railroad fixes and maintains unremunerative rates at river points while exacting maximum rates at intermediate points away from the river. In doing this it actually makes the producer at the interior noncompetitive points pay for losses resulting from its efforts to cripple and drive out its river competitor, an advantage and a policy which can never prevail on the river as long as the individual right exists to build and operate a steamboat.

Q. That is what you mean by illegitimate methods, is it?—A. Yes. The only remedy, however, for this injustice being suffered by a less favored community of interests is in the literal enforcement of the fourth section of the interstate-commerce law. Not fearing this law, because of their having always charged more for the longer than the shorter haul, some of the steamboat men have expressed a willingness to be included in the provisions of that law, provided, of course, it is strictly enforced to all carriers alike. But while this diversion has in part served its unnatural purpose, yet the steamboat survives, and will as long as there is a channel in which to run. Depressed as it now may be, it is a factor to remain always. But the struggle is not so much with the railroad as it is because of the conditions of navigation. There is a good and profitable business carried by the railroad which would go by the river instead were it not for the uncertainties and delays of navigation. The Government has contributed liberally, wisely, and properly for the improvement of navigation. Without it the steamboats might soon vanish from the face of the waters. The appropriations have been honestly and not wastefully spent, but it is a fact that

except in the territory covered by the Mississippi River Commission the results have not been what the steamboat men had hoped for or expected. Look at the Ohio River last year; except where there were lock and dam effects, navigation on that important river was entirely suspended for a season, with not a boat in service on that important waterway. There is the Missouri River. The steamboat men there will tell that they have been driven out of business, not because of the railroad, but by impediments to navigation, unmaintained channels, the snags and bridge piers, and the withdrawal of all insurance risks because of the too frequent losses on hulls and cargo. There is a river from St. Louis to Cairo. Let there be maintained a channel in that 250 miles of distance, of 9 or even 8 feet, and he would be prejudiced indeed who would then say the glory of the river had departed. And there are the tributaries, making up, as they do, the bulk of the traffic that is carried on the greater river. They become so difficult and impossible of navigation at times as to discourage the efforts of the most hopeful and persistent; and it is not alone the shoals and bars which hinder, but the greater perils of the snags, and of the faultily planned and located bridges that are allowed to be placed across these navigable streams, an obstruction the steamboat men think too indulgently and often allowed, in view of the Government's aid in behalf of these very interests they imperil. This uncertainty, delay, and danger of navigation justifies insurance risks all but prohibitive in effect, resulting in actual losses to the steamboats in service and the consequent additional loss of those in enforced idleness. This is the main cause of whatever decline there may be in the tonnage and commerce of the river, the restriction in operation, and discouragement of investment.

Q. Can you say how many bridges there are below St. Louis, for instance?—A. They are being built everywhere, especially across the tributary streams, where they do more harm. In the Ohio River the piers are not only a danger, but one bridge in particular is so low that during this last rise steamboats could not pass under and had to wait until the water fell. I suppose that the losses from the bridges on the Ohio River—and I do not think that the steamboat men would have any difficulty in proving it—have been enough on that river alone to pay for any bridges across it; and this not counting the loss of life, which has been great.

Now, in regard to statistics. It is an impossibility almost to furnish a full exhibit of statistics of the commerce on the Mississippi River, for the simple reason that nothing of the kind is kept. The railroads, of course, know every shipment that goes over their road. They have records sent to headquarters from every section; but the steamboat business is not kept up in that way. They have what are called "trip books," in which is entered the up and down freight of each trip, but further than that no record is kept; so there is no way of getting at the statistics on the Mississippi River except through some one who has the time and the opportunity of going to every boat, wherever she may be, and getting a copy of the shipments from these books. About a year and a half ago I was asked to do this service for the purposes of an article that was to appear in this volume I have before me on the riparian lands on the Mississippi River, that was being gotten up by Mr. Tompkins, and I undertook to do that work, but my time was limited, as were my opportunities, and there were some boats I could not get to; so in making it up I left these boats out and made no computations at all except on the copy I had. Some 12 or 15 years ago, while the river reporter on the New Orleans Times-Democrat, I prepared a statement of the commerce of the river coming into New Orleans for the 2 years just before the beginning of the construction of the Eads jetties and for the 2 years after their completion. I only did it for my own information. I had plenty of time. I was at the work a whole year, copying the manifests of the steamboats, and, in summing conclusions, I found that about one-third of the traffic of the river had been diverted through the development of the railroads. I gave that copy afterwards to the Mississippi River Commission, and it was published in their annual report, and I believe it was the first and, maybe, only time a statement of the kind had been published. In the last census report the commissioner stated that he could not get complete returns of the commerce on the waterways, but he thought that over half of the whole commerce of the United States at that time was carried on vessels. Some few years ago the railroad interests concerned in the building of a bridge across the river just above New Orleans had prepared, for their own use, statistics of the river. Of course, if there was any coloring to it, it was in favor of the railroad; and they put down the diversion of business at 34 per cent. Now, I have in this book some statistics, prepared last year. If the commission thinks it of value, I will copy it off before I leave.

Q. It is just a table, is it?—A. Yes. It is not long. It is a showing of the commerce of the river, the tonnage of the vessels, and their values. I think you

would like to know that. It is short. It is all condensed here. In the first place, it shows that in the system I am speaking of, the Lower Mississippi River, there are 6,228 miles of river, of which 5,695 miles are actually navigable—that is, from St. Louis to the Gulf, taking in the tributaries of the Mississippi River. Now, in the Census Report for this system the total tonnage of the commerce is shown as amounting to 6,401,303 tons. The statistics I have here show 7,693,998 tons, which is an increase over the Census Report of 1890.

Q. For the same period?—A. Well, yes. That was for the year in which the census was taken, and mine is for this last year. They both cover a year's business. I found that 189 steamboats passed over the river in that time, and their net tonnage was 62,314 tons. They made 6,212 trips, the gross tonnage amounting to 1,590,004 tons, and the value of those vessels, which I got from the owners themselves, was \$1,331,000. Of barges—that is, vessels without steam, mostly towed by steamers—there were 1,635, and they made 2,470 trips, and their value is \$2,003,000, showing a total of 1,824 vessels in the year, with a net tonnage of 1,471,128 tons, and a value of \$6,334,000. This exhibit does not include the vessels engaged in harbor work; it does not include ferries across the river, nor any of the railroad transfer boats, and it does not include any of the Government steamers. It only embraces vessels actually engaged in commerce. The total amount in tons carried on the river from Cairo to New Orleans was 4,708,355 tons, the value of which was \$94,605,762. The coastwise and foreign tonnage from New Orleans to the Gulf via the river amounted to 2,985,643 tons, of a total value of \$144,704,136, making a grand total of 7,693,998 tons, and a total value of \$239,309,898. The principal commodities carried on the river were 612,242 bales of cotton, 166,049 tons of cotton seed, 153,664 tons of sugar, and 444,539,180 feet of lumber and logs.

Q. What proportion of the total did these barges carry?—A. Leaving out the cotton, seed, sugar, and logs, I suppose the barges carried about two-thirds of it. Here is one item included in this total—66,615 tons of steel rails, or nearly 3,500 carloads. This was carried on barges, towed all the way from Pittsburg, 2,000 miles, down to New Orleans, and there loaded on railroad cars to be distributed along the Southern Pacific route, an argument in itself showing that transportation under almost any condition is cheaper by water than by rail, because if the railroads could have handled it and earned that freight money they would have done so; but they could not do it so cheaply, so they sent it by the river.

Q. Can you give an idea as to how much cheaper the barges can handle freight than by rail?—A. I can answer that best this way: The rate on bulk grain from St. Louis to New Orleans by rail at this time is 10 cents a hundred. The rate in barges, with all of the difficulties and uncertainties and delays of navigation, is 3½ cents. There is a line of barges that has just been inaugurated at St. Louis which promises a revolution in the towing line. They are whaleback barges, built of steel. They are of lighter draft, and instead of being towed abreast by a large, heavy, expensive towboat, they are to be towed tandem shape by a smaller, lighter, less expensive propeller boat. The manager of this new line asserted publicly that if assured of navigation between St. Louis and Cairo all the year, if there was not less than 8 feet there, bulk grain would be carried to New Orleans for 2 cents a bushel. Now, the bulk-corn export from New Orleans last month was nearly four and a half million bushels. At the present rates, by railroad, the freight on that four and a half million bushels of corn would be \$25,200. At the present rate, by river, it would amount to \$15,750, a saving in favor of the river of \$9,450. But with the reduction to 2 cents, which will come when the navigation is improved, the saving would then be \$16,200, which would make a difference of nearly two-thirds in rates between river and rail.

Q. What are your return cargoes on barges upriver?—A. The return cargo is imports, very largely. The import trade at New Orleans is increasing quite steadily. It also consists of sugar and lumber, but largely sugar. We have 2 large sugar refineries in New Orleans, one of them having a capacity of 8,000 barrels a day. When the river is open to St. Louis sugar is shipped in quantities.

Q. What is the difference between up and down rates?—A. There is very little difference. The competition is so sharp, not only with the railroad, but among the steamboats, that the rates are pretty uniform; they change but very little. The only change that takes place in river rates is mainly on account of the condition of navigation. When the river is low and there is trouble in getting over shoal places and time is lost, they try to get a little more; but when the river is full the rates are low.

Here is a good evidence of that, in a statement made before Congress by Mr. McRae, member from the Camden (Ark.) district, who, in speaking for the

improvement of the Ouchita River, said that when there is navigation the rate on cotton from Camden, 700 miles, to New Orleans, by river, is \$1.25 a bale. When the river is down and boats can not run and it goes by rail, which is 647.5 miles, it is \$3.10 a bale. The rate on flour is 35 cents a barrel by steamboat, 75 cents by railroad; the rate on boots and shoes, all water, from Boston to Camden, is 79 cents a hundred; by railroad, \$2.02 a hundred.

Q. (By Mr. LITCHMAN.) Do they have to break bulk on the railroad?—A. No; these rates are generally given by the carload. That is the general way of giving the rates.

Q. (By Professor RIPLEY.) Is the practice of classification coming into use on the river?—A. It is being generally adopted by steamboats, because they must follow railroad methods. If I remember correctly, at the time this question of the operation of the fourth section of the interstate-commerce law was being considered by the Interstate Commerce Committee, the railroads made the plea then for the nonenforcement of that section on the ground that the steamboats fixed the rates and they were at the mercy of the river. The steamboats know now that the condition under that action has been altogether changed, for it is the railroad which fixes the rate and the steamboats are altogether at the mercy of the railroad. Conditions have changed greatly, and for that reason the steamboats must follow the methods of business of the railroads. They have to take the railroad rates, whatever they are, with the insurance differential. Take cotton, for instance: The insurance differential on cotton is 25 cents a bale. The railroads have fixed the rate from Memphis to New Orleans at 85 cents. That is the present rate, but it has been 50 cents, and as low as 30 cents. Of course, the steamboats could not meet those rates. They can not even touch it now at 85 cents, because, having to allow the insurance of 25 cents a bale, it leaves the rate at 60 cents for a carriage of 800 miles; so they let that cotton alone.

Q. (By Mr. KENNEDY.) That is from what point?—A. Memphis. Natchez is also a railroad point. The rate there fixed by the railroad is 50 cents, so if a steamboat carries at that price and allows 25 cents for insurance, she gets but 25 cents; so she does not take a bale from there, either. Now, the difference between the railroad and steamboat is this: All the way along the river there is no place where cotton is over \$1 a bale, and from that it goes down to 50 cents. It is graded all the way, but the railroad, while taking cotton from Memphis at 85 cents, at points away from Memphis they receive anywhere from \$1.50 up to \$2 a bale. There is a point within 100 miles of New Orleans, off from the river, where they get \$2 a bale for cotton. The steamboat in line with that point on the river carries it for 50 cents.

Q. The railroads, then, are not observing the long and short haul clause of the the Interstate Commerce Commission?—A. No; that section was suspended by the commission. They allowed its suspension at river competitive points.

Q. (By Professor RIPLEY.) In the Louisville and Nashville case originally?—A. Yes. The Louisville and Nashville were the principal parties to it at first, but it has been extended to all railroads alike where they are in competition with the steamboats.

Q. What is proposed in view of the late decision of the United States Supreme Court practically negating the long and short haul clause of the interstate-commerce law?—A. That, inasmuch as the several State railroad and steamboat commissions, notably in Texas, Louisiana, and Mississippi, are endeavoring to establish a proper reasonable tariff at points within the State, why should the interstate carrier be excepted and not held amenable to any law? If the interstate-commerce law was intended to protect and promote commerce, why should a carrier in an effort to force or destroy a rival at a competitive point, be justified under that law in exacting disproportionate unreasonable rates all along the non-competitive points of its line? In other words, if a railroad seeks to destroy or cripple the steamboat, why not at its own cost, instead of at the expense of helpless communities entirely removed from such competition?

Q. (By Mr. CLARKE.) The cotton bale to which you refer, I suppose, is the ordinary cotton bale, and not the round bale?—A. Yes; the round bale amounts to very little so far on the river. Out of 78,000 bales exported from New Orleans in 1 day recently, there were only about 4,300 round bales.

Q. Do you know whether or not either the boats or the railroad companies make any discrimination in favor of the round bale?—A. I do not know much about it. I do not think they make a discrimination in favor of it, because they would rather handle the flat cotton; they can store it better and carry more of it than round cotton. I know that is the case, particularly with exports, because the steamship men have said they don't like to handle the round bales; they can't put as much cotton in a space as flat cotton; and I would not suppose by that that they would make any discrimination in favor of round cotton.

Q. Is it not a fact that the round bale contains practically double the weight of cotton that the oblong bale does?—A. No; it is quite the contrary. They reckon 2 round bales to 1 bale of flat cotton.

Q. Is it not a fact that the same space contains double the weight in the round bale as compared with the oblong bale?—A. Well, it takes 2 round bales to make 1 bale of flat cotton. I suppose it would not take so much space perhaps as the flat cotton, but flat cotton can be handled better, stored better on steamboats, where the freight is piled up. I suppose you have seen it. They carry cotton out on the guards 10 or 12 bales high—they almost hide the boat. They could not do that with the round cotton. They could not hold it in mass. It would be liable to tilt and capsize the cargo into the river.

Q. Do you know what the facts are concerning ocean-going vessels that freight at New Orleans?—A. I know very little about that.

Q. You are not aware, then, that they make a discrimination in favor of the round bale?—A. I do not know that at all. I only gave you the answer that one steamship agent in New Orleans made to me; that he would rather not have the round bales, because they can't be stored like the flat bales; they can't take as many round bales. That is, they can't store them as compactly in the same space as the flat bales. I suppose you have seen the difference in size between the compressed and the original bale. They will just screw that in a solid mass, almost. They can't do that with the round bale. There are vacant spaces in between they can't screw together at all, but the flat bales can be screwed into a compact mass.

Q. (By Mr. LITCHMAN.) That is double the weight, then, is it not; 2 round bales is equivalent in weight to a flat bale?—A. It is 1 flat bale to 2 round bales.

Q. Well, is not that a saving of space to that extent?—A. They can't store it so well. If you take a lot of boxes and pile them up in that corner there, you can make a solid mass of them, but you can not so pile up barrels.

Q. Do not 2 round bales of cotton weigh more than a square bale?—A. No; you have just the same weight. It is generally rated 2 round bales to 1 flat bale.

Q. There is nothing to gain, then, in the movement of cotton by the round-bale process?—A. Of course, the argument in favor of the round bale is that it is less liable to take fire, less susceptible of damage. The flat bale is very much exposed, and they put very cheap bagging about it, and not enough ties, and the cotton is more exposed to fire, damage, and waste.

Q. (By Mr. A. L. HARRIS.) Have the freight rates heretofore been regulated by space or weight on steamboats?—A. Well, they have not been regulated by weight, because, up to recently, the steamboats carried freight by package and by measurement. If it was a barrel of flour, or a barrel of beans, or a barrel of potatoes, it was carried at so much a dry barrel; molasses, vinegar, whisky, oils, at so much a wet barrel, and boxed goods at so much a box. Large cases and crates and casks were measured and carried by the foot. But now, since the adoption of the railroad methods, they are carrying it all by weight.

Q. (By Mr. KENNEDY.) Have there been any attempts at regulation of rates on the river, or is it competition altogether?—A. No; no attempt at regulation, because it is simply an impossibility. Take New Orleans, for instance; there are 30 steamboats that are owned and operated out from New Orleans. There are only 3 lines there, one of these lines owns 3 boats, which have nothing to do with any of the other boats. Then there is another line which operates boats in Red River, owning 6 or 7 steamers, and they have nothing to do, practically, with the other boats. And there is another line which owns 4 boats. That makes 3 lines owning 18 boats. The other 17 are individually owned and operated, with no connection with the other lines in any manner, shape, or form, so there is no attempt at regulation there, and there can not be. If all those boats would go into 1 line, they would have just the same experience over again, as in other cases where attempts were made to control a trade—somebody outside having a boat would think it a good place for him to get in, and the combination would be off.

Q. No attempts at combination?—A. There was an attempt made some years ago by steamboat men to get all the steamboats from Memphis to New Orleans to consolidate, but it was given up. They could not get them to agree to it at all—it was just an impossibility. It was like the remark said to have been made by Commodore Vanderbilt to the president of a great steamboat line, who went to New York to get Mr. Vanderbilt interested in the line. He asked just one question: "Do you own the track?" "No." That ended the negotiation. That is the condition. Nobody owns the river, nor the trades, and I suppose never will.

Q. Well, are any lines owned by railroads, or operated by them or for them?—A. No; there is no railroad ownership that I know of. The only investment I know of the railroads having made was in the purchase of an interest in a line of

boats out from St. Louis a few years ago; but the line is no longer in existence, and that ownership was not publicly known.

Q. (By Mr. A. L. HARRIS.) That is one line of transportation that is owned and controlled by the Government?—A. Yes; in the interest of the people.

Q. (By Mr. KENNEDY.) Is there a surplus of boats on the river at the present time?—A. No. As I say, there is too much trouble and loss in navigation to encourage investments in that kind of property. There was the Anchor Line, running from St. Louis to New Orleans—about the finest line of steamboats we ever had on the Mississippi River. One year every one of their boats—and they were very large and expensive boats—was idle for 7 months. They did not turn a wheel—not from want of patronage, but because of interrupted navigation. Such enforced idleness would destroy any business. There are a great many boats on the Ohio River, and more tonnage is carried on that river than all the other rivers in the Mississippi Valley together. There was a time quite recently that there was not a single steamboat running because of interrupted navigation. There was 5 feet 7 inches in the lock and dam system of the river, and only 1 foot 3 inches of water at other places in the river.

Q. Was there ever a time when there was a surplus of boats in traffic season, when the water was at proper depth?—A. Well, just after the war, and for some time after, there was a surplus of boats; but there is not now. Of course there are new boats building all the time. When boats are lost or placed out of service they are replaced.

Q. Can you tell us something about the cost of boats, the size, and insurance rates?—A. The cost of a boat varies. It depends a good deal, in the first place, on the ideas of the man building it. Some men build boats more costly than others, in different ways. Then it depends a good deal on the trade it is built for. But the cost runs anywhere from \$20,000 up to \$100,000. There is no fixing upon any particular price. It depends on conditions.

Now, the insurance that steamboat men speak of as being so prohibitory in effect, is that on hulls, which runs anywhere from 8 to 18 per cent. It is as high in some tributary trades as 18 per cent, and it is kept at that figure for the reason that the navigation is considered dangerous. There are no rocks in hardly any of the streams, but it is the snags that accumulate there all the time. They are not always removed properly. The Government appropriates the money for that work, but we do not think the service is as efficiently rendered as it might be. The trouble is they generally commence operations too late. They wait until the river gets too low, and oftentimes before much work can be done the snagboats have to quit because of the low water. And sometimes the snags removed are deposited along the banks. The next rise picks them up, and they get back into the channels and cause destruction. And then another element in the insurance rates is the bridges. I have never heard a steamboat man yet object to bridges. They know bridges must be built across the rivers and they do not oppose them, but they do object to the manner in which they are often built and located and made a menace to life and property. There is no question about it at all. I do not know any steamboat men who would willfully tie up and say they could not get by the piers at times, unless there was a danger; and I do not think they would run into a bridge just simply to prove the bridge dangerous. We have the delays in passing these bridges, and we have accidents and losses, and we believe the Government should be a little more considerate of the river interests and less indulgent of those of the railroad, and not disregard entirely the interest of navigation or impair it. There is hardly a bridge proposed that the steamboat men do not have to go and fight for their interests. And then they are put down as kickers, as trying to oppose the railroads crossing the rivers.

Q. Are there any of the fine passenger boats on the Mississippi River, like those before the war or just after the war?—A. Well, the methods of business on the river have changed. People who live on the river now, or travel on the river, don't see those great fine boats passing as before. Many think it is because there is no longer the business. In the days of those greater, finer steamboats, the bulk of the traffic was carried from St. Louis to New Orleans, and from there distributed back up to local points along the river, but now the bulk of the traffic which goes from St. Louis is distributed at these points direct. A boat now carrying 1,600 to 1,800 tons of freight will put out 1,200 tons of it before she gets to New Orleans, going into New Orleans probably with a third of a load. But the greatest change is in this: The railroads will carry freight, for instance, to Memphis, to Vicksburg, to Natchez, and Baton Rouge, and at each of those places are established local lines of packets, which carry the freight up and down from those places, so that instead of the through traffic as before, it has become largely local. The traffic is on the river just the same, but it has changed altogether in distribution. Before this

time I speak of there were none of these local packets at all. Vicksburg did not operate boats up and down the river, nor did Memphis, except those running to the White and Arkansas rivers. Now, at Natchez there are two lines of steamboats where there was none before. One line runs from Natchez up to Vicksburg, and the other runs from Natchez to Bayou Sara, and instead of the through boats handling that traffic and travel, it is largely done by local boats.

Q. (By Mr. FARQUHAR.) Have you any line of passengers from St. Louis to New Orleans?—A. There are only two boats running through, but they lose so much time on their trips they do not carry many passengers. The same is to be said about the Cincinnati and New Orleans boats.

Q. Is the Anchor Line still in existence?—A. No.

Q. What facilities have you in New Orleans there for the transfer of grain from barges to ocean-going ships?—A. Well, we have them nearly perfect. We have 2 systems there. For instance, there is the Stuyvesant wharf. It was built by the Illinois Central Railroad. It has a very large modern elevator, and another is building, to cost a million dollars. The Texas and Pacific road, across the river, nearly opposite the Stuyvesant wharf, has a large elevator, and is building an additional one; for the bulk grain business of New Orleans is increasing more rapidly than at any port in the United States. In fact we are the second port now in import and export values. There is also a large elevator at Southport. At Chalmette there is a very large elevator; and then we have barges, that is, hulls, with elevators—movable elevators. We have both methods and they are very complete. There is never any delay there at all in the transfer of grain.

Q. Is there any complaint about the condition of grain coming from whaleback barges?—A. No.

Q. Was there any complaint under the old barges?—A. No. There has been some talk away from home of the grain not being delivered in good condition, but that has been exploded officially and positively by all authorities connected with the export of grain. We had a case there some years ago. A ship loaded with bulk grain, in passing out of the mouth of the river, got aground and was detained there some time, and it was during the hot weather. It was thought then that that was about as good a test of the grain's condition as could be had. The ship had to return to be docked and repaired and was unloaded. When the grain was taken out it was found in just the same sound condition as when it went in. There is nothing in that at all. There is no damage to grain handled in our climate.

Q. Is flour carried down to New Orleans and shipped to foreign countries?—A. Yes. Flour exports are increasing.

Q. Do you know what countries, principally, breadstuffs go to from New Orleans?—A. Most everywhere.

Q. Have you any Central American trade from there?—A. Yes.

Q. Where does the flour go to, the West Indies and Central America?—A. Central America and Havana get the bulk of it. A good deal goes to Europe.

Q. (By Mr. KENNEDY.) Did you state what influences determine the minimum rates—the lowest rates on the river?—A. That is the only rate that prevails now—minimum rate—and it is just as low as it can be.

Q. You said that was forced by the railroads?—A. Yes; that has been forced by the railroads, because we either had to take it at the railroad rate, or as near to it as we could get, or else not get the freight. When a boat makes a low rate to any point that rate affects much of the distance that boat goes over. We can not charge 25 cents on a barrel of flour to one point, for instance, where it has a railroad, and then get 40 or 50 cents to another nonrailroad point. We can not do it; the conditions will not allow it. We would like to do it. If we could do as a railroad does, we would not then care if there was or was not an interstate-commerce law.

Q. Is the navigable season more irregular and shorter than it was 25 or 30 years ago?—A. Yes; and we think that is due principally to the denuding of the forests. The water now comes down in the shape of freshets, and it passes off quicker. It forms in less time and passes off quicker. And then another cause of that down in the lower part of the river is the levee system. Before the system was what it is now there were large basins, and the river would overflow and fill up all those great swamps, and the water would lie there and gradually drain back into the river, and it would prolong the rise. But now that has all been leveed either by the railroads or by the people themselves, and all that water is confined in the river, so it is in the same condition in the lower end of the river as in the upper end where the rises come from. Our freshets come mainly from the Ohio River. We are never troubled with water from the Missouri and the Upper Mississippi; they are not considered by us at all. Our floods come from the Ohio

River, but the upper part of this river has been so filled up by corporations making more building room that the river has become very narrow and the water forms and runs out very quickly. Sometimes a big rise at Pittsburg will last hardly long enough to get out two runs of coal, it passes off so quickly, while years ago before these changes had taken place there would be water for one or two months.

Q. Can you illustrate what you say about the great corporations narrowing the Upper Ohio?—A. That has been a subject before Congress and legislation was enacted to stop it, and I think it is pretty well stopped. But they did take up a great deal from the river, and it was a subject of much complaint by the steamboat men because it was making the river too narrow to handle their business in. You see they make up great coal tows there to go down the Mississippi River. We had a coal tow go down the Mississippi River some years ago, made up of 54 boats, of over 50,000 tons of coal. There must be room in which to handle a tow of that kind. Coal is brought from Pittsburg, 2,000 miles, down to New Orleans for 75 cents a ton—that is about the highest they ever get. One of the coal operators and owners of those tow boats said that if assured of navigation, and were it not for the bridge piers, he would contract to deliver coal for 60 cents a ton, and make money out of it.

Q. Does any coal go by rail?—A. No; not from Pittsburg to New Orleans. It can be handled much more cheaply by boat than by rail. They have coal dumps which dump from the mine into the boats, and the boats carry anywhere from 900 to 1,000 tons. The tows are made up very quickly, and when there is plenty of water they go through rapidly.

Q. (By Mr. CLARKE.) Does that coal business go on throughout the year?—A. No; they only ship when there is a rise in the Upper Ohio at Pittsburg. The shipments are nearly all from Pittsburg. We sometimes run out of coal in New Orleans. Our shipping interests are increasing so very greatly and there are so many more steamships coming there now than ever before, that this last season we had to get nearly 400,000 tons, part rail and part water, from Alabama. The Pittsburg supply gave out; there was not water enough for the runs. The coal was in Pittsburg, loaded on the boats, but there was not the water for delivery, so we had to draw upon Alabama, and the difference amounted to nearly 400,000 tons. You see coal consumption has been very largely increased on account of the war with the Boers. Many steamships have come to New Orleans for horses and mules, and they take all the coal they can carry, perhaps 4,000 or 5,000 tons to a ship—not less than 3,000 tons anyhow.

Q. Bituminous or anthracite?—A. It is what we call soft coal; bituminous.

Q. (By Mr. KENNEDY.) Speaking about the vessels used in the Boer trade, have you any knowledge of the vessels of other countries supplanting the vessels of Great Britain in the trade at New Orleans as the result of transports going into that South African business?—A. The English vessels have not been supplanted. They have drawn out that much—from the foreign trade. It has crowded others coming there that much more. The English tonnage is increasing all the time at New Orleans, more rapidly than that of any other country, and there comes again the navigation question. In the Eads jetties, at the mouth of the river, there has not been a sufficiency of water for the largest steamers that have been built for the New Orleans trade recently, and there are anywhere from 40 to 45 vessels that have to go out with less than a full cargo on account of lack of water. They go short sometimes as much as 3,000 tons, because there is not enough water for their full carrying capacity. Under the contract which expired a few days ago there was only 26 feet of water required at the jetties, and these ships could load to 28, 29, and 30 feet. Now we are to get an appropriation from Congress to open up another pass and give 35 feet of water; when that is done not only will a larger number of ships come there, but the ocean rates will be materially lowered.

Q. (By Mr. LITCHMAN.) Have you thought out what effect it has in lowering the water in the upper part of the river?—A. The jetties?

Q. The depth of that water at the mouth of the river?—A. No, it has had no effect at all, because there are three passes at the mouth of the river, and the effect of the jetties has not been to draw off the water any sooner. All the river section below Vicksburg is a basin. Now, awhile ago I spoke about how soon the freshets passed out from the Ohio River. For 3 or 4 years I kept a record of the rise and fall of the river at New Orleans. I took the time when it would get even with the edge of the wharf and went above it until it fell, and the longest period was 107 days in 1894.

Q. The difference between 26 and 35 feet, 9 feet more of fall, it seems to me would have an appreciable effect?—A. No, it would not drain off the water from the river, for this distance of several hundred miles, more than before.

Q. (By Mr. FARQUHAR.) What is the relation of the three bayous there to the main level of the gulf—pretty near the same, are they?—A. They are the same, yes. There was recently a survey made of the Southwest Pass. There have been 5 other surveys by the Government in the last 60 years, and 20 years ago the South Pass was deepened from 9 feet to 26 feet, and yet the observations were that there had been practically no change in the mouth of the river. The conditions were just about the same at the mouth of the river for 60 years, and these surveys showed it.

Q. (By Mr. CLARKE.) Will the jetty system be employed for opening the new pass?—A. Yes.

Q. It is a success then?—A. Yes, only the engineers propose to reverse the proposition. Mr. Eads's proposition was that the jetties would be self-maintaining; they would maintain the channels themselves with the scour that they produced; but he also used a dredge as an auxiliary. Now, the present plan of the engineers is to depend almost entirely upon the dredges and use the jetties as an auxiliary; that is, they are going to deepen the channel with the dredges and use the jetties mainly as a protection to the channel, which is open and exposed at the mouth of the river. The wind blows from all directions and sand is carried by the waves, so these jetties are intended to keep the sand from being blown over into the channel, as well as to serve their other legitimate purposes.

Q. Has the draft of ocean-going vessels been increased very much since the construction of those jetties?—A. Oh, yes. Why, when Mr. Eads made his contract with the Government the conditions were that he was to be paid so many hundreds of thousands of dollars when he obtained 20 feet, so many at 22 feet, and so many at 30 feet; but when he got to 26 feet he thought he had better stop. He thought that depth was sufficient. By act of Congress the President appointed a special board of engineers to examine and report as to that, and in their report they said that they thought 26 feet was sufficient for all time. Well, it did appear so then, but it is entirely insufficient now, because, as I say, we have vessels that can load to 32 feet. New York Harbor, you know, got an appropriation lately to increase the depths from 35 to 40 feet, because it is thought 35 feet is insufficient. At the port of Liverpool some \$8,000,000 or \$10,000,000 were spent on the dock system, and they are now spending \$9,000,000 more to deepen the harbor so as to make room for the larger vessels. I read a few days ago that a contract had been let to build a vessel for the North German Lloyd Line, 1,000 feet long, to draw 35 feet of water. At the time of the jetties about the longest vessel we had coming in there was 350 feet. We have vessels coming now 500 feet long. It is the great increase in the carrying capacity of the vessels that has cheapened transportation so much.

Q. Has there been any improvement made in the construction of the jetties?—A. No; there has been no change made. Eads simply contracted with the Government to maintain 26 feet of water. The Government had nothing to do with the means adopted. The pass was turned over to him. He owned the lands and the plant, and the Government allowed him \$100,000 a year for maintenance, and he had to keep up the depth out of that \$100,000. But the Government had nothing to do with the work any more than to send an engineer officer down there to make soundings and report, so that payments could be made.

Q. How are the new jetties being constructed and maintained?—A. The new jetties will be constructed under direction of the Government engineers.

Q. Not by contract?—A. The work will probably be done by contract, but under the Government's supervision and control.

Q. (By Mr. KENNEDY.) Can you tell us about the character of the labor employed on the Mississippi boats and the wages paid?—A. Yes; the officers of the boat are all white, but the labor is all negro. There are very few white men employed as roustabouts, because they can not stand the work. The banks are high in low water and the weather is pretty hot, and it is just about the hardest work there is to get the cargo on and off a steamboat, and about the only laborer we find that can stand it is the negro, and we have to pay very high for it. On the upper rivers, where the traffic is altogether different from what it is on the lower river, they have mixed crews; some of the boats have half white and half negro, and some have all white crews—a very few. But the most of them have all negro crews and pay anywhere from \$30 to \$40. But down with us, in the packet trades, we have a different kind of freight to handle and we have higher banks to put it on. The conditions are different. We pay anywhere from \$40 to \$110 a month for labor. We call them roustabouts. They call them deck hands on the upper river boats. And there was one instance where they were paid at the rate of \$125 a month. The boats are only out from 8 to 6 days on a trip, and they are paid at that rate.

Q. (By Mr. CLARKE.) Is board furnished in addition to that?—A. Yes.

Q. (By Mr. KENNEDY.) How much work in a year would that labor have?—A. The labor does not work steady; they are all the time changing about. A boat will never have the same crew any 2 trips in succession. The roustabout is a very peculiar individual. He does not care about saving money or having a home, and does not care much about a family; he has no moral obligations, hardly, of any kind. All he cares about is playing craps. When paid off, out of a crew of 30 or 40 to 50 men, why, perhaps 5 or 6 men will have all the money of the whole crew—win it after they are paid off. They are generally paid just before they get into port, and perhaps a majority of them will leave the boat without a dollar in their pockets. They are very improvident; they like to change about and go on one boat one time and then another the next time, and maybe the next time they will go up the river several hundred miles into another trade; so that they are all the time changing crews. It is very seldom they have the same men any 2 trips in succession.

Q. (By Mr. CLARKE.) What is craps?—A. It is a game of dice. I must say that while I have seen it played and heard a great deal of it I do not know anything about it. They throw three dice and call certain numbers.

Q. It is a gambling game?—A. Yes.

Q. Is it prohibited by law?—A. It is prohibited in Louisiana; like a good many other laws, though, not very strictly followed. The steamboat men would like to break it up, because it is demoralizing. They would rather have men of better condition, financially and otherwise, than they are. But the steamboats can not get along without them, and they want the very best of them, because it is only the very best of men that can stand that kind of labor. You do not find any old men or any weak men among them; they are all strong, vigorous young fellows, and they have got to be to stand the work. The steamboat men would rather see them better off, and would help them if they could. The steamboats provide messrooms to eat in, and tin pans and knives and forks and cups; but the men would much rather have the food brought out in a dish pan and put on deck and take it in their hands and eat it. That satisfies them better. They do not care for a table or a service or anything of that kind. There are places provided for them to sleep in, but they never go there, because they want to hide from the mate when they make a landing and dodge the work. They will hide amongst the freight. And if it is cold weather or rainy they will go right down underneath the boilers and sleep there in preference, where a white man would burn up. That suits them better than sleeping quarters. As I say, they are very peculiar individuals, but they are the very best labor there is, and we could not get along without them, and when they come high, well, we take them just the same; we have got to have them.

Q. (By Mr. KENNEDY.) Are there any exceptions to this rule of conduct that you speak about respecting them, where men are saving and acquire property from that kind of labor?—A. There are many among the negro population of New Orleans who are saving. Negroes are employed everywhere in New Orleans. I do not believe there is a branch of business that negroes are not employed in. And there are many negroes who own their own homes, educate their children, and live a good and comfortable life. But there are many just like these roustabouts. It does not cost them anything for education, because the white people pay for it—furnish the schoolhouses—just the same as for the whites. There is no difference in the instruction or in the cost of it, and the teachers are paid by the white people. They have to pass the same examinations as the white people do.

Q. (By Mr. LITCHMAN.) Are the teachers for those colored schools white or colored?—A. Both. There is a deal of trouble, though, to get colored teachers, because they will not study up for the examinations. We try to get the best, but have to take an inferior grade because they will not try to excel.

Q. (By Mr. KENNEDY.) Have the roustabouts families?—A. Some of them; but they mostly go to what we call barrel houses, where they sell liquor and have dance halls and crap games, and where the commonest kind of women frequent. That is their place. When a steamboat wants a crew the officers often go to the barrel houses to find them.

Q. Have any attempts been made to organize them into a union?—A. Oh, yes; they have organizations, but they does not amount to much because they do not hold to them very well.

Q. Does it have anything to do with fixing the rate of wages—the union?—A. It has a great deal to do with it. The negroes stand together very well, though, without these organizations. When a steamboat is ready to ship a crew the mate has shipping tickets, and he goes out to the end of the stage and some negro will

ask, "What are you paying?" "Fifty dollars." Well, if they have made up their mind that they want \$60, some of them call out \$60 and they will all say \$60, and will not ship unless it is promised. While they may have their organizations, they do not amount to as much as their combinations right on the spot. I do not know whether they prearrange them or not, but they are in effect just the same, and that is the way they do it. But their labor unions have given the steamboats little trouble. There is very little clash between the steamboats and the negroes. The steamboats, of course, have to pay such high wages at times, and think they are being imposed on, but they pay.

Q. Have the Italians taken to that work?—A. We did try them. Two boats hired Italians, but had to give them up. The Italian is a peculiar laborer also. The Italians could not understand English. They had an interpreter through whom the mate gave the orders, and they were liable to pick up any package on the boat and run ashore with it whether it belonged there or not, and there was a great deal of trouble on that account. And they were not strong enough. They are small men, not equal to the work, and after 2 or 3 trips they were discharged, and the steamboats went back to negro roustabouts and paid higher wages. They had paid the Italians \$60—\$2 a day—and board. Had they proved good labor I suppose they would have been hired altogether, but they would not answer. There were only 2 boats hiring the Italians.

Q. (By Mr. F. R. QUHAR.) In the general stevedore work on the docks in New Orleans do you use Italians?—A. No; there is very little of Italian labor except on the fruit ships. That is altogether Italian labor. The Italian contractor unloads fruit vessels, and he employs none but Italian labor. The other labor has been, up to recently, mostly white, but now the negro is making inroads into that employment. They work cheaper and are gradually displacing the white stevedores. Still there is a large number of white men employed in loading cotton and unloading the cargoes. But that is altogether different labor there from what we have on the river. That is steady labor; they work in the same gangs; they do not change at all; they form a very close corporation.

Q. What view have your commercial men in New Orleans taken of the opening of the Nicaragua Canal?—A. We think New Orleans will be helped immediately and more largely than any other city in the United States, so we are very anxious for its construction.

Q. What preparations have you for building boats at New Orleans?—A. The Navy is establishing a large dock there. That will lead to the establishment of a shipyard. We have built vessels there from time to time in all these years, occasionally building a steamboat, but there has not been much encouragement for that kind of work, because it seems that they can build better on the Ohio River than anywhere else. I do not know exactly why, but it is so. They hardly ever build a steamboat in New Orleans; generally go to the Ohio River for it.

Q. Where are all your Mississippi and Missouri boats usually built?—A. They are built, almost all of them, on the Ohio River. Shipyards have been established there ever since the first steamboat was built. We occasionally build little boats along on the tributaries.

Q. (By Mr. KENNEDY.) Have you a fruit trust at New Orleans that sends fruit by boats to different ports?—A. Yes; some people call it a trust. It is a company called the United Fruit Company; came there in the last year and bought out all the other companies in New Orleans and put them under this one management. There were a number of companies there. I think there were 13 different companies, all operating independently of each other and all owning vessels; but now they are all consolidated. Men that were most largely concerned in those companies seem to be out of them altogether. They are engaged in other business; they do not import fruit; they do not own any steamships.

Q. Does this trust control the banana and other foreign fruit trade of the United States?—A. They control all that trade in New Orleans.

Q. And really all the trade in the United States, too?—A. I do not know so much about that.

Q. (By Professor RIPLEY.) They not only raise the fruit but transport it—that is, they own the steamships?—A. Yes; they have bought fruit plantations on the other side. They own the product and the ships that carry it.

Q. Do they ship directly themselves to interior points in the United States?—A. Yes.

Q. Do they own cars?—A. No; they do not own cars; they deal directly with the railroads.

Q. Do you know anything about the rates?—A. No.

Q. Whether they get special rates?—A. No; I do not. There are 3 railroads engaged in the fruit business, the Northeastern, which owns a fruit wharf; the

Louisville and Nashville, and the Illinois Central have their fruit wharves. They all handle fruit rapidly and economically in New Orleans. A ship comes in there at any time, and whether it is 9 o'clock in the morning or 9 o'clock at night, she is unloaded at once and within a few hours the fruit is all on its way from New Orleans; it never lies there at all. The ripe fruit that will not bear transportation is sold in the city.

Q. (By Mr. FARQUHAR.) Has this combination raised prices to the consumer?—A. Well, I do not know that; they claim they have not. I believe they claim that the object was to lessen expenses and make their profit therefrom.

Q. There has not been complaint against the prices then?—A. No; not by small dealers, because they buy bananas at retail just as cheap now as they did before.

Q. (By Mr. A. L. HARRIS.) Have you any regular line of vessels plying between New Orleans and foreign ports?—A. That are owned in New Orleans?

Q. No.—A. They are all foreign lines.

Q. To what ports?—A. To every port in the world. We have 14 different lines of steamships that come to New Orleans, regularly consigned to agents, all the year round—every trip they make. Two of the lines which are located in New Orleans are the two largest lines owned in America—the Leyland-West India Line and the Elder-Dempster Line.

Q. (By Professor RIPLEY.) Is that the same Leyland line which runs from Boston?—A. And New York; yes. I do not know very much about the steamship traffic. We ship to Cuba, but those shipments are carried by the Southern Pacific Line, an American-owned line. There are no foreign steamers engaged, of course, in the coastwise trade.

Q. (By Mr. A. L. HARRIS.) You have tramp steamers, I suppose, call at your port?—A. Yes; and they come consigned to the regular agents of the lines to which they belong.

Q. Of course they do not run regularly?—A. No; they may make a few trips, but they go everywhere. They are liable to come from Belfast to New Orleans, and then maybe from New Orleans to South America, and then from South America to New York, maybe from New York to Australia. There is no telling where they go.

Q. You have no American line?—A. No; not in the foreign business. There are American lines, but they are in the coastwise trade, like the Southern Pacific and these fruit lines; and then the New York Cromwell Line. We have, I suppose, not less than 1,400 steamships coming to New Orleans in a year.

Q. You were speaking a moment ago about having no river statistics. Would you advise the Interstate Commerce Commission's taking up that feature and compiling statistics of the river trade?—A. I think it would be a mighty good thing for the river interests if it were done, because there is a growing impression that the traffic on the river is leaving it, that the rivers are hardly worth improving any more; and if they were to get up these statistics, then, and only by that means, would it be known just how much commerce there is on the river. Its value and the extent of it is not known. There are no full statistics furnished to Congress. The United States engineers who are assigned to different districts make an attempt every year to gather this information. They send out blanks to different steamboat lines and to the different owners of steamboats, and where the owners manifest a proper interest in it they fill out those blanks and send them back, showing the number of trips made, where to, and the number of passengers and tons carried, the draft of their boats, and the size. But there are a good many of those blanks that are never returned; they do not always reach them, because maybe the boat has left her former trade and gone elsewhere. So that the engineers try to get a correct exhibit of the commerce of the river; and it is to their interest to do so, because it is the information mainly upon which they recommend improvements to Congress. These are about the only statistics that are gotten up, and they are incomplete. The commissioner of the census in his report said it was impossible for him to get full returns of the traffic on the river, but he guessed that over 50 per cent of it was by water. And that is the way with this effort of my own. I spent about 2 months on this work where I should have taken 4 or 5 months, in order to go to every steamboat and get the information from her books.

Q. It would be much better for the Government to gather the statistics than for a private individual?—A. Oh, yes; it would.

Q. They would respond to it better?—A. They would respond to it because they would like to have it known; yes. They would think it to their disadvantage to have it believed that the steamboat is not to be considered any more. They did not refuse to give information to the census commissioner about their traffic and their earnings and their profits and everything of that kind. All that information would be given again.

Q. Are the vessels doing the foreign trade fast vessels?—A. No, they are not fast like the New York vessels, because they do more freight business. There is a passenger travel from New Orleans, on these foreign steamers, to Europe, but it is only with two or three lines. The others do not care about passenger travel at all.

Q. What is the usual speed of the freight vessels?—A. I think it takes them anywhere from 14 to 18 days to cross the ocean.

Q. How many knots; or do you go by days?—A. I suppose anywhere from 10 to 14 knots; but they care more for the freight; they do not solicit passengers at all. Now, these great ocean steamers, for instance, like the *Deutschland*, do not care for freight; would rather carry fuel. Her passage receipts have amounted to as much as \$240,000 on a trip. This great 1,000-foot vessel they are building, the owners declare, will carry but little freight. They are making her an exclusively passenger vessel, because there is so much more money in the passenger traffic.

Q. Where does that vessel trade?—A. From New York to Hamburg.

Q. That would not apply to any of the vessels that trade at New Orleans?—A. No, because there is very little passenger traffic out of New Orleans, except the Cromwell line between New Orleans and New York. They do a very large passenger business. There are many of our people who like this voyage across the Gulf, and those vessels always go crowded in the summer season. Now, we have another line from New York to New Orleans, owned by the Southern Pacific Company, which is exclusively freight. The Cromwell line is passenger and freight. They have very fine vessels and do a large business.

Q. Is New Orleans interested in the subsidy bill?—A. There is a division of sentiment there, but I believe the large majority are opposed to that bill.

Q. On what ground?—A. On general opposition to the Government giving subsidies. There were a great many people who thought it was a mistake of the Government when they gave sugar bounty. It proved to be a mistake afterwards.

Q. Is it generally believed there that the subsidy as proposed to be applied would not benefit New Orleans traffic?—A. I do not know that traffic would be benefited very much in that way. We are doing a very great business now and it is increasing rapidly, as I say. Our exports and imports last year increased nearly \$25,000,000. Of course, we would like to see American shipping and American-owned vessels; we would have a pride in them; but we are not entirely satisfied that it is going to be accomplished in the bill now under consideration. Some of us think that may be a few lines would get the benefit out of it and others would not get anything. We have the statement of Mr. Hill, the president of the Great Northern Railroad, which he made public in Chicago, and he is a steamship owner himself. He says that a few vessels will get the benefit of that subsidy bill, but the large majority of them will not get any benefit from it whatever.

Q. If it were believed that most of the freight carriers across the Atlantic, trading at New Orleans, would get a proper share of the benefit of that, would that be likely to change the opinion of the people there concerning the subsidy bill?—A. Nearly all of the vessels crossing the ocean now are foreign owned; there are few American vessels. There may be a ship here and there, but there is no foreign American line of steamships in New Orleans. Of course if that was changed under this bill and they became all American-owned ships, the people of New Orleans would feel a great gratification in it. They are patriotic people there like they are everywhere else, but perhaps they are not as enthusiastic or as unanimously in favor of a ship-subsidy bill as in some other sections.

Q. Do you think they have an ambition to become owners of ocean-going vessels to any great extent?—A. They would like to see all these vessels American owned, yes; they would rather have that commerce carried under an American than under a foreign flag, but they do not know that it will be accomplished under this measure; there is some doubt about it. There are others quite active in supporting it, however. One of the most prominent of the steamship agents, Captain Miller, who has been in New Orleans many years, was president of the convention at Brunswick, Ga., a few days ago. He is very active in his support of the ship subsidy. There are others not taking part in it. Some of our commercial exchanges have indorsed it; others have taken no action at all. There has been no general concerted effort made to get an expression of the opinion of the people of New Orleans on that measure, so it is hard to say what they would recommend. They might be found largely in favor of it if an effort were made to ascertain the opinions of the people. But we talk very little about it there because we are going on well with what we have.

Q. You hardly feel the need of it so far as your traffic is concerned?—A. We do not think it would make any difference in the traffic. I do not think it would make freights any cheaper, because they are cheap now. The only thing that would make cheaper freights out of New Orleans would be more water at the mouth of the river. We do not think the subsidy would make them any cheaper.

Q. There is never any objection on the part of any of your people to liberal Government appropriations for the improvement of the Mississippi, I suppose?—A. No. As I said before, we would not object to the ship-subsidy bill if it would bring the benefits that it is claimed it will. We do not object because we want all the money for other purposes.

Q. Where do these foreign vessels touching at New Orleans get their crews?—A. They bring them; they are foreign crews. We have a law in Louisiana which prohibits the employment of crews in the ports. Their crews have nothing to do with the loading and unloading. That is done by home labor altogether.

Mr. A. L. HARRIS. Any further questions?

Mr. BRYANT. On behalf of the commission, permit me to thank you for your attendance and your very valuable information in regard to transportation on the Mississippi River.

(Testimony closed.)

WASHINGTON, D. C., February 8, 1901.

TESTIMONY OF MR. WILLIAM PENJE,

Secretary of the Lake Seamen's Union.

The commission met pursuant to recess at 2.04 p. m., Mr. Farquhar presiding. At 3.23 p. m. Mr. William Penje, of Chicago, Ill., secretary of the Lake Seamen's Union, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will give your name and home address and official position in the Seamen's Union.—A. William Penje; secretary of the Lake Seamen's Union; 123 North Desplaines street, Chicago, Ill.

Q. Yours is an organization confined to sailors on the lakes, is it?—A. Yes; and seamen on the lakes.

Q. How large a union is it?—A. It numbers about 3,000.

Q. What proportion of the seamen on the lakes are in your union?—A. There is more than a third, I should think. I think there are about 8,000 on the lakes, and we have about 3,000 in the organization.

Q. How many local unions are there?—A. There are at present in the winter time just four. During the summer we establish more.

Q. Where are those local unions?—A. All around the chain of lakes and going up the west shore of Lake Michigan—Racine, Milwaukee, Sheboygan, Manitowoc, Ashland, Duluth, Tonawanda, Erie, Ashtabula, and Toledo. The four winter unions are in Milwaukee, Buffalo, Cleveland, and Chicago.

Q. What becomes of the other unions in the winter time; do they go out of existence?—A. The offices are simply closed up and the men generally disappear. They go to other work through the winter. In those cases, as a general thing, the seamen look out for other employment and leave those ports during the winter, but they come back in the spring. There is no occasion really to keep those offices and places open.

Q. Do they keep cards in the union—working cards?—A. No; we have no working cards. We just have official receipts for dues paid.

Q. So that when they come back to those places again they come into the union without any difficulty?—A. Oh, yes; they pay their dues during the winter just the same. A good many of them pay them up in the fall of the year, and a number of them send their money by mail through the winter. Some pay up in the spring.

Q. Have you any benefit features connected with your union?—A. Yes; we have a death benefit and a shipwreck benefit.

Q. Will you describe those?—A. The death benefit is payable to a 6 months' member in good standing at the time of his death. The shipwreck benefit is paid to a member who has been shipwrecked, and is \$30. The death benefit is \$75.

Q. I forgot to ask you the amount of dues in the local?—A. They are 50 cents a month.

Q. (By Mr. FARQUHAR.) What is the initiation fee?—A. The initiation fee now is \$3.

Q. Are you connected with the American Federation of Labor?—A. Yes; we

are connected with the American Federation of Labor through the International Seamen's Union.

Q. The International Seamen's Union, is that an organization composed of lake seamen or does it take in ocean seamen?—A. It is composed of seamen on the Atlantic and the Pacific and on the lakes.

Q. Does your local union pay a per capita tax to that organization?—A. The Lake Seamen's Union pays a per capita tax.

Q. How much of a tax is that?—A. That is 3 cents per month per member.

Q. Out of the 50 cents dues?—A. Yes.

Q. Have you a strike fund?—A. No; we have just one general treasury for all purposes. Our association has only one treasury, and it is situated in Chicago, its headquarters. There is only one treasury for all purposes.

Q. (By Mr. KENNEDY.) Does your union fix scales of wages?—A. Yes.

Q. In conjunction with the employers?—A. We have up to the present not been recognized by the employers in general, although for years we had been recognized by the schooner owners, but not as an organization—as individual vessel owners. The Lake Carriers' Association, which is really the organization of the vessel owners on the lakes, has never recognized us.

Q. Then they fix the wages, and your union has no voice in naming the wages?—A. No.

Q. Has it any influence in—A. (Interrupting.) Oh, it has undoubtedly some influence.

Q. In fixing wages, I mean.—A. In fixing wages. If they fixed the wages too low, the men probably would not sail for them.

Q. Can you tell us something by way of comparison of the skill of the sailor on the lakes at the present time with 10 years ago?—A. The men are not nearly of the same skill that they were 10 years ago. The class of men that sailed 10 years ago have left the lakes and quit sailing for other different occupations, not being able to get married and support a family. They generally go into some other calling—such, for instance, as bridge building or architectural iron work, or become gripmen on street railroads. Others again have gone to farming; some do painting.

Q. Does this class of skill leave the lakes because these industries, like structural ironwork, are something of recent origin, or is it on account of harder conditions on the lakes?—A. Partly on account of harder conditions on the lakes, partly on account of the invasion of the steamboats, and partly because of wages going down.

Q. You have in mind then the men on the sailing vessels that you are speaking about?—A. Yes; they are the skilled men—the skilled seamen.

Q. What are the wages paid to skilled seamen on sailing vessels on the lakes to-day?—A. They started out at \$1.50 last spring and wound up with \$2.75. Those wages the Seamen's Union has control of, and the vessel owners have absolutely no say in that. The seamen hold their meetings and pass resolutions to raise the wages, dating back from a certain date, and those vessels that could not pay them, of course, would not get any men as a general thing. The men would keep in employment, and the wages would take effect all right as a general thing.

Q. Are you familiar with the rates of wages of 10 years ago?—A. Yes. The wages 10 years ago were somewhat better; say in the year 1890, the wages wound up at \$1.50 a day in the fall.

Q. What were they 4 years ago or 5 years ago?—A. Five years ago—in 1895—they wound up at \$2.50 or \$2 a day—about that.

Q. Better wages than those of to-day?—A. No; about the same.

Q. About the same?—A. At the close of navigation they were earning those wages, starting out in the spring with \$1.50. The wages at the close of navigation were \$2 and \$2.50.

Q. Do not good times and hard times have any influence in the pay of seamen on the lakes?—A. Oh, yes. For instance, a year ago last fall the wages in schooners on Lake Michigan were \$3 a day. There was practically half a dollar a day paid more for that season than this one, being a very good season for light vessels—schooners.

Q. Do you care to say anything about the nationality of the men employed on our sailing vessels on the lakes?—A. The majority of the men employed on the sailing vessels are Scandinavians.

Q. About what percentage of them are Scandinavians?—A. Of those employed on the schooners—about 60 per cent.

Q. What are the others?—A. They are divided up into other nationalities—some Americans, some Irish, some English, and some German.

Q. About what percentage were Americans?—A. I should say about 10 per cent.
 Q. Can you say why there was such a large percentage of Scandinavians and other foreigners and such a small percentage of Americans in the trade on the lakes?—A. That is due a great deal to the hardships. The Scandinavian race, as a general thing, take to the water. Most all Scandinavians are seamen and are used to the sea, more or less. Scandinavia is not an agricultural country, but a fishing and sailing country, and they are a hardy lot of people. The work on the sailing vessels being of the hardest kind, why they were most adapted to it, and stayed with it to a greater extent than other nationalities did.

Q. Had they come to America purposely to go into the seafaring business?—A. Yes. Many of them heard of the wages paid on our lakes in these good years and, of course, they would come over. The larger portion, of course, came over in the Scandinavian vessels to the United States and left them for some reason or other and drifted up to the lakes. The vessel owners always have agents down on salt water, and in that way induce a number to come up to the lakes.

Q. Do many of that nationality go into the United States Navy?—A. Yes; quite a number.

Q. Are the wages paid by the Government and the conditions in the Navy attractive to them?—A. Yes.

Q. How does the present number on the lakes compare with 10 years ago?—A. There were a good many more then according to the tonnage than there are now. The tonnage was different. There are a good many more seamen employed on the lakes now, but the difference of 10 years ago and to-day is principally in the skill of the men employed.

Q. (By Mr. FARQUHAR.) You mean the difference between the sail and the steam tonnage?—A. I mean that the tonnage on the lakes has increased considerably during the 10 years, but the manning of that tonnage has decreased. There is not an equal number of seamen employed now in any capacity on the lakes that there was ten years ago.

Q. (By Mr. KENNEDY.) That is on account of the steam vessels coming in?—A. Yes; that has shortened down the crews in every respect.

Q. Do you desire to speak about the manner of employment of the men in the sailing vessels on the lake?—A. Yes. In the old line schooners there was never any signing of articles. Captain and men met, and they would engage for the going wages for a certain trip, come back, get their pay, and leave the vessel. On the steamers of to-day the men are hired by the month, subject, of course, to discharge at any time.

Q. About how many months' employment in the year will the sailors have—seamen, as you call them?—A. Between 7 and 8 months.

Q. How much money can a seaman make during that time?—A. That depends on what capacity he would be in. There are different capacities. In manning a schooner he would make about \$300 for the season.

Q. You might speak of all the different capacities and the wages.—A. The wages on the lakes last summer were for wheelmen and watchmen \$45 per month. That was an increase of about \$10 over the previous year. The wages of the deck hand have increased from an average of \$15 to an average of about \$20 per month. The deck hand has really taken the place of the sailor, and the wheelmen and watchmen are really petty officers. Comparing the deck hand's condition with the sailor's of 10 years ago it has retrograded tremendously. A self-respecting person would not make a passage, or a self-respecting sailor would not under any consideration make a passage as a deck hand on one of these steamers of to-day. They are so abused, they are used so hard, and their wages are so low that it is only the worst class of people, that are hard up and stranded in seaports, that take those places. That is the man that is really taking the place of the sailor of 10 years ago. He is not skilled. He may be a shoemaker or a tailor, or any other sort of tradesman; so long as he is stranded in a seaport and nearly starved he is plenty good enough. They would take him aboard, work him all kinds of hours, and at an average rate of \$15 or \$20 a month by the season. Of course they never stay at it, they simply go and hire out to the boat, and when they find the conditions there—they are even too hard for them, and they generally get off at the next place. They strike, forfeiting their wages in most cases.

Q. (By Mr. KENNEDY.) Are any of the members of your union employed on these steam vessels?—A. Yes, quite a number; but the majority of them are wheelmen and watchmen.

Q. Any deck hands?—A. Deck hands, we usually do not take in. In some places the conditions of deck hands are better than this. For instance, on the line boats—the Western Line, the Erie Line, and the Anchor Line. As a general

thing in many instances they go to the poorhouse in Buffalo and get their crews, fill their crews of deck hands out of those places. If they can bring them back to Buffalo, in most cases they are so broken up by hard usage that they have to go back to the poorhouse. They make a trip a week, and at \$20 a month of course they could not have much money.

Q. Most of the members of your union are employed, I understand, on the sailing vessels?—A. No; the majority is employed on steamers, as wheelmen and watchmen.

Q. Are you endeavoring all the time to organize these deck hands?—A. No; we do not try very hard to organize these men, though at the same time we see it is the only way to better their condition and lift them up. There is no help from legislation; organization is the only thing that we can see that will better their condition and get a better class of men on those boats. If we could organize them thoroughly and get them reasonable hours of labor at first, and probably a little more wages, that would improve the personnel of them, and be the means of securing young fellows wanting to go to sea from the farm, for instance. If it was respectable they would follow the sea for a little time and get interested in a seafaring life and get advanced to watchmen and to wheelmen, for instance.

Q. Do you regulate the hours of working on the vessels?—A. Where we have had control we have regulated the hours of work.

Q. What is the number of hours?—A. Twelve hours.

Q. Twelve hours a day?—A. Yes; overtime for extra work at loading.

Q. How many hours a day do these seamen work who are not in the union?—A. That would be on the steamers, because all the men on the schooners are in the union, practically all.

Q. The unorganized deck hands, how many hours do they work? You say where you control they work 12 hours.—A. I mean the schooner when I say "controlled." We have organized the men on the steamboats, but it was only done last summer, and we have really not got control there yet. Those men work as much as 30 hours at a stretch; work 24 hours at all kinds of labor on the deck, and then take and steer 6 hours after that. There are many instances of that kind.

Q. Then how many hours rest?—A. No rest in this 30 hours. Then 6 hours' rest, and again 6 hours at the wheel. Take a boat going from Buffalo with coal, going into Milwaukee to unload. She gets in there in the morning, gets unloaded that day and leaves for Chicago, a run of about 5 or 6 hours. Then, when she gets to Chicago, they have, of course, to make ready for loading. All this time all hands are on deck, and there is no getting below until the boat is loaded and out on the lake. Then the man first at the wheel—say they loaded at 6 o'clock in the evening—would be on from 6 to 12. After being up 24 hours he takes the wheel and steers 6 hours consecutively.

Q. (By Mr. FARQUHAR.) Then, what is his rest after that; from 12 to 6 in the morning?—A. Yes.

Q. Then does he take the full time again?—A. No; he is out on the lake, and gets watch and watch—6 hours on and 6 hours off.

Q. (By Mr. KENNEDY.) He works 12 hours a day then?—A. Works 12 hours a day.

Q. (By Mr. LITCHMAN.) Is that what you meant by 12 hours a day on schooners?—A. Yes; that is 12 hours a day on schooners. Whilst loading in most of the lake ports, on the schooners they work the longshoreman's day, which in most cases is 10 and 11 hours. Then, of course, the sailor before he gets to work in the morning has to move the vessel and make the vessel fast, pump her out if she leaks any, and at the noon hour the same way; and after they quit at 6 o'clock and the longshoreman gets through, the sailor makes the vessel fast again and pumps her out.

Q. (By Mr. FARQUHAR.) Is he supposed to help in the discharge of cargo?—A. On these schooners he loads the vessel. He does all the shifting of cargo in many places.

Q. (By Mr. KENNEDY.) Do you desire to say anything about the necessity for regulations regarding the efficiency of crews and the manning of the vessels?—A. Yes; that is one of the main things I want to speak about. As I said, the deck hand has taken the place of the seaman of 10 years ago. His conditions are such that there are practically no seamen in that branch of the service. He is the poor fellow who gets out of work in some other line, and adopts it as a make-shift and never follows it long enough to make a seaman of him.

Q. I would like to understand what you mean by seaman? You mean a man who would be an efficient sailor on a sailing vessel?—A. No, not necessarily a sailing vessel. I mean an efficient seaman, a man who could do his work well, know enough to launch and row a boat, swing the vessel around, fire drill, etc.

Of course the standard of the Navy, which used to be taken to judge the skill of seamen, is getting pretty strong now; that is, for the present-day seaman. It was all right for the men on the lakes 10 years ago. Then about 90 per cent of the men sailing could pass that examination as to their skill; but at present, of course, there are not as many, that is, taking all the men, steamboat as well as sail, on the lakes to-day. I do not suppose there are over 2,000 men on the lakes that could pass that examination.

Q. (By Mr. KENNEDY.) Is it your desire that they should be able to surpass that standard or to come up to the standard set by the United States Navy?—A. No; it is our desire to get some legislation providing that a vessel of so many tons burden shall carry so many efficient seamen, and then give the seamen a certificate of efficiency, which every other country does at the present time.

Q. Gives a certificate from a government commission or official?—A. A government official in connection, say, with the custom-house. These customs-house officials are in very near every lake port, and it is done in other countries without very much inconvenience. It is very necessary that it be done on the lakes.

Q. How would a government official become possessed of the knowledge that a man was an efficient seaman and be able to give him such a certificate?—A. In the first place, in starting that sort of an office, he would have largely to take the word of the man or else give him an examination in seamanship before issuing the certificate. After that when a new man came into the office he could give him a certificate showing he commenced sailing such a date, and after a year or so of service raise him a notch. If he starts in as a landsman, a year or so of service, if he is any ways bright, makes him an ordinary seaman; another year or two makes him an able seaman. That is the way they are regulated in Germany and also in Great Britain.

Q. Would a certificate of membership in your union be sufficient certificate in regard to the man's efficiency?—A. From our point of view it certainly would, but I do not know what the vessel owner would say about that.

Q. Are all the members of your union what you call efficient seamen?—A. They are examined in seamanship and given a certificate of the capacity in which they can serve.

Q. Examined by whom?—A. By the officer in charge generally of the office where the man joins.

Q. Officer of the union?—A. Yes.

Q. Have you anything to say about overloading of vessels on the lakes?—A. It is a well-known fact among the sailors that it occurs very frequently, and no doubt disasters have taken place through that practice.

Q. You say "no doubt." Do you know whether that is the case or not?—A. Yes, I do know; in fact every sailor on the lakes knows it. While I could not mention any special case, I have a little clipping here on this subject (reading):

"Capt. Henry Leisk, master of the steamer *P. J. Ralph* has written a letter charging that there is reckless overloading in the iron-ore trade. The letter says:

"I want to sound a note of warning to vessel owners, cargo owners, and insurers that if the overloading of small vessels with iron ore continues as at present (and I must say here that in 9 cases out of 10 the master is not to blame), when the fall storms set in the record of disasters, accompanied by loss of life and property, will far exceed any previous year."

"Captain Leisk is explicit, and mentions the Mesaba and Northern docks at Duluth. He continues: 'A master of a vessel who asks for a car or two of ore, or a part of a packet, which is invariably necessary to put his vessel in trim, and consequently put her in a seaworthy condition, he is branded as a fool. He is generally given to understand that he must either take a full packet or go with what he has got. This means that he must either go to sea with his vessel out of trim, or else go 100 tons short of his load, or 100 tons more or less over and above what his vessel can safely carry. This has been my experience with the *Ralph* on two occasions when loading at the Mesaba and Northern docks at Duluth. June 23, when I found my vessel several inches deeper forward than I had intended she should be, I told the person in charge of the packet that I could take no more, but he insisted on my taking the remaining portion, and he threatened to run it on the deck of the vessel. I then ordered the lines cast off, and the vessel pushed off from the dock. Then you should have heard the tirade of abuse which was showered on my head.

"About an hour later they heavily loaded the schooner *Interlaken*. When her captain protested against being overloaded, he was told to throw it overboard when he got outside. Then, during the night, they dumped 120 tons into the forward hatch of the barge *Harold*, and left her 2 feet by the head, and with 146 tons of ore on board in excess of any previous load.

“About a week ago Mr. Treveranus boasted of his dock as breaking all former records of oreloading. Did he mention the conditions in which these vessels left the dock, and whether the masters were seaworthy or not?”

Q. Is not the complaint in regard to overloading principally as to the vessels in the ore trade?—A. Principally, because the cargo of ore is so much heavier than other cargoes. A good many vessels fill up with other cargoes and are not overloaded. This is the smaller class of vessels he speaks of not loading down to 18 feet, because those which can load to 18 feet or more could not load any deeper if they wanted to because of the depth of water in the river.

Q. Do they violate any law in overloading vessels?—A. There is no law at present in regard to overloading vessels.

Q. (By Mr. FARQUHAR.) Is there not a free-board law on the lakes, a United States law on free board?—A. Not that I am aware of.

Q. Don't the insurance companies insure under a free-board law of the United States?—A. The insurance companies do, but I do not think it is a United States law.

Q. (By Mr. KENNEDY.) Have you recommended any law upon this subject?—A. We have not recommended any on overloading. We have done no more than to protest sometimes. We have done that quite often. It is such a hard matter to get anyone to take up any legislation like that.

Q. (By Mr. FARQUHAR.) Can you get the cooperation of the insurance companies in a case of that kind?—A. The competition among insurance companies is so keen on the lakes they are glad enough to get the risk and say nothing.

Q. (By Mr. A. L. HARRIS.) Who owns these ore boats?—A. They are owned by different parties all along the lakes.

Q. They are not owned by any large companies, steel companies?—A. Yes; oh, yes; some of them are, but the boats which the large steel companies own are the large class of boats.

Q. (By Mr. KENNEDY.) Do they overload these boats?—A. No; they could not overload them because they can not load them down more than there is water in the rivers where they have to cross.

Q. It is the small boats then?—A. The smaller class of boats is where the overloading takes place—those drawing no more than 16 feet.

Q. They are undermanned, too?—A. Yes; they are undermanned. I have here several specific cases of different classes of boats, which show the manning of these vessels. Here is the barge *Australia*, belonging to the Corrigan Steamship Company, of Cleveland. She has 1 mate, 4 deck hands, 2 wheelmen, 1 engineer, 1 cook, 1 lifeboat. Now, on that boat there are only 3 seamen outside of the captain—that is, competent men. They paid these 4 deck hands \$25 per month last season, and the season before that they paid them \$20.

Q. How many seamen should there be?—A. There should be at least that many competent men. The crew as it stands now is 10 men. That is a very small crew of competent men.

Q. There are only 3 competent men?—A. Only 4 outside of the captain. This tow barge is 3,745 gross tons. She is one of the largest. It will carry about 6,000 tons of ore.

Q. I would like to ask what the crew of that barge could have done with that vessel if it had broken loose from its tow?—A. It would have depended on the 3 men to make the canvas on that boat, hoist the sail, and while doing that and getting anchors ready they would be in close quarters. It is practically impossible for 3 men to do that because in case of a break adrift, the 4 deck hands would be practically useless, even if they could do a little plain everyday work in fine weather. When a tow barge breaks adrift it is usually bad weather. These men then become useless because they are not seamen, and most men generally get seasick at their first experience in bad weather.

Q. Then that number is totally inadequate to man that vessel in an emergency of that kind?—A. It is absolutely.

Q. (By Mr. FARQUHAR.) How is it in fair weather?—A. They manage to get along by working the deck hands all hours and giving watch and watch out in the lake, but in the port they have to be on deck from the time they get in until they get out again.

Q. You would say that a boat with that number is shorthanded, anyway, fair weather or foul?—A. It is shorthanded, undoubtedly.

Q. (By Mr. KENNEDY.) Is it customary to stay 6 hours at wheel in any other part of the world?—A. Not customary in any place I know of.

Q. What is the custom elsewhere?—A. Two hours.

Q. Two on, and how many off?—A. Four off.

Q. The strain is very great on a man's nervous system—6 at the wheel?—A. It is simply impossible—it is beyond human endurance for a man to steer 6 hours at a stretch after working 24 or 30 hours continuously. It is an absolute impossibility. The strongest man could not stand it. In this vessel the committee tells me they loaded 24 hours. They got off easy. The tow barge *John Smeaton*, Bessemer Steamship Company, is manned somewhat different. She carries 2 mates, 3 sailors, 1 fireman, 1 engineer, 1 cook. There are 3 more competent men aboard this barge. She dispenses with the deck hand altogether. The deck hand on this class of barges is an innovation altogether. It is another new reduction.

Q. (By Mr. FARQUHAR.) Rather it is a displacement of an active seaman for a deck hand?—A. Yes. It shows what can be done in a few years. That boat was built in 1897, 3 years ago. These things are inaugurated and people do not know them as a general thing. It goes right on, with one reduction after another until we get down to the present.

Q. (By Mr. KENNEDY.) I would like to ask, before you proceed further, about this undermanning and overloading; is it an evil that exists principally in vessels owned by private individuals and not in vessels owned by large corporations?—A. Yes.

Q. Are they generally sufficiently manned and not overloaded?—A. Oh, no; they are not sufficiently manned, but on account of their being so large they can not load them down to their real capacity on account of the draft of water in the Detroit River.

Q. How does the manning on those vessels compare with the manning of the privately owned vessels?—A. The manning is bad in both cases—about the same.

Q. You can think of no difference in the manning then?—A. No. I can not see any difference, except that I know of a boat that was chartered by the Western Company—the New York Central and Hudson River Company, commonly known as the Western line. When she was with them they put 2 new men on, and when the charter ran out and she went back the 2 men were taken off. That would show that the boats running between Buffalo and Chicago are somewhat better manned than the general run of freight boats. This barge (*John Smeaton*) is 5,049 gross tonnage, one of the largest on the lakes. She carries 2 mates, 3 sailors, 1 fireman, 1 engineer, and 1 cook. They lose 30 hours when loading, and when at sea the crew get 6 hours on and 6 off. Now the manning of this boat is cut down so that it is ridiculous. Of course they depend on fine weather and they are well insured; also there are plenty more deck hands. The vessel owner really runs no risk.

I also call attention to the case of the steamer *Cadillac*, of the Cliffs Iron Company, of Cleveland. She is 1,263 tons register, carries 2 mates, 2 wheelmen, 2 watchmen, 1 deck hand on deck and 2 deck hands passing coal, 2 engineers, 1 oiler, 2 firemen, 2 cooks. The mate has to be forward keeping a lookout, as a general thing, though that is the watchman's place; but the watchman has no time for that as he has to be doing some work around the deck. So whenever the least thing out of the ordinary occurs all hands are called up on deck.

Q. Speaking of the barges, what, in your opinion, would be the result if one of them should break its tow in bad weather?—A. Not having men enough to make the sails, the tow would simply have to drift and go on the beach unless it drifted to some place where there was holding ground for the anchor; but there are so many places where there are rocks and where there is no chance to anchor that they would simply go on the beach and break up.

Q. Does it happen that the boats break their tow and are wrecked as a result of undermanning?—A. Yes; very frequently.

Q. Can you give an instance of that?—A. I do not know that I can remember any just now. The date and the name of the boat and everything like that I can not place just now.

Now, here is a smaller class of barge, the *Grace Holland*, 629 tons, length 189, beam 38, built 1880. It seems that the cutting down of crews has been mostly done in the newer vessels. Once a vessel gets established with a certain crew, it is not so easy to cut the crew down, as the men will not, as a general thing, stand for it; but as they bring out a new vessel that is the easiest time to get it chartered out on a good economic principle. The *Grace Holland* has 4 sailors. If these other vessels are manned right, this one must be overmanned. She must be very extravagant when she is only 629 tons, and one I told you about with over 5,000 tons is not so well manned. There were 3 seamen aboard that one, and this one has 7 seamen aboard her.

Here is the steamer *Coralia*, an iron steamer of 4,330 gross tons. She has 2 mates, 2 wheelmen, 2 watchmen, 2 deck hands on deck, and 4 coal passers. They paid these deck hands \$25 a month last year. Now the deck hands that pass coal get 6 hours on and 6 hours off, there being 4 coal passers. Two of them

work 6 hours, and then the other two take the watch; and in case one of the firemen gets overheated or overworked, one of these men has to take his place. They do not go on deck unless something extraordinary happens. There are 2 deck hands to work on deck. In some instances they are worked on the lake from daylight to dark; in other instances they get watch and watch. But when the vessel comes into port, and while in port, these deck hands assist on deck and work until the vessel goes out of port, unless there is some extraordinary delay. They would keep them on deck 2 days at a stretch.

Q. How many efficient seamen on that vessel?—A. On this one there would be 7, counting the captain.

Q. How many should there be?—A. There should be at least 14; and that is a conservative estimate.

The steamer *Republic* of the Republic Iron Works has 2 mates, 2 wheelmen, 2 watchmen, 1 deckhand on deck, and 3 deckhands on coal watch, passing coal. In this one there are 7 seamen. Two engineers, 1 oiler, 1 fireman, each holding the boat 3 hours on and 3 off. As a general thing they work 6 on and 6 off. The same is true as to the wheelmen and watchmen.

Q. Is that the custom on the ocean or in the coastwise trade?—A. The British commission on the manning of vessels, in their report to Parliament, state in their report that it is an utter physical impossibility for a man to steer a vessel as she ought to be steered longer than 2 hours at one time.

Q. Is there a law of Parliament prohibiting the employment of English sailors in that capacity for a longer period than 2 hours?—A. No; I do not think there is.

Q. But it is the custom in the merchant marine?—A. Just the custom. There is no law.

The steamer *Maricopa*, of the Minnesota Steamship Company, has 2 mates, 2 wheelmen, 2 watchmen, no deckhand on deck, 4 deckhands on coal watch. She has done away even with the 1 deckhand on deck. She has 7 seamen, and ought to have 14. While loading they were 24 hours on deck.

Tow barge *Carrington*, of the Pittsburg Steamship Company: Two mates, 2 wheelmen, 3 deckhands on deck and 1 deckhand who takes the fireman's place; 1 engineer and 1 cook. They were 24 hours on deck at a stretch on that vessel. Tonnage 3,180 gross. There are 7 competent seamen on her; should be 14.

Steamer *Presque Isle*: Two mates, 2 wheelmen, 2 watchmen, 1 deckhand on deck, and 4 deckhands passing coal. Tonnage 4,578 gross. When out on the lake they get 6 hours on and 6 off. Competent men aboard 7; there should be 14.

Steamer *Onoko*, P. J. Minck Company, iron steamer: Two mates, 2 wheelmen, 2 watchmen, 1 deckhand on deck, and 2 coalpassers. Tonnage 2,164 gross. They work 24 hours at a stretch on that vessel. Seven competent men; should be 14.

Steamer *Massachusetts*, J. C. Gilchrist Transit Company: Two mates, 2 wheelmen, 2 watchmen, 2 deckhands on coal watch with no deckhand on deck. Tonnage 1,415. Seven competent men; should have 14.

Q. Where did you get this data, Mr. Penje?—A. I got this from the men in the different places all around the lakes.

Q. From the officers of your union?—A. Members of the organization, in conjunction with officers.

Q. Some of them aboard these vessels?—A. Yes; some of them sailing right in the vessels. The 3 men that got this testimony are in Cleveland, in the habit of sailing in these vessels, and know the conditions thoroughly. The statement is signed by the 3 men.

Now, I want to call the Commission's attention to one of the modern tow barges, the *Australia* of the Corrigan fleet. She carries 1 mate, 1 cook, 2 wheelmen, 3 deckhands. There are only 4 competent men aboard that vessel—competent seamen. That is 3 less than a barge of a little over 600 tonnage should have, and she is 3,467 tonnage. This is a modern tow barge, one of the latest out.

Here is the steamer *Northwest*, one of the fancy passenger steamers—one of the finest on the Lakes. The *Northwest* and *Northland* run between Buffalo and Superior for 3 or 4 months in the summer season, carrying passengers. This boat is allowed to carry 300 or 400 passengers—400 or less. She has 3 mates, 1 captain, 12 seamen—what they call seamen. Last year they paid \$35 a month, and the year before they paid \$25. That is \$5 more than the deckhands get. They are not competent men. They are called seamen, and they put a uniform on them so that a passenger does not know the difference. They look like seamen with the blue uniform, but on account of the low wages and the failure to discriminate at all, one-half of them are not seamen and could not save themselves, let alone saving a passenger in time of distress. That is a well-known fact. She carries 12 of these men. There are also 1 boatswain, 1 boatswain's mate, 1 carpenter, 4 quartermasters, and 3 lookout men. All told, there are 26 supposed-to-be seamen aboard of her. That number is too small for vessels of that class if they

were all competent men, but half of the so-called seamen not being seamen at all, the force is entirely inadequate.

Q. You spoke a while ago of the disasters on the lakes being attributable to overloading and undermanning. Have you any data in regard to the wrecks or disasters on the lakes for any recent period—a period of a year or so?—A. I believe there were 110 last year.

Q. Have you any compilation of facts as to the causes of these wrecks?—A. The causes are so very hard to obtain, because as a rule they are insurance cases, and the men are either controlled by the vessel owners or the insurance companies, and there can be nothing got out of them as to the real facts. It is only in very extraordinary cases where the evidence really gets to the public. If it is a case of lawsuit they may get at it; but it drags along for years, until the case gets out of the mind of the public.

Q. I suppose a majority of them were disasters that would occur, perhaps, no matter how efficiently a vessel were manned.—A. No; I think the majority of the disasters last year were collisions in the Detroit River.

Q. Caused by bad steering?—A. By steering in some instances, no doubt; and also by going too fast, notwithstanding there are rules regulating the speed, and by wheel chains breaking, steering gear getting disabled, etc. But with a sufficient crew aboard most accidents could be avoided. A steamer in the Detroit River should have 2 men standing at the hand steering gear all the time, so as to be ready in case the steam gearing gave out to steer the vessel properly; but on account of the smallness of the crew it is impossible to spare 2 men for that purpose, because they have only 1 steersman on deck and he is steering with the steam steering gear. I think some vessels have a provision to shift quickly from the steam to the hand steering gear, but it takes too long, and the river being so narrow—only 80 feet wide in some places—and with vessels passing each other all the time, it can not be avoided unless there are 2 men standing at the hand steering gear all the time; but, of course, they have not crew enough for that.

There were running out of Chicago during the winter 2 lines of passenger steamers, the Goodrich Line and the Berry Line. On the Berry Line on the *City of Vermont* they pay their wheelmen in the winter time \$30 per month; their watchmen they pay \$10 per month. They carry passengers all winter. They carry 2 mates, 2 wheelmen, 2 watchmen, and they pay the wheelmen \$20 and the watchmen \$10 a month. Of course it is winter time, but the idea of getting competent men for that wage, men that can be relied on, is wholly out of the question. In the summer time the boats carry 2 wheelmen and 2 watchmen, and the wheelmen get \$30 and the watchmen \$25. They carry 2 lookout men, at \$25, and 5 so-called sailors, at \$30 per month.

Q. (By Mr. LITCHMAN.) Do I understand you to say most of these men are single men?—A. They have of necessity to be single, because they do not get wages enough to keep a wife and family on. If they sailed all the year round there might be a possibility for them to make both ends meet, but the season is only 7 or 8 months long and they could not keep a wife and family.

Q. Do you know whether among them there are any who can save anything out of those meager wages?—A. Yes; there are men who save money out of those wages even, by being economical, of course, and trying to get something else to do immediately in vacation seasons.

Q. (By Mr. KENNEDY.) Have you been a sailor on the ocean?—A. Yes.

Q. Are you familiar with the conditions with regard to wages and hours and other discipline on the ocean as well as on the lakes?—A. Yes. I commenced to sail, when I was 15 years old, in the small German vessels, and sailed there until I got to be an ordinary seaman, when, through my apprenticeship, I shipped in an English vessel. I made one voyage around Cape Horn to the West Coast and back, and got an able seaman's discharge and got promoted. I had sailed then 3 years altogether.

Q. I want to ask you what is the condition with respect to wages, discipline, hours, etc., of the American seamen on the lakes and on the ocean?—A. The conditions in the coastwise trade on the Atlantic coast I presume you want. The men generally get watch and watch, and there are none but competent men in that trade. In the vessels in which I was employed I never saw them try to ship incompetent men. They would not have them in those vessels. If an incompetent man happened to ship, they would find it out and he would have to leave immediately.

Q. What about wages?—A. The wages were generally what the shipping master made them. The seamen were not organized when I was sailing there, and of course had no voice in the matter.

Q. How did their wages compare with the wages on the lakes at that time?—A. The poorest wages on the coast at that time were \$20 a month.

Q. What were they on the lakes?—A. Of course, at that time they were a great deal better.

Q. Do you know the wages in the coastwise trade at the present time?—A. On the Pacific coast, \$45; on the Atlantic, from \$25 to \$35 a month.

Q. What is the highest on the lakes?—A. For sailors, that is the deck hand, the highest is \$35 a month on the passenger boats.

Q. As against \$45 on the Pacific?—A. Yes.

Q. What is your opinion as to the relative condition of the seamen in the coastwise trade and those on the lakes at the present time?—A. The condition of the seamen in the coastwise trade is far better.

Q. Why is that so?—A. Because they are not worked so many hours, as I have told you in my testimony, 30 hours at a stretch. They do not ask a man to do that on the coast. The men would probably not do it if they were asked. They are seamen and these are not.

Q. (By Mr. LITCHMAN.) On the coast the loading is done by longshoremen?—A. Principally.

Q. And the seamen simply sail the vessel and do not take any part in the loading and unloading?—A. As a rule, they do not. There are exceptional cases where they assist; I have done it.

Q. (By Mr. A. L. HARRIS.) How are sailors provided as to rations?—A. Very poorly. On these line boats, 7 cents a meal is allowed. That is, for all hands aboard the boat. They make a contract with a supply agent, not a grocer or butcher, but a sort of middle man between the grocer and butcher and other stores, and he supplies the vessels at 7 cents a meal. He puts just enough aboard a vessel to make the week's trip. They know the schedule—how long it takes the vessel to make the trip. But if a vessel happens to run up against bad weather and is two days overdue, everybody goes hungry. The wheelmen and watchmen, who are petty officers, are treated somewhat better than the deck hands; but of course, paying 7 cents a meal, they can not expect the very best fare.

Q. What does the fare consist of?—A. General every-day fare—nothing especial; just every-day grub—meat, potatoes, vegetables, and coffee or tea.

Q. Do they sit down to the table or does each one go and get what he wants?—A. In regard to the deck hands, the food is put in a bowl and handed to them, and the first come is the first served, as a general thing.

Q. That is, for the lakes?—A. Yes.

Q. How is it for the coastwise trade—any better?—A. The coastwise trade in that respect is every bit as good as the lakes. The crews, of course, eat in the forecabin. The food in a good many instances is not any too good, but there is a law now that provides for so much food for the men.

Q. Is that law complied with?—A. No; it is not generally complied with. It is not generally enforced. It is a new law, and, of course, having the law on the statute books does not put it in operation, as a general thing, and the men being somewhat kept down anyway, they very often fail to assert their rights. If they do assert them, they are regarded as kickers, and so, as a general thing, the sailor in that respect gets the worst of it.

Q. The law is easily evaded?—A. Yes.

Q. How many meals are served?—A. Three meals a day.

Q. (By Mr. KENNEDY.) You said something about the accommodations or the facilities for the deck hands, officers, firemen, etc.?—A. The accommodations for the deck hands are of the very poorest, and, of course, as they are not self-asserting, it naturally follows that the surroundings are bad. Those pick-ups that they get, they are not clean themselves, and it would be impossible to keep the place clean. Indeed, there is no effort to keep the place clean; in fact, if they were to keep clean, they would not have time for passing coal 6 hours and then get 6 hours off; a man does not feel like scrubbing up very much after such service. Their quarters are of the worst kind; their condition is horrible from all view points.

Q. Is the law complied with in regard to space which shall be allowed to each sailor?—A. As a general thing it is on new vessels. On some of the older vessels they have not the required space, and there is no complaint made about it, but in the newer class of vessels they have space enough. Modern vessels have very nice rooms for quartermasters, watchmen, and officers—splendid, some of them; but deck hands' quarters and the firemen's quarters, too, are away down in the fore part of the vessels and are anything but what can be desired.

Q. Are the deck hands and other men aboard vessels generally well informed as to what they are entitled to under the law in regard to space, etc.?—A. Yes; they are generally well informed as to that.

Q. (By A. L. HARRIS.) You say the accommodations are poor. What does the boat provide in the way of bed clothing to keep the sailor comfortable?—A. It furnishes mattresses and cotton or calico quilts, but on account of the crowds

they carry in those large steamers, the deck hands' places get so they are not fit for a human being to stay in. The competition, they claim, is responsible for that, when the fact is that the sailors' wages aboard of those large carriers is one of the very smallest items there is in the expense.

Q. (By Mr. KENNEDY.) Who provides the bedding in the coastwise trade?—A. The sailor provides it himself.

Q. In that respect, then, the sailors on the Lakes have an advantage over those in the coastwise trade?—A. They have an advantage; yes.

Q. By Mr. FARQUHAR.) Are the quarters of the deck hands on the Lakes infested with vermin?—A. They are, as a general thing.

Q. How is it with the coastwise trade?—A. They are clean.

Q. You have no boat inspection in the coastwise trade in respect to cleanliness?—A. No; merely a different class of men. As a general thing, a thorough seaman keeps himself clean anyway. Yes; there is not a deck hands' quarter on any boat on the chain of lakes that is not full of vermin.

Q. Has the dismantling of the regular schooners on the Lakes into barges caused a deterioration of the character of seamen?—A. No, it has not; not that. There are lots of those barges that still seem to carry 4 competent seamen, as they always did.

Q. Nominally they did?—A. Well, they did practically, too.

Q. (By Mr. CLARKE.) Are not all the vessels on the Great Lakes square rigged?—A. There are a few, a very few left. Now they are square rigged on the foremast, that is all.

Q. Are there any five or six masted schooners on the Lakes?—A. No; only three-masted schooners.

Q. That is the largest?—A. Yes. They had a four-masted schooner, but she is a barge now.

Q. Are there any power arrangements for hoisting sail?—A. Yes; the majority of the larger class of vessels carry what is known as the "donkey," a small engine for hoisting anchor, sail, and flush-down pump.

Q. Are there any electric or other helps in steering by power?—A. Yes. There is the modern barge that has steam-steering gear, and some of them have an electric motor, too, and furnish their own electric light, but the number is small.

Q. When power is furnished for hoisting sail and for steering, and also for hoisting cargo, is it necessary to have so many deck hands as it was before power was supplied?—A. There might be a little reduction made for steam power in the shape of a "donkey" aboard a vessel, shipped on some of the very modern vessels, but I have been in vessels where they have had steam "donkeys," and just about the time it came freezing weather something happened to the "donkey," and if there had not been a sufficient crew aboard then it would have been just as bad, although on the modern vessels they have other arrangements, so that now it is more perfect, in that they keep steam on the "donkey" in good shape, and I think some little allowance might be made as regards the number of the crew; but when there is a barge, a boat of 3,000 tons register, and with only 4 competent seamen—I believe there is one of 3,000 tons—that is too small a crew altogether.

Q. As to the sleeping accommodations—are separate rooms furnished for the sailors and the deck hands?—A. The deck hand is the sailor. The deck hand does not sleep with the petty officer and watchmen and wheelmen. The watchmen and wheelmen have a room by themselves.

Q. How many usually occupy a room?—A. In most cases the wheelmen have a room by themselves, and the watchmen and the deck hands have one room by themselves.

Q. That is, how many will be in that room, as a rule?—A. There could not be very many; on most of those vessels there would be one there at a time.

Q. Is there any reason why those rooms can not be kept in a sanitary and comfortable condition and free from vermin?—A. It is not possible with the grade of men they carry, with the wages they pay, and the usage they give the men. A self-respecting man they could not keep there; he would not stay. One thing they have to do is to keep those men, and if the boat is clean one trip it would be in bad condition the very next passage.

Q. If those rooms and beds were kept clean would the boats be able to attract a better class of men?—A. Not by keeping them clean alone; they would have to give them reasonable hours; then the keeping of the rooms clean might have some effect—in fact I know it would have an effect.

Q. Don't the masters of those vessels inspect the quarters of the sailors or deck hands?—A. Yes; but then the master knows it is a hopeless case, just as I am stating. He knows also how long the deck hand has worked, and he knows how long he has stayed on the vessel, and he knows in most cases it is just one passage; and he knows if he cleans it up that passage the next fellow he gets will only leave

it in as bad shape again. So, of course, they do as well as could be expected. It is not the master's fault that he has got so short a crew.

Q. Then, it is your opinion that an improvement in the quarters will depend largely upon the employment of a better class of men?—A. Yes.

Q. That will depend upon better wages and hours?—A. Reasonable hours.

Q. Do the complaints which you have made in regard to badness of quarters and food, lowness of wages, and undermanning apply to the vessels owned by the steel companies and other large corporations doing their own transportation, or are they chiefly made against common carriers?—A. They are made against every steamer on the lakes.

Q. (By Mr. A. L. HARRIS.) Is that condition improving or getting worse?—A. There is no chance for it to improve.

Q. Not much chance to get worse?—A. Well, I do not know.

Q. (By Mr. KENNEDY.) Don't they improve when they go into structural iron-work and bargework?—A. The man who is sailing now doesn't go there. He is not the kind of man that will do for that work. You see structural ironwork takes a calculating, nervy, cool-headed sort of a man like the old-time sailor used to be.

Q. A large proportion engaged in that work are men who have followed the sea, are they not?—A. Seventy-five per cent of them I believe; very nearly that.

Q. And the grip men on the cars?—A. Quite a number of those are sailors, some police officers. They enter into all trades, but principally that of building bridges and doing structural ironwork.

Q. It is the man who went to sea in the sailing vessels particularly who becomes qualified for that sort of work, is it not?—A. Yes; the life of a sailor aboard sailing vessels trains a man to all practical work, gives him a steady nerve. If he can't acquire that he won't become a good seaman even, and a man staying any length of time gets well qualified to do work of that kind—work where a man has to think and work at the same time, and who changes from one condition to another quickly.

Q. (By Mr. FARQUHAR.) Under a continuance of like conditions that you have now, will it be necessary to recruit the seamen of the Lakes from immigrants?—A. No.

Q. With all the foreigners engaged on the Lakes there now, how are you going to, under the present conditions, ever give employment to Americans in your service?—A. I do not say there are so many foreigners employed now; it was 10 years ago I spoke of.

Q. What is the proportion of foreigners now?—A. It is two-thirds.

Q. Under the present conditions and with a continuance of the present conditions will you not be forced to recruit and bring the new men from immigrants; would not you be forced to go into the lowest class of foreign immigration to get your recruits on the Lakes?—A. I presume so; but if the conditions are changed, and I think they will be changed, for I can not think that we can continue the way we are, the young Americans will only be too glad and willing to go to sea and remain there, providing the conditions are so he can support a wife and family and have reasonable treatment.

Q. (By Mr. KENNEDY.) You did say that 60 per cent of those employed on the lakes were Swedes and Scandinavians, I believe. Now, you say you meant that statement for 10 years ago. Can you say what proportion of Scandinavians or Swedes are at work on the lakes now?—A. Well, I can not say the exact percentage, but the Canadians are in the majority now. Then comes the Scandinavians, then the Americans. Now, the percentage would be, I presume, about 35 per cent.

Q. (By Mr. CLARKE.) When you say Canadian does that ordinarily mean French Canadian?—A. No; I mean men born in Canada of Scotch, or English, or any other parentage.

Q. (By Mr. KENNEDY.) Are Scandinavians coming in all the while to work on the lakes?—A. They do not come any more, hardly.

Q. (By Mr. FARQUHAR.) They rather go to farming, don't they?—A. Yes; they would go at almost anything else now.

Q. (By Mr. A. L. HARRIS.) What is the wage of the American seaman compared with the German seaman?—A. Taking the deck hand, that is the seaman, the German seaman's wages are better; his wages are better. They buy four or five times as much, and his treatment can not be compared with that of these men.

Q. (By Mr. FARQUHAR.) You speak of the lake now?—A. Yes.

Q. (By Mr. A. L. HARRIS.) My question referred to the ocean.—A. Take it right through, I do not think there is very much difference.

Q. (By Mr. LITCHMAN.) Which would you rather be, an able seaman on a German vessel or a deck hand on the lakes?—A. A German sailor.

Q. (By Mr. A. L. HARRIS.) While you were learning your trade were you on the ocean at any time?—A. Yes; all the time.

Q. Was that while you were in the German service?—A. In the German and English service, both.

Q. What are the conditions in pay compared with the German service and the English service?—A. There is little difference between the German and English service, but it is made up in the buying power of the money of Germany and England.

Q. Which gets the largest wages?—A. The English sailor; that is, the man sailing out of England, but if both of them sail out of some other foreign port the wages would be equal. In the case of an Englishman sailing out of a German port along with a German, the two would get the same wages.

Q. (By Mr. LITCHMAN.) State what the wages are, if you please, or were at that time.—A. At the time I shipped out of Hamburg it was £2 10s. a month as an ordinary seaman.

Q. (By Mr. A. L. HARRIS.) Reducing that to American money, how much is it?—A. That is \$12.50.

Q. (By Mr. LITCHMAN.) At that time can you give the ordinary wages on the English vessel?—A. I got the same wages. It was in the winter time, and there was not much difference at that time. We went to England, and to New South Wales, and I went out on the same vessel again for the same wages. Our wages in England and Germany at that time were equal. As a general thing there is a difference of 5s. or \$1.

Q. What year was that, may I ask?—A. This was in 1881.

Q. Nineteen years ago?—A. Yes.

Q. Have you any knowledge whether there has been any raise in the rate of wages from that time to the present?—A. There is a little raise from that in England now, if I understand.

Q. About £3 now in England at the present time?—A. No; an able seaman's wages at that time was £3.

Q. You were speaking of the ordinary seaman at that time?—A. Yes.

Q. You said £2 10s.?—A. Yes.

Q. You said there was about 5s. addition; it was £3 then?—A. Yes; about £3 now for an ordinary seaman out of England.

Q. That is about \$15 as against \$25 in the coast trade here in America, is it?—A. Yes; that is for ordinary seamen.

Q. (By Mr. A. L. HARRIS.) How do the wages of the American coastwise trade compare with the wages of the English seaman?—A. Well, of course, they are better.

Q. (By Mr. LITCHMAN.) Please state the conditions between wages paid in deep-water traffic in the coastwise traffic in Europe and the same in America.—A. At present I believe the wages in England are £4.

Q. For ordinary able seaman?—A. Able seaman; that is \$20. Now, wages on the coast here are \$25, an addition of about \$5. In the foreign trade the American wages—that is to say, out of New York, of course—it holds good just the same with the English vessel and the American vessel lying alongside of each other. Both pay the same wages, pay the wages of New York; but a vessel going on a foreign voyage from England and a vessel going on a foreign voyage from New York, there you would draw a comparison. But I am really not posted just now as to wages paid in deep water on the Atlantic coast here, but I presume it is about \$18.

Q. Is it not the custom for a vessel in foreign trades to engage a crew in Europe for the round trip, and thereby fix its rate of wages from the foreign rate of wages and not from the New York rate of wages?—A. That is correct.

Q. Then the inference would be in that case that the wages would really be a little lower than if paid at the rate of New York wages?—A. Yes; a little lower—a little difference.

Q. As to rules and regulations covering the conduct of vessels in foreign trade, they are about the same with foreign vessels and American vessels? I refer especially to the space given to each man, and the food and the general conduct of the vessel.—A. The foreign rules in that respect, I believe, compare favorably with the laws in the United States as to food. There are countries which provide for men somewhat better than the United States do. I know the laws of Denmark, Germany, and Holland are better in regard to food than are the United States laws. But I am not very well informed on that point.

Q. (By Mr. A. L. HARRIS.) Better than the law of 1898?—A. Yes; I think so. I think an improvement on that even.

Q. (By Mr. LITCHMAN.) How long is it since you had experience on the ocean?—A. About 12 or 13 years.

(Testimony closed.)

WASHINGTON, D. C., February 16, 1901.

TESTIMONY OF DANIEL H. HAYNE,

General Solicitor of the Merchants and Miners' Transportation Company.

The commission met at 11 a. m., Mr. Phillips, presiding. At that time Mr. Daniel H. Hayne was introduced as a witness, and, being first duly sworn, he testified as follows:

Q. (By Mr. C. J. HARRIS.) Will you give us your full name and your post-office address?—A. Daniel H. Hayne, 214 East German street, Baltimore, Md.

Q. You may also give us your occupation.—A. My occupation is General Solicitor of the Merchants and Miners' Transportation Company.

Q. How long have you been connected with transportation by water?—A. Since 1891.

Q. Have you examined our topical plan of inquiry?—A. I have.

Q. Have you some general statement that you would like to make before you are examined specifically?—A. Yes. I suppose I should start with a statement concerning the line that I represent. The Merchants and Miners' Transportation Company was incorporated by the General Assembly of Maryland on April 24, 1852. The early history of the line was one of some discouragement, but on December 28, 1854, the first trip was made from Boston to Baltimore. Later on, in 1867, the company commenced to run steamers from Boston to Norfolk and thence to Baltimore, returning from Baltimore, via Norfolk, to Boston. In January, 1859, the line from Providence to Baltimore was started, but only ran a short time. In 1873 the Providence Line was again established, this time to ply between Providence, Norfolk, and Baltimore. The Baltimore-Savannah Line was purchased by the Merchants and Miners' Transportation Company in January, 1876, and the Philadelphia-Savannah Line was inaugurated by the company in October, 1900. You will thus see there are 4 lines operated by the company known as the Baltimore and Boston Line, the Baltimore and Providence Line, the Baltimore and Savannah Line, and the Philadelphia and Savannah Line. The first has 4 sailings weekly, the second has 3 sailings weekly, the third has 3 sailings weekly, and the fourth, a sailing every 5 days. In order to maintain this schedule, there are 15 steamers. They have a net tonnage of 23,868 tons and a gross tonnage of 33,533 tons. These steamers ply between Boston, Providence, Norfolk, Baltimore, Philadelphia, Newport News, and Savannah, as terminals.

Now, as to the classes, manner, and terms of employment, I would state that, generally speaking, all men on shipboard are considered seamen. There is a subdivision into officers and crew; or probably the classification that would be most helpful to you would be that of masters, mates, quartermasters, boatswains, seamen, engineers, oilers, water tenders, firemen, coal passers, stewards, stewardesses, cooks, messmen, pantrymen, and waiters.

Q. (By Mr. C. J. HARRIS.) How many men do you employ in those lines?—A. On shipboard there would be about 552 for the 15 ships now running. As to the manner of employment, the coastwise trade and the conditions surrounding coastwise seamen are so favorable that there is no necessity of our employing agents to secure help. It is entirely a matter of individual agreement between the applicants and the officer employing the help. The terms of employment are controlled by what are known as "shipping articles," prescribed by law, in which the contract of employment is clearly expressed. I have a copy of the shipping articles and can present it to the commission if you choose to see it.

Q. In a general way this shipping article is a contract between your company and the man employed?—A. With every man on shipboard. It is prescribed by law and is in writing. The contract is read over to the men when they sign, and copies of it are posted in conspicuous places on shipboard in order that they may become familiar with it.

Q. Do you say sailors prefer shipping on your boats to the general line of coastwise trade—that is, on sailing vessels?—A. No, I did not make the statement so broad as that they preferred our vessels; but from the fact that there are continued applications for employment on the coastwise vessels, and from the further fact that the sailing vessels and tramp steamers find it necessary to have agents to secure their help, it would seem that the conditions of coastwise liners must certainly be more favorable.

As regards the treatment and provision for comfort and health on shipboard, the sailors or seamen of the Merchants and Miners' Transportation Company are treated precisely like other employees. Under the broad-minded and liberal policy of the president of the company, Mr. Michael Jenkins, there is a personal solicitude on the part of the company for the welfare of all of its men.

Q. You have no control of or arrangements for the men when they are on shore, I suppose, but only when they are on the vessels?—A. May I ask further enlightenment as to that question? In what way? What sort of control?

Q. Well, for instance, do you employ these men by the month or the year?—A. By the month; but I might digress here and perhaps answer your question fully by stating that the shipping articles provide that they are engaged for the voyage on which the vessel leaves at the time of their first signing. They are engaged by the month and paid by the month. They have the right under our shipping articles to leave at any port. The company early realized that in order to get the very best service out of its men they should be treated as men. We rather anticipated the laws in that respect, and our shipping articles have always provided that the sailor may leave at the next port at which the steamer touches—providing he leaves immediately after the ship is docked. If he continues in the employment after arriving and until the ship is about to leave, we would have great difficulty in securing a new crew, and in such event the contract provides that he "has shipped" for the next voyage. That provision was made in order to protect the company and to protect the seamen. The seamen have a right to leave and the company has the right of dismissal at the ports.

Q. Would not that provision be liable to cause you serious trouble? Suppose half your crew should leave you at Savannah, how would you get enough trained men to take their places to get back with?—A. If such conditions existed, they would cause great embarrassment, but we find the crews do not want to leave the ships on which they are employed. We have never had an instance such as you suggest. If we had such an occurrence, we might endeavor to have some change made in the law to provide against it, but at the present time the law provides for that feature, and we see no reason why it should not exist.

Q. Do you have any complaint or suggestions to make in regard to the navigation laws of the United States?—A. Generally speaking, I believe they are in advance of the navigation laws of some of the other countries. There are, of course, in the nature of things some little difficulties that are experienced, but they are not of great moment. I might mention, for instance, that the coastwise companies are obliged to put in their shipping articles a scale of provisions, under the ruling of the Treasury Department based on the opinion of the Attorney-General of the United States, and it is a question among the lines whether they are obliged to give identically that fare, or whether they should give the fare they formerly gave; because you realize that in running a large passenger line there are large supplies put on board that are not consumed by the passengers and which can be served to the sailors. Thus the sailors' fare is very much better than the fare prescribed by law, which law, as I understand it, was directed toward foreign vessels and individual captains; but these are not conditions that are causing any friction whatever.

I might say further, speaking from the owner's standpoint, that I have never found any law that would give the United States courts jurisdiction over larceny committed within the boundaries of a State. There is a law touching embezzlement and damage of freight and cargo, but the law affecting larceny only seems to apply to the high seas and to territory over which the United States has exclusive jurisdiction. In other words, the larceny law has not been made applicable to all navigable waters. The owners experience great difficulty in prosecuting larceny on shipboard, for the reason that the various State laws conflict, and it is very difficult to locate precisely the situs of the crime. With that condition confronting them they are unable to feel perfectly safe in applying to any State court, because they are often unable to positively prove exactly where the crime was committed, and if the proof should show that it was committed out of the State, there would be a failure of jurisdiction and probably a suit for unlawful imprisonment, with other attending difficulties. The only remedy that we have found has been to invoke a law which states that it shall be a misdemeanor to embezzle from or to damage ship, cargo, and stores. We think that probably this law might be elastic enough to cover the offense of larceny, but it is a matter of some doubt. Certainly larceny is not embezzlement, but there would be loss and damage to the cargo in the act of larceny. We feel that such an addition to the laws as might specifically prevent larceny, so as to give United States courts and State courts concurrent jurisdiction when the act is committed within a State, would add greatly to the moral tone of the lines, and would be directly of great benefit to the employees and to the shipping community.

The acts now relating to this point are as follows:

R. S. 4596: Whenever any seaman who has been lawfully engaged, or any apprentice to the sea service, commits any of the following offenses, he shall be punishable as follows:

* * * * *

Eighth. For willfully damaging the vessel, or embezzling, or willfully damaging any of the stores or cargo, by forfeiture out of his wages of a sum equal in amount to the loss thereby sustained, and, also, at the discretion of the court, by imprisonment for not more than twelve months.

R. S. 5356: Every person who, upon the high seas, or in any place, under the exclusive jurisdiction of the United States, takes and carries away, with intent to steal or purloin, the personal goods of another, shall be punished by a fine of not more than \$1,000, or by imprisonment not more than one year, or by both such fine and imprisonment.

Now, as to discipline, that operates on shipboard precisely as it exists on land. The discipline starts usually with a mild but positive admonition to the offender. If there is a recurrence of the offense, the policy of the company is to follow it up by a suspension; and further offense by dismissal. The redress of grievances is found in a system of notices to the superior officer in command, and if the grievance is not adjusted satisfactorily to both sides, the shipping articles provide a method whereby there can be an appeal to the higher authorities in this way [reading from shipping articles]: "Upon the commission of any of the offenses enumerated in the articles, or of any breach thereof, if it should be contemplated to raise an issue, an entry thereof should be made in the log book, and should be signed by the master and by the mate, or by one of the crew; and the offender, if still in the vessel, should, before her next arrival at any port, or if she is at the time in port, before her departure therefrom, either be furnished with a copy of such entry or have the same read over distinctly and audibly to him, and he may thereupon make such reply thereto as he thinks fit; and a statement that a copy of the entry has been so furnished, or that the same has been so read over, together with the reply, if any, made by the offender, should likewise be entered and signed in the same manner." So in that way a record may be secured.

While I am on this question of the contract, I might say that a further notice is given to masters that "while without any cause notice to either party terminates the service of any signer at the expiration of any voyage as prescribed in the articles, it is presumed that this provision will not be enforced to the hurt or disadvantage of any employee without good and sufficient cause, but that reasonable opportunity will be afforded for return to the port of embarkation."

Q. With reference to hospitals, I want to know whether when the sailors are on shore they are subject to these perils here in these hospitals and sailors' boarding houses?—A. They are undoubtedly subject to perils if they choose to leave the ship. They have the right to leave the ship at any time under our contract, providing they leave the ship when the ship first enters.

Q. What I meant was whether, when the sailors are still in your employment, but in these various ports, you had much trouble.—A. We never experience any trouble; and in fact while sailors come and go—they are a shifting class to an extent—there is a stability in the personnel on the ships.

Q. What about your stevedores; are they continuously employed, or do they load the cargoes of the vessels and unload them by the contract?—A. They are paid by the hour. There are in the neighborhood of 1,300 stevedores employed at the various ports. I have the amounts paid them.

Q. I wanted to know in a general way what plan you had, whether you had these men employed directly by yourselves, or whether you employed a general stevedore force?—A. We have our own men. They apply to us individually for employment, and while they have the right to leave at any time, being employed by the hour, there is a stability in the personnel that you might say is constant.

Q. Of course, your vessels running regularly, you would have your regular force instead of employing the general stevedore forces which load and unload the tramp steamers?—A. Oh, yes; we have, as I understand it, nothing like that.

Q. Have you had any strikes on the part of your stevedores?—A. Not to my knowledge, neither of stevedores, nor of any other class of employees.

Q. About what wages do you pay the stevedores?—A. They are paid by the hour, and the prices fluctuate at the various ports. Broadly speaking, I can say it runs anywhere from 15 to 30 cents an hour.

Q. What would be the wages at Southern ports—at Charleston and Savannah?—A. At Savannah, 22 cents both for regular and overtime.

Q. What is it at Boston?—A. At Boston it is 20 cents for regular time and 30 cents for overtime.

Q. You mean to say that the Boston wage is cheaper than the Savannah?—A. Yes; it is slightly cheaper. The overtime wage is greater, you see, and the regular time is less.

Q. I can not see how that would be. I supposed the wages at all those Southern ports were less than 20 cents an hour.—A. There is a notation here of 174

cents per hour—at Savannah also. There is also a notation of 22 cents at Savannah. So I suppose the price will fluctuate between those figures as the supply exists.

Q. (By Mr. FARQUHAR.) I would like to ask if the stevedoring at any of your ports is done by organized labor?—A. The stevedores may have their organizations among themselves, but if they have, the fact has never been brought to our attention in any way. There is never any difference between the company and its labor.

Q. You find a regular rate prevailing at every port?—A. We find a regular rate, and we presume there must be an understanding among the men. We never dispute those wages, but pay them.

Q. In case of any infraction of the rules to whom or to what tribunal does the application go on the part of the plaintiff—the United States court?—A. You mean for personal injuries sustained?

Q. Yes; or maltreatment or lessening of wages or difference in the construction of the terms of employment—transfer of employment from one character to another—that would be made the basis of a suit for damages. In what court is the suit entered?—A. That depends entirely on circumstances. If the situs of the injury occurs on land or if the contract should not be a maritime contract they would have their redress in the State court; but if the injury occurs on ship, or the contract be a maritime one, they would also have recourse both to the State courts and the United States courts in admiralty. The election, however, seems to be for the State courts, because they secure responsive juries there, probably with the view of putting themselves upon the country, and they seem to select the State courts.

Q. You think there is sufficient law and means of redress so that a sailor, a seaman, or petty officer, or any one in your general employ, not a master, may find his remedy in the courts?—A. Absolutely. He is completely protected, I should say, and a little more so than the owners, and, perhaps, properly so. The most common method among sailors in seeking redress for what they consider wrongs against them is to apply to the United States commissioner, an official appointed by all United States district courts, who cites all parties to appear before him and hears the case. When the commissioner fails to settle the difficulty, and he feels it is a proper case for the court to take up, he passes it on to the court for hearing; otherwise the matter is then and there dismissed.

Q. In the matter of rations, you said you had adopted the ocean ration, as provided for by the amended Senate bill of 1898, I presume?—A. Yes; we have been compelled to put that in the shipping articles, and are therefore compelled to follow it.

Q. Did that law of 1898 say the coastwise trade should be provided with that ration?—A. It was a question of some doubt, but after some investigation by the Attorney-General of the United States he came to the conclusion that the law was broad enough to cover the coastwise vessels; but as to whether or not it was the intention of Congress to do so I think is a matter of considerable doubt. Certainly it will not improve the condition of the sailors if the lines should insist on following the scale of provisions provided by that law, because if they are allowed to give them what they wish to give them, and what is less expensive to give them, because of the additional amount of supplies they are required to put on board for their regular passenger traffic, the seaman fares a great deal better in every way, and he gets the best the land affords.

Q. There is no provision, is there, in case of an excess of rations, in cashing it in for the benefit of the sailor?—A. I can hardly see how that could be done unless he had some way of keeping the provisions given him; he is permitted to eat all he wants and has no more coming to him. I think the sailors are well satisfied, and things seem to be floating along very smoothly.

Q. Now, in your matter of loading, where you engage local stevedoring, in your articles is it provided that the class of men who operate your ships shall assist in the loading and unloading?—A. The articles do not provide for that, because the ship men do not assist in loading and unloading. We have regular gangs of stevedores, and the ship men are confined to the navigation of the vessel.

Q. What is your ordinary seaman and the helpers engaged in while in port?—A. Cleaning up, inspection, seeing that the ship is in proper trim.

Q. So it is not a holiday when you reach port?—A. It is not a holiday nor is it at all excessive work, but they have enough to keep them busy.

Q. Do any of your masters give the men a furlough of a few hours in cities when you come to the terminals?—A. There is such a custom.

Q. Are your men usually married men with families and having homes at any of your terminals, or are they single men?—A. The officers often are married; the

seamen are not tied down by family relations as a rule, although there are quite a number that have their homes at the terminals.

Q. What is the proportion of Americans?—A. About 75 per cent in our own force.

Q. Where do you usually find your men, in New England or along the Southern shores?—A. A great many seamen come from the New England States, but they seem to come from all the ports. A large number come from Baltimore. Generally speaking, they come from the main terminals.

Q. (By Mr. C. J. HARRIS.) Do you have any colored seamen?—A. No colored seamen to my knowledge.

Q. (By Mr. FARQUHAR.) Are the stevedores in the South colored?—A. Largely.

Q. South of Baltimore?—A. Yes; I may say nearly all of them in the South are colored. The average on the line is about 55 per cent white and 45 per cent colored.

Q. At all ports?—A. Yes; taking the general average.

Q. I presume, if you have a table of the wages and compensation it would be well to give it at this place.—A. The pay roll of the crew is as follows: Masters, \$150 to \$250 a month; first officers, \$75; second officers, \$55; boatswains, \$30; quartermasters, \$30; sailors, \$25; chief engineers, \$120; first engineers, \$75; second engineers, \$60; oilers, \$40; water tenders, \$40; firemen, \$40; coal passers, \$30; stewards, \$55 to \$70; first cooks, \$50 to \$60; second cooks, \$35; mess men \$20 to \$25; waiters, \$20 to \$25; pantrymen, \$20 to \$30; stewardesses, \$18. Board and accommodations are given in addition to the above figures. The number of cooks and waiters is of course regulated by the demands of the passenger season; in the summer season a great many more are employed than in the winter season. I have spoken as to the compensation of stevedores before.

Q. You have as to the stevedores in three ports, I believe?—A. I will give all of the ports. At Boston, regular time 20 cents an hour, overtime 30; Baltimore, regular time 20, overtime 30; Providence fluctuates between 16½ and 18½ for regular time, overtime 20 to 25; Norfolk, regular time 15, overtime 15; Newport News, regular time 15, overtime 15; Savannah fluctuates from 17½ to 22 regular time, overtime 17½ to 22; Philadelphia, regular time 20, overtime 20.

Q. Have you any knowledge as to how those figures compare with the wages paid by ships in the foreign trade?—A. No; I have no knowledge as to that. I presume they would have to pay the stevedores about the same prices.

Q. As to the wages of your masters and crews, would they be about the same?—A. No; I think the wages paid by the foreign trade are very much less.

Q. What method have you adopted in the inspection of vessels?—A. As regards that, it may be divided into 2 branches. There are two forms of inspection, one by the Government and one by the owner. The local Government inspectors are divided into hull inspectors and engine and boiler inspectors. They make an annual inspection. The report on that inspection is kept permanently posted on shipboard. The owner's inspection is divided into a number of classes. Among others there is the voyage inspection and the departmental inspection of everything, and the periodical docking and general overhauling. The most important probably is the inspection immediately preceding the voyage, at which time all the machinery is turned over and tried; the engines are always kept running 15 or 20 minutes before starting, to see that everything is all right; all the appliances are tested; the electrical superintendent goes aboard and tries all the electrical appliances. In that way the line is kept up in proper form.

Q. (By Mr. C. J. HARRIS.) That is the private inspection of your own company officers?—A. It is the private inspection which is made necessary under the laws in order that the ship may be seaworthy and that there may be no negligence on the part of the owners in embarking on the voyage.

Q. Is there a public-inspection officer?—A. The public or governmental inspection occurs annually. Then all of the ship—the hull, the machinery, and all the appliances are fully tested.

Q. That public inspection is merely a form, then, is it not?—A. No, sir; it is most thorough, and is done in great detail.

Q. If your vessels are only examined once a year by public inspectors, the whole vessel might be in very bad shape the second trip it made after it was inspected?—A. That is rather an impossible condition for this reason: The owners find that in keeping the vessels up there is a less percentage of deterioration. The deterioration on sea property would probably run as high as 10 per cent per year if the vessels were not kept in prime condition. By keeping the repairs up the deterioration is a very low percentage. Then there is another condition that makes the owners unusually alert. If the vessel starts in an unseaworthy condition and some accident happens through any imperfection that might have been discovered

by careful inspection, every policy of insurance on hull and cargo is vitiated by the unseaworthy condition of the vessel, and every bill of lading issued on the cargo is made null and void; and that extends to nearly a million dollars worth of property. So the owners are bound to be very alert in inspecting and watching and caring for it.

Q. (By Mr. FARQUHAR.) Do you know how much they mark off annually for deterioration?—A. That I am unable to say. I have no knowledge of what comes up before the executive board.

Q. (By Mr. C. J. HARRIS.) What is the rule as to the loading or overloading of vessels?—A. That finds its regulation in the same condition of affairs. A vessel that is overloaded is unseaworthy. Further than that there is the regard that the master and the crew have for their own personal safety. The crew have the right to object to going to sea in a vessel that they feel is in an improper condition, and there is even more strength in these conditions of affairs than in any legal verbiage that may be established to prevent the overloading of vessels.

Q. Are all your steamers passenger steamers?—A. To my knowledge all carry passengers.

Q. What is the value of the passenger traffic as compared with the freight?—A. Of course, as with all transportation companies, the freight is the backbone of the business. I could not tell you the percentage, but the passenger business is remunerative, both on railroads and steamships; otherwise, adopting a sound business policy, they would not be carrying them.

Q. You run your boats for the freight, I suppose; that is the first consideration?—A. That is, of course, the first consideration.

Q. Now, then, I would like to take up the commercial features of this coastwise trade, its relations to the railroads, and competition, if any, with the railroads. You virtually cover the Atlantic coast from the North to the South?—A. From Boston to Savannah.

Q. And intermediate points; is the competition with the railroads very severe?—A. That is a question upon which probably my experience is not as broad as you might like to have. I can only state in a general way. That is in the domain of traffic. The largest class of competitive traffic on the coast, I believe, is from the sailing ships. I do not know that the railroads or the steamship lines have any great conflict in their business relations. Before and during the establishment of water differentials there was quite an objection to the water lines by railroads, but I believe that the inevitable is now recognized, and they are getting along harmoniously.

Q. What is the relation, or rather, what is the percentage of your steamboat rates to the railroad rates between any two different points that you might name?—A. That question I could not answer definitely. I have here a statement made by the traffic people that I might read.

Q. I wanted to get at how much lower these steamboats had to put their rates in order to get their share of the traffic?—A. Well, you understand, generally speaking, that there are differentials which the water lines are allowed to make in any rate by reason of the difficulties that the water transportation involves, such as carrying insurance and so on, and there is a class of business that has grown up under these differentials that may be considered as belonging exclusively to the water lines, so there is no great amount of conflict between the water and rail interests. There is a certain amount of business which goes to the boats because of the advantage of the lower rates.

Q. You mean to say there is a combination or an understanding of prices between your lines and the railroads?—A. Not at all, because the water lines experience a competition that entirely sets that feature aside; that is, the competition of the sailing vessels, which the water lines are required to meet. Sailing vessels are chartered, the owners do not run lines, but give a boat up to a man for so much money, and the rate is secured by figuring on the charter price and the gross tonnage aboard to ascertain what it is. That fluctuates greatly on the coast.

Q. Is your line under the control of any railroad company?—A. It is entirely independent of any and all other companies.

Q. (By Mr. FARQUHAR.) What body establishes the differentials?—A. The lines settle that, I believe.

Q. Is it done through the Interstate Commerce Commission or by agreement with the lines?—A. No; I believe it has grown up as an inevitable result of the conditions confronting transportation people. I think it is a natural growth.

Q. These differentials are generally accepted?—A. Generally accepted.

Q. Have you any classification of freight?—A. Yes.

Q. Approaching anything like the railroad classification?—A. The same.

Q. The same by water transportation as by rail?—A. I believe so, except where there are certain conditions that must be met that the rail lines do not experience.

Q. (By Mr. C. J. HARRIS.) You would have the same classification on articles shipped partly by rail and partly by water?—A. Very often that is so. You see the question of classification, while a natural development, has received the attention of the experts, both on the part of transportation lines and the public, and we may assume that such a development is within proper bounds.

Q. Does much of your freight go over the railroads?—A. A good proportion, I believe. Of course large freights are carried direct from the ports at rates that the railroads would probably find unremunerative. The merchants have adopted a plan of centralizing their points of distribution, and very often they ship to local ports and distribute from them. I find in reading the papers that there is an institution in the west shipping oranges now, and they have them moving on the road ready to divert and ship on telegraphic advice. The cars are going all the time. That is enlarging on that plan of distribution. They simply start a car right out and let it go.

Q. (By Mr. FARQUHAR.) You said you had some statement there in regard to freight?—A. Yes, the statement is this: [Reading:] "There is not much competition on the part of railways and local coastwise business between the ports covered by steamship lines; the sail competition and trade conditions occasion such low and fluctuating rates between ports as to make the business apparently unremunerative for rail carriers, although in some cases they maintain the same rates as the basing rates of the steamship lines, and in other cases, especially the longer hauls, they carry much higher rates. The only comparison that could be made of the rates of the steamship lines and the rail lines would be the fixed rates of the rail lines with the basing rates of the steamship lines, but as a comparatively small portion of the business is handled by the steamship lines on these basing rates, the comparison would be misleading, the steamship lines being obliged to handle a great portion of their business on commodity rates made to meet the exigencies of the case."

Q. So your commodity rates make a great deal of difference?—A. Yes.

Q. You meet the most uncertain conditions through the commodity rate?—A. Through the commodity rate.

Q. Have you a table here that explains the character of your freight?—A. No, I have not.

Q. You have nothing that shows the article of which the highest tonnage is carried?—A. We have not, but our records show that lumber, pig iron, resin, fertilizer, cotton, canned goods, grain, rails, and iron, are among the principal articles.

Q. (By Mr. C. J. HARRIS.) What do you say as to your competition with other coast lines under the control of railroads? Do you find they have an advantage over you in any way?—A. I do not think that I am sufficiently familiar with that point to answer that question. I do not now recall any such condition existing.

Q. Does not the Georgia Central own a line of steamers?—A. Yes; they run into New York, I believe.

Q. Now, how do their rates compare with yours? Does the Georgia Central Railroad give you the same rates to interior points in competition that they can give on their own line?—A. Yes; as I understand it there is no discrimination.

Q. Then they would have no advantage over you?—A. I do not see that they would; but still that is a question that probably would be better answered by a traffic man.

Q. (By Mr. FARQUHAR.) Have you a table that shows the passenger rates between the various ports?—A. I have, sir. They are as follows:

BALTIMORE AND BOSTON OR PROVIDENCE.

First-class	a \$10.00 to b \$12.50
Round trip	a 20.00 to b 22.00
Intermediate	a 9.00 to c 11.00
Intermediate excursion	a 18.00 to c 20.00
Steerage	a 8.00 to b 10.00

NORFOLK AND BOSTON OR PROVIDENCE.

First-class	a \$9.00 to b \$11.00
Round trip	a 18.00 to b 19.00
Intermediate	a 8.00 to c 10.00
Intermediate excursion	a 16.00 to c 18.00
Steerage	a 7.00 to b 9.00

a Rates Oct. 1 to May 31.

b Rates June 1 to Sept. 30.

c Intermediate rates do not apply on Boston line June 1 to Sept. 30.

First-class rates include meals and stateroom berth. Upper-deck stateroom berths on Boston Line are \$1.50 extra in each direction, June 1 to September 30. Intermediate rates include meals and berth. Steerage rates include meals and bunk.

BALTIMORE AND SAVANNAH.

First-class	\$15.00
Round trip	25.00
Intermediate	12.50
Intermediate excursion	22.00
Steerage	10.00

PHILADELPHIA AND SAVANNAH.

First-class	\$17.50
Round trip	29.00
Intermediate	15.00
Intermediate excursion	24.00
Steerage	10.00

First-class and intermediate rates include meals and stateroom berth. Steerage rates include meals and bunk.

NORFOLK, NEWPORT NEWS, AND BALTIMORE.

First-class	\$3.00
Round trip	5.00
Steerage	2.00

First-class rates include stateroom berth; meals extra. Steerage rates include bunk; meals extra.

Rates of fare given herein are subject to change without notice.

Q. (By Mr. C. J. HARRIS.) Were your vessels all built in this country?—A. Yes, sir.

Q. What do you say of your competition with the sailing vessels of the coastwise trade?—A. That at times has been very active, as I understand it, a very vigorous competitor for coastwise business.

Q. What are your advantages over the sailing vessels?—A. I suppose better service, certain service, higher-paid employees, less liability of accident, these and various other advantages, but they scarcely weigh in the balance against a lower rate, and sometimes it is necessary to meet the conditions as they exist.

Q. On very heavy commodities in large quantities, where time was not so much an object, could you compete for that trade at all?—A. That depends entirely upon the tonnage capacity and condition of the boat. Sometimes vessels running require a certain amount of ballast, and if they are light I suppose there are times when business might be carried for less money than at others. It depends entirely upon the business offering.

Q. Well, take for instance coal; you don't attempt to compete?—A. We do not attempt to carry coal, or any bulky thing of that kind.

Q. You do carry lumber, don't you?—A. Yes, I have reference to bulk in small particles; lumber we would call by the piece.

Q. (By Mr. FARQUHAR.) Many of your vessels engage in carrying fruit in the season very largely, do they not?—A. Yes, fruit and vegetables compose some portion of the cargo; more vegetables, however, than fruit, and in order to keep pace with that traffic the steamship companies find they are required to put in ventilators. It is very expensive to keep pace with the times.

Q. Are your vessels built with refrigerators? Do you not have compartment refrigerators?—A. I do not know of any refrigerating process except pantries; there may be; that is in the department of construction, and I am not fully informed on that.

Q. (By Mr. PHILLIPS.) Can the railroads compete with you in carrying fruit or vegetables from the South?—A. Well, sometimes they secure the business.

Q. Your rate of freight is generally less than the rate is by rail, is it not?—A. There is a water differential in favor of the water line. It is made necessary by the inherent condition of things. The water lines are required to carry marine insurance, which the railroad lines do not. They have very often more occasion for transfer; and the hazards of the great deep are also conditions to be taken into consideration.

Q. Do you ever make shipping rates with railroads to harmonize?—A. That would come under the traffic division. I suggest that on points of traffic perhaps

I am not a good witness. I have understood you want us to speak of things we absolutely know by actual experience, not from hearsay.

Q. (By Mr. FARQUHAR.) Is there any other topic you have there that you want to touch upon?—A. You refer here to "forms and characters of aid and subsidy to American vessels." * * * The subsidy act seems to have found its incentive in the protection of American shipping against foreign bottoms. The domestic lines suffer no encroachment from foreign bottoms, and they, so far as the Merchants and Miners' Line is concerned have not asked for or gotten any assistance in any way. I do not think that the condition exists in the coastwise trade which might be used as an argument for the subsidizing of American coastwise bottoms as against foreign bottoms.

Q. Have your people ever considered that the registered foreign-built ship could enter into the coastwise trade?—A. We have always felt that there was a policy expressed in various ways against foreign vessels taking coastwise business, whether they made a particular business of that, or whether the foreign ships touch at various ports on their voyages to receive and deliver. That is provided against in the law and zealously watched by the custom-house officials, and we think that is the safeguard for the American coastwise merchant marine, because under the plan of enrollment, entering and clearing, they can check it. It is illegal for foreign vessels to transport any business on the coast; that is, any local business on the coast.

You refer to the condition and treatment of passengers. I would state that our passengers—cabin passengers (we have no experience with immigrants)—have the same accommodations that are found in the best of hotels. As to the effect of quarantine and health laws on ocean commerce, we find that sometimes our ships are delayed by reason of quarantine, but the delay is for the general good. All of the quarantine officers are most earnest in their endeavor to make that delay as light as possible, and we have nothing to say against the laws as they are established.

As to the vessels engaged in transportation of live stock, our line carries live stock, and provision is made for watering and feeding, and for separate stalls and dunnage. Live stock is carried under contract just the same as any other freight is carried.

Q. (By Mr. CLARKE.) Your traffic is confined to the ports north of Florida, is it not?—A. It is.

Q. You have not engaged in the West India trade at all?—A. No, sir; we are strictly coastwise and have nothing to do with foreign business, and have never had any experience with it.

Q. What proportion of this coastwise traffic between the ports where your vessels trade is carried by steam vessels and what proportion by sailing vessels?—A. That being a question of traffic would be very difficult for me to answer, but I hardly think that a traffic man could give you satisfactory light on that subject. Very often business is taken without the regular liners knowing anything about it.

Q. Have you any opinion whatever concerning the relative proportions?—A. I could not have, because it would not be based upon any experience.

Q. What is the class of freight generally carried?—A. That is another question that I have had propounded to me and I confess that I have not the information at hand, but I think the company might be able to furnish it.

Q. You said something about an apparent difficulty in punishing for a theft committed within the borders of a State in the coastwise trade. If one passenger should steal from another or one member of the crew should steal from another or from a passenger, is there no way of punishing that offense as a crime through the courts?—A. I have never yet been able, after very diligent search and also conferences with the various commissioners along the coast of the United States and the district attorneys, to place my hand upon a law that could be invoked to charge anyone with a misdemeanor or crime of larceny, whether committed by a passenger or sailor or seaman *when committed within the borders of a State*. I should explain here that Revised Statutes, 5356, to which I have previously referred, includes the offense of larceny when committed by anyone on the high seas or territory over which the United States has exclusive jurisdiction and Revised Statutes, 4596, covers the offense of embezzlement and the damaging of ship, stores, or cargo wherever the act is committed, providing, however, that the act is committed by one of the ship's company.

These acts obviously omit a passenger on a vessel when the offense is committed within the border of a State, and unless the crime of larceny can be read into Revised Statutes, 4596, the members of a ship's company are not covered when the act is committed within a State.

It is true there should be a remedy in the State courts, but the location of the act is always in doubt. There is no certainty of the precise locality of the commission of the act, and if the State courts are used and the act, though committed,

is proved not to have been committed within the State the State court would have no jurisdiction and the case would be dismissed, and probably an action for false imprisonment might result.

The jurisdiction of the United States courts should be broadened so as to give them concurrent jurisdiction with the State courts over the offense of larceny when committed on shipboard within the borders of a State.

Q. There are statutes against other offenses providing for their punishment?—A. Quite full. For instance, there is a statute against embezzlement and other offenses, but I think probably the difficulty arises because of the fine distinction between statutory crimes, and probably this condition has never presented itself to our legislators.

Q. Do you mean to express the opinion, then, that if a person commits a theft on one of your vessels within the jurisdiction of a State that that person could not be prosecuted?—A. Not in the United States courts. I have found, I think, sufficient law to apprehend anyone who is engaged to the ship under a law that punishes him for damaging the freight and cargo. (R. S. 4596). That might be considered broad enough to cover the ship's company, but further than that I have not discovered any rule or law that would cover it, and would be very glad to be enlightened on that point.

Q. Would that be broad enough to cover theft of one passenger from another?—A. I think not.

Q. (By Mr. PHILLIPS.) Could the passenger not be arrested when he lands at the first port?—A. Yes, anyone, whether a member of the ship's company or a passenger, could be arrested and tried under the State laws if we could be certain that the offense was committed within the State in which the port is located, but that fact could not be ascertained until the proofs are in and the case heard. When the State courts are used there is always doubt as to the jurisdiction.

The offense of larceny, whether committed by the ship's company or by passengers, seems to be well covered on the high seas, or when committed in any place over which the United States exercises exclusive jurisdiction, but it is not covered in the United States statutes when committed within the borders of a State, leaving the only remedy in the State courts, and the precise location of the act is usually so uncertain that the State courts can not with safety be used. Another feature is, if the ship arrives at a port within a State other than that in which the act is committed, the offender can make his escape before requisition can be made from the State in which the act was committed.

Jurisdiction being delegated to the United States District Courts in admiralty matters, we might be able to find redress in that way, but I have not been able to discover a specific United States statute defining the offense of larceny as a crime and misdemeanor and providing a punishment therefor when the act is committed within a State.

Q. (By Mr. CLARKE.) Would you be willing to have such a statute recommended to Congress?—A. I think it would be quite desirable. I don't pretend to say I have made an absolutely exhaustive search, but I have endeavored to discover such a law and have been unable to do so; if it does not exist, I think it quite desirable.

Q. If you think such a statute is necessary would you be willing to formulate a draft?—A. I would be glad to submit a tentative suggestion.

Q. (By Mr. C. J. HARRIS.) Are there any other topics now that you have notes on and on which you wish to make brief remarks?—A. I have taken the pains to read very carefully the suggestion of Mr. Furuseth, secretary of the Sailors' Union, because the Merchants and Miners' Transportation Company has always been very solicitous about the condition of its employees, and I find that the ideal condition that he suggests for the amelioration of the condition of seamen, contained in his examination on page 691 of your volume on transportation, seems to be fully covered by the advanced position which we have taken with regard to seamen in our "shipping article." Mr. Furuseth reads from a law which the seamen themselves drafted to amend the laws relating to American seamen and to improve the personnel of the merchant marine, and he makes various suggestions to your commission, as follows:

(1) "We propose to abolish crimping altogether, as far as it can possibly be abolished by law." That has been abolished under our plan, because the American coastwise trade is permitted to sign their crew direct, which we do, so that there are no intermediaries—crimps, runners, and the like—coming between the company and its sailors.

(2) "We propose to increase the space in the forecastle." * * * Our boats are built, of course, under the laws and regulations, and all of those provisions

are fully complied with, and the construction does not fluctuate and change as with the caprice of individual owners of private vessels.

(3) "To give the seaman one-half of what is actually due him in every port where he loads and discharges cargo." That is a very important provision, of course. When the seaman receives his money in small and regular installments he has not as large an amount of money to spend as if it was laid up for him, and he has not the temptation to spend it before he has earned it. Our company has adopted the policy of paying seamen monthly, just the same as any other employee, and they get along with that. I presume that is contrary to the ordinary plan of shipping in the individual vessels. * * *

(4) "And to give the seaman the right to call for a survey of any vessel that he may happen to be in without the officers of the vessel taking part in the request." * * * His relief there is found in the fact that he can leave at any time if he does not want to continue. There is no requirement for him to go to sea if he does not wish to, and the company has taken a broad view that with a man who is discontented with his position it is better, perhaps, to let him go if he chooses to leave; but we have had very few grievances of any character.

Then Mr. Furuseth further says: (5) "And to establish a standard of skill and experience for those who sign as able seamen." * * * Of course, the company has its method of selecting its employees, and they are not selected at random by some chap who is interested largely in the amount of money he can make out of it. We take an immediate interest in the personnel of the ship. * * *

(6) "And to get a law providing for the standard or number of men to be carried by vessels according to their tonnage and rigging." Of course, an owner is obliged to have a vessel properly manned to be seaworthy and within the scope of their insurance policies—they are very solicitous about having the ship fully protected in that respect.

Thus, I think, we have rather anticipated the seaman's desires, and I am very happy to observe that we have done so. Outside of this I do not know that I have anything further to say.

Q. (By Mr. FARQUHAR.) What have you to say as to the prosperity of the coastwise trade, so far as your knowledge goes and the experience of your own line?—A. I doubt whether I could give a satisfactory answer to that question, because I am not familiar with the revenue feature.

Q. Have the dividends of your line been satisfactory to your stockholders and directors?—A. I think there has been no discontent in that respect. They have been pretty regular; in fact, I may say regular.

Q. Have you enlarged your stock to build new boats, or have you used your surplus to build new boats?—A. Our vessels have been built both from funds derived from increase of stock and from earnings.

Q. (Mr. C. J. HARRIS.) Has your volume of trade been on the increase, or does it stand still, or decrease?—A. I should suppose it would be on the increase, as all progressive business naturally increases with the increase of general prosperity.

Q. We want to know whether it is progressive, or whether it is retrograding, or no?—A. It is progressing, but there are so many hazards connected with the great deep that there can be no anticipation of permanent prosperity. There has been general progress with us just the same as there has been general progress in all industrial and other lines recently in this country, and we must necessarily feel the relation.

(Testimony closed.)

EXHIBIT ATTACHED TO TESTIMONY OF MR. DANIEL H. HAYNE.

BALTIMORE, MD., March 23, 1901.

To the Honorable the Members of the Industrial Commission, Washington, D. C.

SIRS: In accordance with your request, I have looked over the law in regard to larceny when committed on shipboard, and find that sections 4596 and 5356 are the statutes I had in mind when I gave my testimony before the commission. These statutes are as follows:

"R. S. 4596. Whenever any seaman who has been lawfully engaged, or any apprentice to the sea service, commits any of the following offenses, he shall be punishable as follows:

* * * * *

"Eighth. For wilfully damaging the vessel, or embezzling or wilfully damaging any of the stores or cargo, by forfeiture out of his wages of a sum equal in amount

to the loss thereby sustained, and also, at the discretion of the court, by imprisonment for not more than twelve months.

"R. S. 5356. Every person who, upon the high seas, or in any place under the exclusive jurisdiction of the United States, takes and carries away, with intent to steal or purloin, the personal goods of another, shall be punished by a fine of not more than one thousand dollars, or by imprisonment not more than one year, or by both such fine and imprisonment."

I find, in going over my testimony, I did not intend to make the assertion so broad that there was no act to apprehend an offender for larceny when committed on the high seas. The difficulty has been principally with ship's employees who were guilty of larceny, and you will see by the inclosed acts that there is no remedy in the United States district courts for an offense committed by one of the ship's crew or by a passenger when the location of the crime is within a State.

Revised Statute 5356 is broad enough to apprehend any offender in the district courts of the United States when committed on the high seas or on territory exclusively within the jurisdiction of the United States. This act would leave out both passengers and the ship's company (in which expression I mean all who are connected to the vessel by contract) when the crime was committed within the jurisdiction of a State, and the secrecy surrounding the commission of the act is such that the owners of vessels can not determine, before the proofs come out on the trial of the case, just where the act was committed, so that it is very risky to apprehend an offender under the State laws.

Of course, where the act is known to be committed on the high seas, or on territory exclusively under the jurisdiction of the United States, there can be no doubt of the remedy in the United States courts.

We have, therefore, been required to use Revised Statute 4596, which permits us to apprehend any of the ship's company for damaging the vessel, embezzling, or damaging the ship's stores and cargo. Under this act, however, we can not apprehend a passenger in the district courts, nor could we apprehend one of the ship's company under the specific charge of larceny. We might apprehend any of the ship's company under the charge of damaging the cargo.

You will realize that when a vessel arrives at a port, and immediate action is necessary to apprehend an offender, an immediate decision of where the offense was committed must be reached, for if it was not committed within the State to which we would then apply for redress, there would be a failure of jurisdiction and probably a subsequent suit for false imprisonment. Since a vessel passes through so many States, with conflicting jurisdictions, it is desirable that there be sufficient authority under the laws of the United States to apprehend the offender at once and bring his case before the United States officials before he has opportunity to escape.

With an act conferring upon the district courts jurisdiction for larceny when committed on maritime waters within a State, there would then be no doubt as to the method of procedure, under Revised Statutes 4300 to 4305, which provide for summary trial.

The procedure in the United States courts would be to have a warrant issued by a commissioner of the court, who would hold a preliminary hearing, and if the evidence was sufficient an indictment would immediately issue and the court would grant a speedy trial if the circumstances justified, and there would be such uniformity in the method of procedure for larceny on the navigable waters that the shipping community would become familiar with the methods. The same procedure would pertain at any port where the vessel touched; but under the present doubtful condition of the law they are required to subject themselves to the State laws, which, because of their difference, are confusing and uncertain.

I inclose herewith drafts of two bills, either of which would, in my opinion, be sufficient to apprehend a member of the ship's company, but if it is desired to make the matter broad enough to cover both seamen and passengers, I would recommend the adoption of Revised Statute 5356 as amended.

If it be said that the United States has no jurisdiction over these offenses when within the borders of a State, I think the answer to this is that the United States has jurisdiction, under a proper interpretation of the Constitution, to define crimes and provide for their punishment on the navigable waters of any State, so as to give the United States courts concurrent jurisdiction with the State courts over such crimes.

As I did not have the volume containing the statutes before me, I stated that there was no redress when the act of larceny was committed on the high seas, and I have taken the liberty of correcting my evidence to agree with the statutes, and also have corrected the questions to show a proper relation to the answers.

It will give me great pleasure to be of any further assistance within my power.

Very respectfully,

DANL. H. HAYNE, *General Solicitor.*

[Inclosure 1.]

AN ACT to amend section 4596 of the Revised Statutes of the United States, relating to offenses and punishments.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That subsection eight of section 4596 of the Revised Statutes of the United States be, and the same is, amended to read as follows:

Section 4596, subsection eight. For wilfully damaging the vessel, or embezzling or wilfully damaging any of the stores or cargo, or taking or carrying away with intent to steal or purloin the personal goods of another, or receiving any stolen money, goods, chattels, bonds, bill obligatory, bill of exchange, promissory note for the payment of money, bank note, paper bill of credit, certificate of any State or the United States, knowing the same to be stolen, by forfeiture out of his wages of a sum equal in amount to the loss thereby sustained, and also, at the discretion of the court, by imprisonment for not more than twelve months.

[Inclosure 2.]

AN ACT to amend section 5356 of the Revised Statutes of the United States, relating to crimes arising within the maritime and territorial jurisdiction of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section 5356 of the Revised Statutes of the United States be, and the same is, amended to read as follows:

Section 5356. Every person who, upon the high seas, or in any place under the exclusive jurisdiction of the United States, or upon waters within the maritime jurisdiction of the United States, takes and carries away, with intent to steal or purloin, the personal goods of another, or receives any stolen money, goods, chattels, bonds, bill obligatory, bill of exchange, promissory note for the payment of money, bank note, paper bill of credit, certificate of any State or the United States, knowing the same to be stolen, shall be punished by a fine of not more than one thousand dollars, or by imprisonment not more than one year, or by both such fine and imprisonment.

WASHINGTON, D. C., April 6, 1901.

TESTIMONY OF M. C. MARKHAM,

Assistant traffic manager Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad.

The commission met at 10.47 a. m., Mr. Farquhar presiding. At that time Mr. M. C. Markham was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will give your name and address and official position to the stenographer.—A. M. C. Markham, assistant traffic manager of the Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad; my address is Chicago.

Q. How long have you been connected with railroading, and especially with the Illinois Central?—A. I have been railroading since 1869—32 years—and have been with the Illinois Central 25 years.

Q. Have you any prepared statement in answer to the general inquiries in the topical plan of inquiry on the subject of transportation to present to the commission?—A. Yes; I have prepared a short statement.

Q. The commission would be pleased to hear it.—A. The witness then read as follows:

In response to the request of the honorable Industrial Commission I appear before it to give such information as is within my knowledge as to transportation on the Mississippi River, methods employed, volume of traffic, and the effects and influences of this river transportation on the railroads.

Prior to 1870 the Mississippi River and its tributaries transported the greater part of the freights and passengers to and from the States traversed by them. Since then the construction of a large railroad mileage in the Mississippi Valley has somewhat diminished the volume of traffic handled on the rivers.

In 1870 there were only 27,182 miles of railroad in 18 States of the Mississippi Valley. In 1900 there were upward of 110,000 miles of railroad in these same States, or over four times as much.

The trade records show a decreased tonnage movement by the river year by year, yet the total vessels and volume of business is still very large. A statement of the river trade compiled by the Census Bureau for 1889 showed the magnitude of the commerce conducted thereon. From this statement we find there were 7,445 vessels plying on the rivers, having a capacity of 3,393,378 tons. For that year there were transported on the rivers 10,558,894 passengers and over 81,000,000 tons of freight.

As the important trade centers situated on the Mississippi River and its tributaries, such as New Orleans, Vicksburg, Memphis, Cairo, Paducah, St. Louis, Dubuque, St. Paul, Evansville, Louisville, and Cincinnati, have for some time past been fully served by the railroads, it is natural that the latter should share in the trade formerly controlled by the river craft. As a consequence of the more expeditious movement and improved facilities afforded by the railroads, the river traffic has appreciably declined. This is shown by the decreased movement from the important trade centers situated on the river, and is further accentuated by the withdrawal or nonexistence of some of the steamboat companies which operated on the river in the eighties and earlier. There is still a large business done on the river, however, on special commodities, such as grain, flour, lumber, sugar, molasses, cotton seed, and miscellaneous freights, both to points reached by railroads and to way landings.

The barge lines are important factors in river transportation on account of the large tonnage capacity and cheapness with which they can conduct the business.

The St. Louis and Mississippi Valley Transportation Company organized a barge line early in the eighties. It represented the consolidation of 3 barge companies previously in existence. The St. Louis Merchants' Exchange Report for 1882 said of this company:

"The new organization has ample means and facilities for handling with dispatch all the business that may be doing. * * *

"In order to show how great the facilities of the transportation company alluded to are for handling the bulk grain, it can be stated that there are now in use 98 barges and 13 towboats. The capacity of a barge is from 50,000 to 60,000 bushels, and it can be loaded quickly from the spouts of the elevators. A towboat will often start from St. Louis with 4 to 6 barges attached, or, in other words, with a cargo of from 200,000 to 300,000 bushels of bulk grain, besides other kinds of freight, as these barges are so constructed that any and all kinds of freight can be carried. The consolidated line has a capacity of moving 3,000,000 bushels of grain per month."

In November, 1900, a new steel barge line, consisting of a towboat and 2 barges, went into operation between St. Louis and New Orleans. The boats are designed to draw not to exceed 9 feet of water, and great success is predicted for them. This line will, of course, meet with strong competition from the old barge line, which is still in existence. The new barge line has already made 3 trips, and the owners seem to be very confident of success, although the last trip took 54 days from St. Louis to New Orleans and back.

In 1880, the receipts of grain at New Orleans by river were 15,762,604 bushels; of cotton, 1,087,522 bales. For the same year St. Louis received and shipped by river nearly 2,000,000 tons of freight. Since then very marked changes have taken place in the commerce movement of the Mississippi Valley. Railroads have been built into the territory formerly served by the river. The gradual improvements in roadbed, equipment, and general facilities of the railroads enable them to compete more actively with the river and conduct the traffic with decreased expense.

Lines of railroad run close to the river on both sides, nearly all the way from New Orleans to St. Paul, and New Orleans to Louisville and Cincinnati. Aside from all these, there are other lines of road which detour from the river, yet connect the chief trade centers and control the traffic that was formerly taken to the river by rail and thence forwarded by boat.

The statistics of river trade are very meager, but such few as are obtainable show that the business is not increasing.

Coal received at St. Louis for the years named.

	1880.	1890.	1899.
	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
By river	1,639,875	2,638,500	908,750
By rail	40,232,481	67,439,725	108,159,125

Forwarded.....	2,755,680	5,270,850	9,180,300

The cotton receipts by river at New Orleans in 1880 were 64 per cent of the entire cotton receipts of that place; in 1890, 20 per cent; and in 1899, only 15 per cent, showing a large decline in the river cotton trade. The rail receipts, on the other hand, were in 1899 over 300 per cent of what they were in 1880.

Cotton receipts at New Orleans.

	<i>Bales.</i>	<i>Bales.</i>	<i>Bales.</i>
By river.....	1,087,522	425,828	343,450
By rail.....	627,577	1,722,473	1,935,177

Of 734,027 barrels of flour received at New Orleans in 1899, only 71,962 were brought by river.

Of 37,479,500 bushels of grain received the same year, only 2,754,928 were brought by river.

In 1884, New Orleans received by rail 1,135,272 tons of all kinds of freight; in 1900, 4,312,600 tons, or nearly four times more.

In the trade issue of The New Orleans Times-Democrat of September last the river situation was summed up by Captain Drown, the traffic manager of a steamboat line operating from New Orleans north, as follows:

"Some years ago regular lines of large, fine steamboats plied on fixed schedules between New Orleans, St. Louis, Cincinnati, Louisville, Memphis, Vicksburg, and the lower river. This also applies to the tributary streams in Louisiana, Mississippi, and Arkansas. As the railroads opened, the patronage transferred by the shippers from the river boats to the rail lines began to have serious effect on the boats by a decided reduction in their revenue from passenger travel and freight shipments. * * * So much business was diverted from the river to rail by shippers that as the boat lines would lose a boat or one would for any reason go out of commission, the prospects for profits in building new craft were so uncertain that there was no inducement for the boatmen to replenish their fleets and keep up their trades."

However this may be, the same trade issue of the Times-Democrat shows 207 vessels belonging to the port of New Orleans, which were in service on the river and lake in July, 1900.

The St. Louis Trade and Commerce Report for 1900 shows 6 steamboat companies with 24 steamers plying between that place and other ports north and south, besides 64 independent packets and towboats.

At Memphis there is the Memphis and Cincinnati Packet Company, the Memphis and Arkansas City Packet Company, and the Lee Line of steamers running north and south therefrom.

There were 29 steamers engaged in freight and passenger business in 1899 between Cincinnati and other ports, representing a tonnage of 16,311 tons.

Notwithstanding the decline which of late years may have taken place in the river commerce, the Mississippi and its tributaries are now, as in the past, a potent factor in diminishing railroad rates and revenues. Nor must it be thought that their influence in this respect has been or is confined only to the traffic which moves between the trade centers situated on the river. The complexities and necessities which confront the railroads in rate making are such as to make this river influence almost continuous with the Rocky Mountains on the one side and the Atlantic Ocean on the other.

The recognized principle for rate construction, deduced from long, practical experience, born of strife, competition, and rate wars between rail carriers, the demands of rival markets and commercial necessities of trade centers has rendered it imperative that certain fixed relations shall be established in railroad rates to common points of destination from various points of origin.

For instance: The river, as can be readily understood, makes the rates from St. Louis to Memphis or New Orleans. The railroads running between those points, to get a share of the traffic, must necessarily offer rates approximating those made by the river craft. Chicago is not situated on the river, but it would be placed at a disadvantage as regards the Memphis or New Orleans trade if it were not put upon a relatively fair rate plane with St. Louis. A railroad company having a line running from Chicago to Memphis, or from Chicago to New Orleans may have no interest whatever in St. Louis industries, and, for this reason, might be very glad to give Chicago such rates as would enable it to compete with them. By so doing, the Chicago railroad builds up the enterprises of the town it is interested in and reaps the benefit of getting an increased traffic therefrom.

There are many outlying towns of importance contiguous to Chicago. These also have their merchants and manufacturers who are seeking markets for their wares. Demands will be made upon the railroads which serve these outlying towns for such favorable rates as will enable them to market their products as against Chicago or St. Louis. It may be to the best interest of one or more of the railroads that these demands be complied with. Rival industries and manufacturing cities farther removed, that would be affected in the sale of their products by the favorable rates given the others, would follow in making like demands upon the particular railroads which they support, with the result that relief would at once forthcome.

Then, too, railroads running from other towns situated on the rivers, such as Cairo, Paducah, Evansville, Louisville, and Cincinnati, are obliged to make rates to river points approximating those made by the boats; and inland towns, whose trade may be affected by these, make claims on the railroads which serve them for such an adjustment of their rates as will equalize their disadvantages. Thus the demand would spread, step by step, until almost the entire northern country had partaken in a measure of the low rates made necessary in the first instance by the river influence.

Nor is this all, for, taking the converse of the situation described, the rail carriers are confronted with a condition that abridges their power to uphold rates to and from the inland towns of the Southern States fully as much as in the Northern States.

Mobile is situated on the Gulf of Mexico, 140 miles east of the Mississippi River. It has railroads reaching it which have no interest in New Orleans or its commercial growth. Its merchants and manufacturers compete for trade with those of New Orleans at common markets. The representatives of the railroads running from St. Louis to Mobile say: "While we have not the competition of the river to force a reduction of the rates to Mobile, we have the fact before us that New Orleans gets low rates by river and by rail. Therefore, to enable our merchants and manufacturers to compete in common markets with the New Orleans merchants, and thereby give our roads traffic for transportation, we will be obliged to make the same rates from St. Louis to Mobile as are made by the river lines or the railroads from St. Louis to New Orleans."

Montgomery and Selma, trade centers on the Alabama River, 180 miles north-east of Mobile, compete for business in common territory with Mobile and New Orleans. They are favored with river transportation from Mobile many months in the year. Their rates, therefore, from the North can be no greater than the Mobile rates plus these low Alabama River rates. The railroads reaching Montgomery and Selma, having no interest in Mobile or New Orleans, are desirous of getting all the traffic they possibly can to and from Montgomery and Selma. This can only be done by putting them on a fair plane respecting rates with Mobile and New Orleans.

We next come to Meridian and Jackson, Miss.; Birmingham, Talladega, Gadsden, Ala., and Chattanooga, Tenn., on one side; Columbus, Rome, Atlanta, Athens, Macon, Augusta, Ga., and other towns of importance, on the other side,

all claiming from the railroads which serve them to be put on such a plane respecting rates as will enable them to do business in common territory as against New Orleans, Mobile, Montgomery, Selma, and one another.

In the same way, Galveston, 360 miles west of New Orleans, has no river advantages, but the railroads serving that city, having no interest in New Orleans deem it proper to put it on a plane whereby the Northern products can be exported therefrom and its merchants and manufacturers be enabled to compete in Northern common markets with those of New Orleans. This arrangement affects outlying and intermediate towns between Galveston and the Missouri River, and Galveston and the Mississippi River north of Vicksburg, all of which must have merited attention.

It is in this way that specific rate differentials are established between trade centers interested in effecting sales of their products in common territory. By these means, industrial enterprises, remote from the river, are enabled to trade at business centers situated on the river in competition with those on the river; and, further, inland towns, remote from the river, are enabled to interchange trade between each other at much more favorable rates than the roads would be justified in making if the river influence did not exist.

These river rates also affect the rail rates East and West, as well as those North and South. Take grain, for instance, from the Missouri River trade center, Kansas City, to New York: the rates that would apply on such traffic would have to approximate the rates from Kansas City to St. Louis plus the low barge rate from St. Louis to New Orleans. This latter was as low as 4 cents per bushel the past year. Whatever rate is made from Kansas City to the Atlantic seaboard must be made also from the other Missouri River gateways, such as St. Joseph, Leavenworth, Nebraska City, and Omaha, or else all the grain west of the Missouri River would be funneled through Kansas City.

Some of the lines traversing Missouri and Iowa have no interest in St. Louis, and to get the most remunerative haul on the traffic, are desirous of taking it through to Chicago or other Illinois junctions to be transferred to the Atlantic Seaboard lines.

The rates on traffic east of the Toronto-Buffalo-Pittsburg line, destined to the Southern States, may be affected by the ocean carriers to and from North Atlantic and Southern ports. Railroads running into the Southern States by the Virginia gateways have to measure their rates by these if they should prove to be lower than those made by the influence of the Mississippi River.

The Great Lakes, the St. Lawrence River, and the Erie Canal virtually dominate the rail-carriers' rates on traffic interchanged between the Eastern and Western States in a somewhat similar manner as the Mississippi River does traffic North and South. The rail rates are first adjusted between Chicago and New York in competition with those established by the lake and canal. Philadelphia, Baltimore, Newport News, and Norfolk make claims for less rates by reason of less distance than New York and not having as good facilities to export traffic. After much strife and destructive rate wars these claims have been allowed.

Inland towns, remote from the lakes, in Pennsylvania, Ohio, Indiana, Michigan, and Illinois, take proportionate rates with those from Chicago as their distance is greater or less than that of Chicago. This virtually means that every point in the States named enjoys the full benefit of the lake and canal competition on seaboard business. On transcontinental traffic, or that beyond the Rocky Mountains, the Atlantic and Pacific oceans have for a long time governed the rates. Rates by rail from New York to San Francisco are measured by those made by ocean steamers via the Isthmus to San Francisco. By reason of the competition of manufacturers and merchants and commercial communities between the Atlantic seaboard and the Missouri River, the Western railroads have been compelled to make the same rates to the Pacific coast from all the inland territory as are made from New York.

We might go further and say that the rates which the American railroads make from the Pacific coast points to the Atlantic seaboard on the silks and teas and other goods from China, India, and Japan are governed by the rates made via the Indian Ocean, Suez Canal, and Atlantic Ocean.

The same may be said of our cotton and cotton goods from the Southern and New England States to China, India, and Japan.

The whole question of railroad rates can be summed up in the remark that the power of the railroads to enforce any given rates is circumscribed by the water carriers, and the maximum they can charge is prescribed by the rivers, lake, and ocean carriers.

The reductions, however, in rates which the railroads are obliged to make are not at all times confined to figures forced upon them by the water carriers. Competition between railroads themselves, the necessities of trade, demands of rival

towns, and other influences have an effect in reducing the rate basis below the figures made necessary by water competition; but, as before stated, the maximum rates they can charge are governed entirely by the transportation charges made by the rivers, lake, and ocean carriers.

It is owing largely to these reasons that rates in general have been constantly on the decline. In 1868 the lake and canal rate on wheat, Chicago to New York, was 22.79 cents per bushel; in 1899, 5.65 cents. The all-rail rate in 1868 was 42.6 cents, and in 1899, 10.23 cents. In 1882 the rate on grain, St. Louis to New Orleans, by barge, was 7.5 cents per bushel; in 1900 it was 4 cents.

The average rate per ton per mile on the Illinois Central Railroad in 1873 was 2.20 cents; in 1900 it was 6.5 mills, or less than 30 per cent of what it was 27 years before.

In 1899 the average rate per ton per mile of all United States railroads was seventy-two one-hundredths cent; in 1882, 17 years before, it was 1.23 cents, or 71 per cent higher.

A comparison of the rates charged on American and foreign railways in 1892 produced the following results:

	For passengers per mile	For freight per ton per mile.
	Cents.	Cents.
United States.....	2.14	0.97
Prussia.....	2.90	1.32
Austria.....	3.05	1.50
France.....	3.36	1.59
Belgium.....	2.25	1.39

The American freight rates show by last report at hand that they are now over 25 per cent less than above figure and that the passenger rate per mile is 2.002 cents.

The English railway reports do not give the rate per ton per mile, but a publication by J. S. Jeans, of London, entitled "Railroad Problems" has this to say of English railway rates:

"English railways practically work on the same tariffs to-day they did in the infancy of the system," and "it is probable that the average ton-mile rate on English railways will not be much if any, under 14d. (3 cents), which is just three times the amount charged on the principal American lines."

Three cents per ton per mile is more than four times the rates of the American roads to-day.

The published all-rail rate of freight on grain from St. Louis to New York in 1881 was 32 cents per 100 pounds. In 1897 it was 17½ cents on corn for export. The actual rate was many times as low as 12 cents.

The New York Produce Exchange Report shows freight rates on wheat, Chicago to New York, as follows:

	Lake and canal.	Lake and rail.	All rail.
	Cts. per bu.	Cts. per bu.	Cts. per bu.
1868.....	22.79	29	42.6
1878.....	9.15	11.4	17.7
1888.....	5.93	11	14.5
1899.....	5.65	6.63	11.13
1900.....			10.23

¹ Export.

The changes in these rates, as shown, represent the action and counteraction of the river and the railroads. As before stated, the rates from other river points and interior points were influenced and affected by these reductions.

All that would now seem wanting to fully complete the Mississippi River as a vigorous and active competitor of the railways and to secure to the producers of the entire Mississippi Valley low rates for all time is a sufficient depth of water at the mouth of the river to float ships of 15,000 or 20,000 tons. If this deep water were attained, ships would be enabled to carry larger cargoes, and, as a consequence, could afford to materially reduce freight rates to foreign countries on the valley productions.

We export per annum over 2,000,000,000 pounds of provisions, 500,000,000 bushels of breadstuffs, and 7,000,000 bales of cotton. Notwithstanding the greater part of these products is raised in territory much nearer the Gulf ports than to the Atlantic ports, yet only a small percentage of them find an outlet via the Gulf ports. If larger ships could enter the Gulf ports, the ocean freight rates would be so cheapened as to permit a full share of these exports to seek those outlets. The competition that would arise from this between the railroads running to the Atlantic seaboard and those running to the Southern ports would of itself have a tendency to reduce the transportation charges millions of dollars yearly. A reduction of rates of 2 cents per 100 pounds on the export quantity of the three commodities named would amount to a saving to the producers of \$6,900,000 yearly. Any one conversant with the competitive action of railroads would not, under the new conditions which would then obtain, consider a reduction of 2 cents per hundred pounds excessive. Nor would this be all. The rates on the shipments for domestic use would be largely influenced by the reduced export rates.

It would therefore seem that a yearly expenditure sufficient to insure deep water in the mouth of the Mississippi River would be repaid more than tenfold in the benefit to the producing community that would inure therefrom.

Q. (By Mr. LITCHMAN.) You gave some statistics in relation to the decrease in the transportation of lumber to and from St. Louis, and your remarks lead me to ask whether or not the depletion of the forests in the territory tributary to the

Mississippi River has had any effect on that decrease in the shipment of lumber?—A. Yes; it has. But the decrease is largely accounted for by the doing away with the middleman. Twenty years ago Chicago was a very large lumber market. The lumber came down by ship from northern Michigan and Wisconsin and was handled in Chicago and sent out by the railroads to Illinois, Iowa, Missouri, and all through the Western prairies. To-day there is some lumber coming out, but the railroads have built into the lumber regions and the cars are loaded at the sawmills and go through to their destination, doing away with the Chicago middleman. And that seems to be the tendency in every trade.

Q. Has there been any effect from the development of the lumber industry in the South?—A. Yes. The receipts of lumber from the South to-day in Chicago are as large as the shipments of Northern pine, whereas 20 years ago there was scarcely a car of Southern pine to be found there.

Q. Do not these shipments seek other outlets as well as St. Louis? Are not shipments made at other places than St. Louis?—A. Northern Minnesota, Dubuque, Clinton, Iowa—all those points on the river have the lumber rafted down from the Wisconsin rivers in the same way that St. Louis had in the olden days.

Q. A proper analysis of your figures ought to take into consideration whatever modification there is by reason of these facts you have just stated?—A. I merely gave those facts with reference to the lumber. I did not include them in the general statement of tonnage. I gave them by themselves because it would not be fair, I suppose, to attribute the decrease entirely to the railroads.

Q. Would the same influences that would tend to decrease the river shipments of lumber also tend to decrease the shipments of the same material by railroad?—A. No; the shipments by rail would be decreased in the same way that the river shipments would be by the depletion of the forests; but the railroads might be increased by taking away from the river and going direct from the forest to the consumer.

Q. (By Mr. CLARKE.) I would like to inquire if the railroad companies have any interest in the new steel barge lines on the rivers?—A. None that I know of. Of course we are looking with a great deal of interest on this new barge line. That is the reason why I happen to know it was 54 days making the trip. We do not care about it being very much of a success.

Q. Suppose some important railroad interest acquired control of those lines, suppose, for instance, an Atlantic seaboard line acquired control of those barge lines, how would that acquisition be likely to affect the traffic of the Illinois Central Railroad, north and south?—A. That could be answered in two ways. If an Atlantic seaboard line controlled the barge lines, it might possibly advance rates on the barge line to such a degree as would make it more remunerative for the Illinois Central to haul grain by rail. But the very fact that the Illinois Central would haul the grain by rail would be a detriment to those Atlantic seaboard lines, because the Illinois Central is in competition for the grain business of Illinois, of Iowa, Missouri, and Nebraska.

Q. Take the converse of the proposition. Suppose the Illinois Central got control of those barge lines, how would that be likely to affect the traffic on the river and on the roads paralleling the river and on the Atlantic seaboard lines?—A. I suppose I can answer that by telling you what it is that influences our rates to-day. It is the rates of the Atlantic seaboard lines more than it is the river. The river comes in from time to time, but we are always obliged to meet these Atlantic seaboard lines traversing Illinois and running to the river. There are so many of them it is very hard to keep track of them and know what rates they are making.

Q. Let us carry this question a step farther. Suppose these Atlantic seaboard lines become practically operated under one policy and community of interest if not a consolidation. What effect will that be likely to have upon the course of business and on the roads?—A. A very salutary effect upon the course of business, and possibly a salutary effect upon the roads, but not such a good effect upon the rates as upon the business of the entire community, and for this reason: The trouble with the rates to-day is not in diminishing the revenues of the railways so much as it is in wiping out or exterminating business men of all kinds excepting the large enterprises that have large volumes of freight to offer and get inducements. The railroads are as much against that as they possibly can be. With these combines that you speak of bringing a number of roads under one management, as it were, or under one given policy, the first thing that would be done would be to give everyone equal rates. The small dealer and the small manufacturer could live then as well as the large one. That is the way it strikes me. The benefit to the railroads, to be sure, would come from the fact that they would not be obliged to make these reductions in rates that they are now obliged to make

by the action of some unscrupulous lines, which are not as good physically as their own and which can not get the business at the same rates; but they are there, and they have got to have the business at some rate.

Q. Suppose there should be a community of interest between the Atlantic seaboard lines and the Gulf lines, both water and rail, how might that affect some of those cities on the Gulf and on the Atlantic coast?—A. I am glad you brought that point up, because I think I would have overlooked it. It is something I have thought of. From what I say in this paper with reference to this competition of merchants and manufacturers in trade centers, I think that it would be impossible for any railroad to-day to withstand the reasonable, what I might term the legitimate, demands of any town or any community to which it runs. Of course we can not say that it would not have the power to do so, but I know that the practice is entirely different from anything of that kind. The interests of the railroad and the community are mutual but apart from that fact, if the demand is to be put upon a relatively fair plane, so that the community or the trade center will be able to do business in competition with some other trade center, it seems to me the railroad traffic officer can not resist it. Thirty years ago, in accordance with instructions received from the general freight agent of the railroad with which I was then connected, I billed a particular kind of freight, openly, at 15 cents per one hundred pounds between two given points, for one shipper and, at the same time, at 25 cents per hundred pounds for other shippers. The respective shippers knew this was being done, but I do not remember that any objections were made. It seemed to be all right then, as the party who received the lower rate shipped a hundred times larger volume than the others. I can not imagine such a thing happening to-day under any circumstances. Since then there has been a change in the way of thinking about such matters and a radical change in the way of action.

There is not a merchant who comes into a railroad traffic manager's office to day and lays down a proposition which is reasonable and logical that will not receive attention nor simply because he has the power will the traffic manager resist it. Under the conditions of the situation he can not go against what is logically right. I do not know of a railroad man whose mind runs in any other direction. I know they are charged sometimes with being arbitrary, but I speak from my experience when I say they want to be fair. I meet them all nearly every week.

Q. Then it is your belief that if the railroads can become emancipated from the slavery of ruinous cutthroat competition they will necessarily be operated upon strict business principles?—A. I have no reason to think otherwise.

Q. Suppose there is a pull from competing cities in opposite directions. To make the case concrete, take New Orleans and Boston, both export cities of grain. Assuming that the mouth of the Mississippi is deepened, as you suggest, so that the vessels of deeper draft can trade there, how would that competition be likely to affect the present grain export business of Boston?—A. It would possibly take from Boston a share of the business that it is now doing also from New York and from some of the other Atlantic ports; possibly also from Montreal. But it could not do it unless there were cheaper rates than now exist.

Q. You think, then, the present rates are rather favorable to the Eastern cities?—A. They are, by reason of the fact that the ocean carriage from the Eastern cities to European points is less than it is from the Gulf ports, made so largely by the fact that not as large ships can enter the Gulf ports as can enter the Eastern ports.

Q. Then the matter of time has something to do with it?—A. It takes possibly 50 per cent more time from the Gulf ports.

Q. Is there a considerable development of the coal industry in the Mississippi Valley as a result of the building of lines to the Gulf?—A. No; there is no export. The only development is the consumption of the towns. I think there has been very little export; possibly a little from Pensacola to the West Indies, or from Mobile. There has been none from New Orleans.

Q. A few years ago the president of the Mexican Central Railway told me that the people of Mexico imported coal from Cardiff, Wales, to Vera Cruz more cheaply than they could buy Southern coal hundreds of miles nearer, simply for the want of good rail connections between the Southern coal mines and the Gulf ports.—A. How long ago was that?

Q. Five or six years ago.—A. Well, since then there have been great improvements made. In fact, in the last 10 years there have been great improvements made in the physical conditions of railroads—the ballasting of tracks, cutting down of grades, widening of embankments, and by putting down heavier rails and adding larger and more powerful engines and larger cars—so that the cost per unit of traffic has been greatly decreased. You can readily understand that if an engine can haul 25 cars, and by cutting down grades and adding larger engines and larger

cars it can haul, say, 300 or 400 tons more, the cost of carrying this extra tonnage would be comparatively little. What the railroads can do now is entirely different, particularly the Southern roads, from what they could do 10 years ago.

Q. (By Mr. RIPLEY.) You have spoken of the competition of water routes as if it compelled a rate, we will say from Chicago or St. Louis, to a great number of points in the South. By that do you mean to imply that there are steamship lines actually plying by the Southern rivers to Montgomery, Macon, and other points? Is any large amount of traffic actually carried down the Mississippi and then up these different rivers?—A. I think there is not at the present time. It is a fact, as I have heard it said by traffic gentlemen at some of our meetings, that in the springtime, from year to year, boats do run from Mobile to Montgomery, but I was in hopes I had made it understood by my paper that, irrespective of the Alabama River being in operation from Mobile to Montgomery, the trade conditions of Montgomery are of such a character, inasmuch as the merchants were competing in common territory with New Orleans and Mobile, that Montgomery and Selma would have to get such rates as to put them on a plane with New Orleans and Mobile on account of the low rates to these points.

Q. It is not, then, the competition of routes up these rivers which determines the low rates, but competition between trade centers?—A. I think the competition of the rivers made the rates in the first place, and the differentials established at that time obtain to a large extent now. The trade centers are one influence, but there are a great many influences that make a proposition. For instance, a proposition is made at a traffic meeting by the representative of some one line for a lower rate than exists on some particular commodity from some given point on his line to a common trade center, which may also be on his line. The commercial conditions prevailing may necessitate this change in the rate. A representative of another rail line may immediately announce that if the reduction is made he will be obliged to make a corresponding reduction from a point on his line, probably a hundred or more miles away, to enable his patrons to market like commodities at the common trade center. This may be followed by propositions from representatives of half a dozen more lines, all claiming reductions to meet the new change. Various influences here insert themselves, and, after hours, and perhaps days, of contentious argument, a compromise is effected on the basis of establishing certain fixed differentials between the various shipping places and the common trade center. The result obtained supposedly enables all the lines having an interest in the business to do a fair share of it in the common territory.

Q. Is it not true that the defense set up before the Interstate Commerce Commission and the United States courts for the low rates granted to these important Southern cities has been that water competition existed?—A. I think that is true, but you understand that while there may be no competition to-day—that is to say, while there may be no business taken to-day—if the railroads were to put rates up to what you might call normal rail rates, to-morrow or the next day a boat would be in there.

Q. Suppose a boat line were started on one of those rivers, what would be the attitude of the railroads?—A. They would probably meet the rates for the time being. They do not want to see their trade taken away.

Q. Wouldn't they endeavor to crush out that competition?—A. I do not know as there is that feeling, a desire to crush out. They would protect themselves the same as they would from a rival railroad, feeling that they would not want their patrons to go to another carrier.

Q. The point I wish to make is this: Is it justifiable to assert that the rates are made by water competition when, as a matter of fact, that water competition does not exist, because the railroads have either killed it out or have power to kill it out?—A. I would answer that question by saying that railroad rates rarely ever go up, strange as it may seem to the outside public, who believe they do.

Q. You mean they do not directly advance?—A. Directly advance. This is shown from reports and from the united experience of the roads. There may be in some cases possibly a change of classification of some particular things, but I do not know when such changes have taken place.

Q. Is it not possible to advance rates by changing the classification?—A. It is.

Q. And that has been done?—A. That has been done. It was done in the East last summer, but there were also reductions made.

Q. Your statement, then, should be qualified?—A. Yes; to that extent; but when the rates have been established in the first place by this water competition they are not afterwards easily advanced. The merchants and manufacturers adjust their prices and their business operations to them, and the railroads merchants, and manufacturers of interior towns adjust their prices to these, so that afterwards, if the water competition is eliminated, it is not an easy task to advance the rail rates without a general disturbance of fixed conditions throughout a large territory. Railroads are reluctant to disturb conditions of long standing and possibly bring

upon themselves a censorious public opinion. I do not say that an advance could not be made, but I know of no case where rates have been put back to what they were formerly, or to a higher basis, simply because of the destruction of water competition.

Another reason why the rates are not advanced when this competition is eliminated may be the traffic officer has occasion to express views on these competitive rates from time to time, measures other competitive rates by them, and from long association and working traffic under them for years they finally, perhaps, become crystallized in his mind as proper figures for the traffic to which they apply. He could not readily disassociate his mind of the idea that as business was for a long period worked under such rates and the correlated conditions adjusted to them, they should still prevail when that which first enforced them no longer exists.

Q. The classification committee not controlled entirely by his road introduces changes over which he had no control?—A. Yes, but the changes can not be made on his line without his assent. When you speak of this classification having been advanced, it might be in this way: There are probably 6,000 or 7,000 articles in the classification, and they are rated, say, from 1 to 6. There are a great many articles shipped that will not come within the line of any of those classes, from 1 to 6; that is, commercially they can not stand the rates charged in the classes. They are, therefore, taken out of the classification, and are given what are called commodity rates. Those commodity rates are special rates to meet the situation, to enable those commodities to be shipped. They could not be shipped if they were charged the rates of the class to which they belong. Now, in this change in classification you speak of, the advance was by reason of the advance in price of a great many of these commodities. The railroads found that they could be relegated back to the class to which they originally belonged. That is where advances were made; at the same time there were reductions made.

Q. Can you specify any such changes made in the Southern classification?—A. That was chiefly in the official classification, and we do not use that in the West.

Q. In which classification is your road?—A. The Western classification and also the Southern.

Q. Coming back again to competition, you have spoken of the possible competition of river lines, which, however, does not exist in all cases. You acknowledge that condition, do you not, that on many of these rivers steamers are not operating at the present time?—A. Yes; but the rates which were charged at the time they were operating still govern.

Q. And you acknowledge that if steamship lines were started on those rivers the roads would, as a business proposition, have to protect themselves?—A. Yes.

Q. (By Mr. FARQUHAR.) Are there any lines that you know of on Southern rivers outside of the Mississippi and its tributaries, such as the Warrior, the Chattahoochee, etc., connecting different cities with one another?—A. The Tennessee and the Cumberland have boats running at the present time, also the Arkansas River and the Red River, I understand.

Q. (By Mr. RIPLEY.) We are referring to the rivers on the Atlantic and Gulf coasts, are there any lines regularly plying on those rivers?—A. I do not know of any; I am not in a position to know, as we have no lines east of Mobile.

Q. If you were compelled to transact all your business at the per-ton rate which you charge on your through shipment to New Orleans, could the road remain solvent?—A. No, sir. Do you mean by that that if we were to make all the rates on an average rate?

Q. If you were to make all rates on average rates, could you? Is it not true that the railroads recoup the loss on very cheaply constructed through business on the high local rates? I would like to have you explain.—A. I would like to qualify my previous statement if I conveyed the idea to you that if we carried all business at an average rate the railroad could not be operated. I was wrong there, because, if we hauled all freight at an average rate, we could get just as much money as we are getting now. The railroads would be very glad to get the average rate on everything, but the trouble is we can not get an average rate for a car of coal, for a car of lumber, nor for a car of grain. A great many of those staple commodities we can not get an average rate for, we can get an average rate for a car of merchandise. Now, your other question was with regard to—

Q. (Interrupting.) Distances; that is to say, is it not true that on the lines which operate parallel to the Mississippi the rates from the local points away from the river are very much higher than the rates from points farther distant from New Orleans, which, however, are not subject to river competition?—A. The rates from points remote from the river are higher than the rates to points on the river, necessarily. The railroads, I think, could not successfully operate their roads, particularly the Southern roads, if all rates were reduced to the basis of the rates made necessary by river competition.

Q. In other words, you are able to meet river competition at river points by making up what you lose on that traffic on increased local rates? Is that not true?—A. No; it is the old question over again. I would say it this way. The railroads at the interior points have given rates that, with the best knowledge they can bring to bear on them, are reasonable rates. Such rates enable the towns and communities to which they are offered to do business in certain territory. The railroads then come to the river. They find the situation at the river such that they can get traffic only by making a certain rate. The rate which it may be necessary to make at the river may be very low—it may be half the rate; it may be one-third of a reasonable rate for interior points—but it does not necessarily follow that by making that rate the road is losing money, which it has to recoup from the other points. A rate that will enable a railroad to add to its receipts more than to its expenses will not cause a loss of money in the sense that I understand you to use in putting the question.

Q. By losing money I mean pay all its interest on its bonded indebtedness and dividends upon a fair return of capital invested in the stock.—A. Yes; that is so; a road can not pay all fair returns on such rates, but it can add to its receipts more than to its expenses, and by reason of that fact it is enabled to give interior points better rates than it could otherwise give.

Q. In other words, this local discrimination helps, does it not, the local point as well as the competitive?—A. At the competitive point—the railroad is obliged to take the goods at the rates offered or relinquish them. By taking the goods at such rates it makes a little profit. It does not make all the profit that is necessary, but by reason of the fact that it makes a little profit, it is just so much better able to give rates to those who have not these geographical advantages.

Q. Are the steamships between Memphis and New Orleans, we will say, able to make up on higher local rates at river points for what they lose on competitive Memphis business where the railroad touches the river in the same way that the railroad is able to make up by increased local charges? To be specific, I find in the Interstate Commerce Reports, volume 8, page 121, a case involving cotton rates from Memphis to New Orleans, and the statement there made is that the rate from Memphis to New Orleans per hundred pounds of cotton is 17 cents through Holly Springs, while Holly Springs, being 45 miles nearer to New Orleans, has to pay 40 cents a hundred pounds. My question is this: Is not the railroad at an advantage over the steamship line by being able to charge those higher rates at local points, an advantage which the steamship companies do not enjoy, because there are no local points on which they can charge 40 cents in order to meet the loss of the partially lessened profit at the Memphis point, where the rate is 17 cents?—A. I think that at the way landings—such places as are not situated on the railroads—the rates are much higher than they are at points like Vicksburg and New Orleans, and that the steamboats do charge more. I would like to say in connection with the Holly Springs rate that Holly Springs, by being within 45 miles of the river, gets the advantage of the river rate of 17 cents by the river. All that the Holly Springs rate can be to New Orleans is the 17-cent rate plus the rate from Memphis to Holly Springs, and if Holly Springs were not so near the river the railroads, instead of charging 40 cents, would be obliged, and from the revenues and the interests paid by the Southern railroads would be justified, in charging more than 40 cents. So far as the Southern roads are concerned, the last report of the Interstate Commerce Commission shows that while the roads south of the Potomac and the Ohio rivers and east of the Mississippi River have 17 per cent of the mileage, their earnings have been only 12.5 per cent and that—I have the figures exact—they only paid 6 per cent of the entire dividends paid by all the railroads of the United States, where their share ought to be 17 per cent. They had some \$782,000,000 capital and bonds upon which nothing was paid.

Q. Understand me, I am not criticising this practice at all. It seems to be a necessity of the business, but a witness before this commission, who represented the steamship companies, has testified that, as a matter of fact, in the competition between waterways and railroads it was not the waterway which made the rate, but the railroad. In other words, that the Illinois Central makes the rate which the steamers have got to meet, rather than that the steamer makes the rates which restricts charges of the Illinois Central.—A. I have no doubt that is so eventually. It must be so. As I stated, the present rates are the result of action and counter-action on the part of the steamboats and the railroads.

Q. He testified that it is the steamship companies that suffer by competition rather than the railroad which was underbid. He testified that from the local points—we will say between Memphis and New Orleans—on the river that there was no way of recouping by higher rates; that nobody could expect that at any point, and that consequently to a point two-thirds the way up to New Orleans from Memphis the rate would be approximately two thirds of that Memphis rate—17 cents;

so that the steamer company is getting from a point two-thirds the way from Memphis two-thirds of 17 cents, whereas the Illinois Central from a point within the line is getting 40 cents, and that consequently the railroad has a great advantage over the steamship company, and that it is the railroads which have driven the steamers out of existence.—A. I do not understand the steamboats would charge two-thirds of the rate to a point simply because it was two-thirds of the distance. They generally have a blanket rate, and while the rate is 17 cents from Memphis, where they could load boats, down farther, they charge \$1 a bale, which would be 20 cents a hundred.

Q. (By Mr. FARQUHAR.) Can you give the difference in your operating expenses from Chicago to Cairo and from Cairo to New Orleans?—A. That is not a part of my business; I do not think the accounts are kept. There is no division of the operating expense.

Q. Have you any idea what the difference in the volume of traffic is?—A. I made a statement some years ago before the Interstate Commission, and I think I showed that on Northern lines—the lines north of Cairo—the ton miles to the miles of line were four times North what they were South.

Q. (By Mr. RIPLEY.) You have spoken at length of the great decrease in freight rates in the last 30 years. Your statistics, however, almost entirely dealt with through rates, did they not?—A. The statistics dealt with through rates, but the statement that I have given here includes all rates—that is, the rate per ton per mile.

Q. Would you be willing to say that there has been a corresponding reduction of local rates upon the railroads of the United States as a whole of which you have any knowledge?—A. No. I do not think there would be a corresponding reduction.

Q. Has there been any reduction?—A. Oh, yes; from time to time.

Q. On the Illinois Central, with which you are familiar, can you state any specific instance in which local rates are less than they were 20 years ago?—A. Yes; our rates on cotton have been revised, I think, two or three times, and there were reductions in merchandise on Southern lines. The rates in Iowa and other States have been revised.

Q. And these have involved a substantial reduction of the local rates to which we refer specifically?—A. Yes, because they have distance tariffs on all classes of commodities in various States.

Q. The point I wish to inquire about is this: Does not that excessive reduction of through rates to which you refer entail a burden on the railroads? Are they not doing business at less than they could afford to do that same business were they not able to make some added profit from local rates; that is to say, including the interest on the capital invested? Do I make the question clear?—A. If the railroads did not take this competitive business at these low rates they would lose so much revenue: for instance, say it was 10 cents a hundred, and that they were obliged to charge 20 cents from local places, they are obliged to take the through freight at the 10-cent rate or not take it at all. By taking it at 10 cents there is not a loss. They can not, to be sure, pay the pro rata of interest upon bonds and stock and other things, but they do add something to their receipts more than the amount they pay out. I would put it this way: I will divide the whole expense of the railroad up into three parts, and I will say that one part, or one third, is interest on stock and bonds; I will say that another third is the fixed expense of maintenance of stations and station grounds, salaries of the general officers, legal officers, division officers, station agents, clerks, telegraph operators, bridgemen, section-road men, and all that class which it is necessary to retain, whether the competitive business is or is not taken. We have in these two thirds of the entire expense, which might be termed a "fixed expense" that goes on whether we haul 10,000,000 or 20,000,000 tons. We have another expense, the other third, that I will term the "movement expense." This consists of the wages of engineers, firemen, conductors, and brakemen, the locomotive and car repairs, fuel, oil, waste, water, and wear and tear of rails and track. In the operation of the railroads of the United States, the average expense of these three respective divisions of the service will approximate the proportions given. As competitive traffic is offered at certain specified rates made for us by influences beyond our power to control, change or affect, the question to be first determined is will it pay this "movement expense." The other two-thirds expense goes on whether we take it or relinquish it. Any amount in excess of this "movement expense" that can be obtained is just so much more that can be applied toward meeting the fixed two-thirds expense and thereby enables us to make the burden so much lighter for the local or noncompetitive traffic. As before stated, the expense attendant upon the transportation of competitive freight which a railroad can secure only on condition that it charges certain specified rates made for it by outside influences

entirely beyond its power to control, change, or affect, is the actual outlay which its movement necessitates. If the railroad plant and other facilities are ample to enable it to transport such freight without further outlays, then it will be seen that the expense incurred will not be in proportion to that of its regularly established business. Nor will the movement of competitive freight always incur the entire expense embraced in the several items named comprising the "movement expense."

The "movement expense" of such traffic might be decreased considerably, according to the different conditions or exigencies that might present themselves. For instance, if the traffic were offered at a time when empty cars had to be returned, the item of wages, fuel, and other supplies, together with repairs of locomotives and cars, would not properly enter into the cost. The expense incident to these would be largely incurred with the movement of empty cars as well as with loaded. Then, again, if the preponderance of tonnage was in the direction opposite that to which the competitive business was destined and such business enabled the carrier to load up trains that would otherwise be half empty, the expense of the new competitive business would be inappreciable. Neither would this competitive business entail a proportionate share of the large expense of maintenance of track, bridges, and culverts, which constitutes a large part of this one-third "movement expense." The wear and tear of these are not in direct ratio to the tonnage transported. The wear and deterioration caused by the action of the weather, the repairs, renewals, and cuttings of embankments, of the masonry, ballast, and road crossings, the disintegration of ties, bridges, and fences would go on just the same whether this competitive business was or was not hauled, so that it would not be proper to charge such extra business with a tonnage proportion of the expense of their maintenance.

Keeping in view these many influences, it will be observed that many of the items comprising the "movement expense" already incurred by the then existing business would not be changed by the addition of the new competitive traffic and that the entire expense of its movement would in many cases be inappreciable.

From what I have said, it will be seen that the difference in a rail-carrier's rates can sometimes be very great, and yet it can not justly be affirmed of them that some are unreasonably high or others unreasonably low; that the expense which a traffic under certain conditions adds to the already existing expense of a railroad may be covered by very low rates without injury to any community or locality, and yet the rates which it may be necessary to charge upon other traffic must of necessity be higher in order that the entire cost may be covered and the property be safely and successfully operated. Any profit, therefore, there may be in the transportation of a competitive traffic—and from what has been said as to the expense, I think it will be conceded the rates would have to be exceedingly low before there was no profit—relieves the local or domestic traffic of so much of the burden of meeting the fixed steady expense, and that so long as the receipts from this competitive traffic are in excess of the expense incurred for its transportation, there can be no such thing as recouping loss on low-rate competitive business by charging higher rates on local traffic, no matter how large a difference there may be between the two rates.

Q. Suppose that this competition which has brought the rates on through business, the shipment of grain to the seacoast, down distinctly to the level and almost to the cost of moving, will not the elimination of that competition by community of interest in some way, perhaps, have a beneficial result in preventing the further progress of that decrease in rates which is a loss to the railroad, if you put all expenses together?—A. It might do that. It might prevent this gradual decrease in rates that you speak of, but the things that have operated in the past largely to reduce these rates, the rivalry of towns that may be situated on different roads, and the necessities of commercial communities will continue to operate. Manufacturers will come on one road and they will compete with manufacturers probably three or four hundred miles away to get into a common market. They may not be able to get the raw product as cheaply as their competitors, and this disadvantage will have to be equalized in some such way as by a reduction in rates. So it seems to me that the railroads that serve particular communities—trade centers—can not resist the demand for putting those people on a plane whereby they will be enabled to do business, to build them up, build up the railroads, and build up the towns.

Q. Is there any community of interest going to be powerful enough to prevent that recognition of trade centers?—A. I do not think it can run against the public opinion or the necessary demands that would be made.

Q. Does not that trade competition between centers consist in the giving of special commodity rates, rebates, and other acts of discrimination which are not

granted to certain individuals but to towns?—A. I think there is very little of that. The practice was in vogue before the interstate law went into effect. They did have special rates from special towns to certain territory—that is, from large jobbing centers—but all the merchants had those rates from those towns. I do not know that it is in operation now.

Q. You are familiar with the basing-point system of Southern States?—A. Yes.

Q. What determines whether a particular town shall be a basing point or not? Will you explain that system, for the sake of the record?—A. It virtually is about the same as I have stated in my paper, that the minute a town has grown to any importance, and it has got a certain number of jobbers that can trade in the outlying districts, then it gets rates that are related to rates made other jobbing centers. These would start, say, for instance, from a point like Atlanta, or like New Orleans, and gradually extend to other towns that were of sufficient commercial importance to justify them in receiving as good rates as the others. The rates are not always the same to the different points, but their relations to each other are such as to enable each place to trade in the outlying territory that might be claimed as naturally tributary to it.

Q. What determines whether a place shall be a basing point or not? Is it not in some degree arbitrary?—A. It is arbitrary, but the place must have some jobbers; that is, what we call jobbers—some wholesale houses that trade in the outlying districts.

Q. It involves an infraction of, or an exemption from, the long and short haul clause of the Interstate Commerce Commission, does it not?—A. It does.

Q. Do these basing points exist at all in the territory in which the Illinois Central Railroad serves, or does that railroad observe the long and short haul clause?—A. The Illinois Central observes the long and short haul clause, with, however, some exceptions, like Jackson, Miss., and a few other points.

Q. Could it be possible for any other jobbing centers to rise in competition with Jackson, Miss., so long as you dropped these basing-point rates to that center?—A. Basing-point rates were there before the interstate law was put in effect, and we base the rates now on river rates to Vicksburg plus the rail rates. Basing point rates at Jackson, in the first place, arose from the Vicksburg river competition. In the second place the rates at Meridian, a competitor of Jackson situated on other railroads some 90 miles away, makes the practice necessary at Jackson.

Q. Can you meet competition from New York jobbers in the Mississippi Valley territory by rates which are granted Chicago jobbers in that same territory?—A. The rates from both places are related. We can not change a rate a day from the West without demand being made for reduction in the New York rate.

Q. Is there any complaint on the part of trade centers in the Middle West—Chicago, St. Louis, and other places—that they are unable to compete with New York in the Mississippi Valley territory?—A. In the Southeast we give a certain territory the name Mississippi Valley. While the section is all Mississippi Valley, that east of the Mobile and Ohio railroad, which is about 100 miles east of the Mississippi, is especially so in our nomenclature. The Illinois Central has full and complete control of that section and makes such rates from Chicago and from other points as will enable those people to go into that Mississippi Valley territory. There is trouble, however, on territory east of that, as you say.

Q. Might there not be a line along the junction of those two territories where competition from New York as a trade center on one side and competition from Chicago and St. Louis on the other side would especially depress rates and give a peculiar advantage to, we will say, Montgomery?—A. The rates were very early fixed from Baltimore, on the one hand, and Cincinnati, Louisville, and St. Louis, on the other. The matter has come up three or four times in the last 10 years, and it has been shown that the effort of the West was to put in the products from its manufactures as against the East, and changes are made from time to time. Every meeting you will find a list of changes, making rates one way or another to meet the new conditions.

Q. Are you aware of the recent experiment described in the press, inaugurated by the Chamber of Commerce of Chattanooga, or by the merchants of Chattanooga, chartering a steamer to ply down the Tennessee River to Paducah, in order to prevent excessive rates, excessive to that center?—A. I have seen a statement to that effect. There are boats running on that river all the year round.

Q. There is nothing in the nature of innovation, then, in this experiment?—A. Probably coming up as far as Chattanooga, there is; but Chattanooga has been able to get lower rates than it would otherwise get by reason of the competition of Nashville.

Q. The statement is made by the press that by shipping by water from Chattanooga to Paducah a saving of 30 to 40 per cent on through shipments to New York

and Philadelphia is effected. Can you explain that further?—A. No. I should think that would be an excessive saving.

Q. It might result in a considerable saving, though, under such conditions as are familiar to you?—A. Yes; but I think they have boats up to Nashville, and the rates from Nashville to Chattanooga plus boat rates to Nashville of course can not be as great as though they had only rail transportation to Chattanooga all the way. It would be only in some special commodities, I think, where the saving would be effected. There is grain, flour, and other articles.

Q. In the territory served by the Illinois Central is there a tendency at the present time toward the extension of the system of floating rates on cotton?—A. There is.

Q. Will you speak upon that topic and show what its effect upon the railroad is—the cotton business?—A. In general, its effect has largely done away with the middlemen, and has effected a saving to the producer of from possibly \$1 to \$3 per bale. The conditions governing the handling of cotton and its transportation to Eastern factories have greatly changed in recent years. Formerly the cotton factor at New Orleans or Memphis advanced money to the producer for supplies, stock, wagons, and other material entering into the production of the crop. Interest and commissions were charged for the money, and, in addition, the planter was obliged to ship to the cotton factor 10 bales of cotton for every hundred dollars advanced. In addition to the interest charges, the producer of the cotton was subjected to excessive prices for the handling of the cotton at New Orleans and Memphis. Besides the interest and commission charges, there were charges for brokerage, storage, insurance, sampling, classifying, marking, weighing, packing, compressing, drying, watching, handling, stowing and screwing. These various labors were under the guidance of associations, and the result was the producer was left with very little, if any, profit.

In recent years compresses have been located in the interior towns, banks, and other facilities have been established, through bills of lading are issued, all of which supply the interior merchant and the producer with requisite means to carry on the business. Buyers from the Eastern mills can now make their selections from the interior towns and ship direct to better advantage both to mills and the producer, than formerly. Floating cotton, as it is termed, is cotton shipped from a town where there is no compress and stopped in transit at a town where there is a compress and where it is then compressed, classified and afterwards reloaded for destination. By floating into the compress small lots from various towns, purchasers are enabled to ship full carloads of different classes of cotton to various destinations.

Q. Is cotton bought direct for the Southern mills in the same way, as a rule?—A. I think it is very little bought on our line for Southern mills, but I think that where it is, it is bought in the same way as for the New England mills.

Q. What is going to be the effect of the extension of this system of floating cotton on former cotton centers, such as Memphis and other cities?—A. I think it will gradually take cotton away from these centers: the planters will ship direct. They get as good prices now at the station as they did formerly at Memphis or New Orleans, and they had to pay freight, aside from storage, insurance, sampling, and commissions.

Q. Is there not difficulty in this cotton traffic or in the general traffic of the Illinois Central by reason of the lack of balance north and south bound tonnage? Does this increase the cost on Southern roads, as a whole?—A. Of course, if the tonnage was equalized, the cost would be decreased in both directions.

Q. How far is it unequal? Can you make any statement respecting the proportion of north-bound and south-bound tonnage on the Illinois Central, for instance?—A. I think the last report I saw showed it to be very nearly equal; but even though it were equal for a year, it necessitates a large lot of empty cars being hauled each way. That would arise in this way: Take, for instance, the country in and around Chicago for 200 miles where the traffic moves. The merchant must have his goods on his shelves along in February or March. That will necessitate their being moved from New York or from the East probably in February, and from Chicago soon after. When the farmer comes into the country towns with grain for sale after he has done his seeding, the goods he wishes to purchase must be in the merchant's store. The railroad has already brought them there, and as the farmer was not then ready to market his products, the railroad had to return the cars empty for more merchants' goods. When the farmer is ready to market his products the greater part of the merchants' wares have been already hauled, so that empty cars will have to be hauled to the farmer for the transportation of his products; so that while the tonnage might be as great north as south, or nearly equal each way, still empty cars might have to be hauled in each direction by reason of the tonnage movement not being contemporaneous.

Q. As a rule, do the Southern roads operate under more or less disadvantage in this respect compared with the Official and Western territory?—A. They operate under greater disadvantage.

Q. That circumstance would justify a higher rate per ton per mile, would it not?—A. Yes. Then, the fact that they have not the tonnage per mile of road means that they have not the earnings per mile of road.

Q. Is there a tendency toward an increase in the distinction between carload and less than carload rates on Southern roads?—A. I think not. They sometimes charge the same, and sometimes have a carload rate, which is less than carload rates.

Q. Is that not determined by the Southern classification committee?—A. I do not know; we have rates for less than carload lots.

Q. Are you not subject to the Southern classification of shipments in there?—A. We are independent; we make any rule we want to establish, but we have a carload rate which is just, and also less than carload rates.

Q. I do not understand how you are independent. I supposed every railroad operating in the territory east of the Mississippi and south of the Ohio was subject to uniform classification for that territory.—A. If all agreed upon a classification I suppose that would be true, but I know we have these rates. I am not very well acquainted with classification matters. Some of the other subordinate officers attend to this, but I think that the lines within a hundred miles of the Mississippi River have carload and less than carload rates.

Q. Have they always had that distinction?—A. I do not know that all have.

Q. Has your road?—A. Our road has, as far back as 1883.

Q. Do you make more or less distinction at the present time as compared with 20 years ago?—A. I could not say as to that; I would say more, if any.

Q. What would be the effect of greater discrimination?—A. To increase the carload business.

Q. What would be the effect of that on the small shipper?—A. He would be enabled to get carloads at cheaper rates than he would be otherwise.

Q. Suppose he could not handle a carload?—A. The object in decreasing the carload rate would be to enable him to handle it.

Q. What is the present status of the litigation between the Mississippi Railroad Commission and the Illinois Central Railroad respecting the land of the Yazoo and Mississippi Valley line? Was there not opposition by the railroad commission to the acquisition of that land on the ground that the statute forbade consolidation of competing lines?—A. I do not know anything about that. The Yazoo and Mississippi Valley Railroad is a distinct organization entirely from the Illinois Central.

Q. It is controlled by the Illinois Central, is it not?—A. The officers of the two lines are identical. There is no litigation pending, I think.

Q. (By Mr. FARQUHAR.) Within the last two or three years have you found competition in the carrying of grain between, say, Kansas City and Galveston and the Mississippi River and your road?—A. Yes.

Q. Have you ever been able to compete with that further Western rate—the Galveston rate?—A. Yes; we are doing it all along. The rates from Kansas City to Galveston and New Orleans are made with relation to the rates from Kansas City to St. Louis plus the barge line and from Illinois territory to New Orleans via all rail.

Q. You spoke of the railroads making the rates always within a paying margin; did the railway men at the time the Kansas City and Galveston rates were made think that was a paying rate—the cut rate to get through?—A. There was one time that the Kansas City Southern road made low rates. The Illinois Central has never had very low rates. We have gone out of business a good many times by reason of low rates; that is, we did not give our shippers the rates which they said were necessary for them to have in order to enable them to ship as against other territory.

Q. Do you regard this steel-barge line on the Mississippi as an experiment, or are there business reasons for believing they will hold their ground?—A. I think the owners went into it with that intention. It is on the new plan of McDougal. He is the fellow who built the whaleback. They, however, are confined at present to two barges. I suppose for the purpose of seeing how they will come out.

Q. Is it a fact that the old barge lines of the '80's really paid, or were they abandoned because the railroads cut rates on them or lessened the rates so that they could not pay?—A. I do not think they paid.

Q. Was that original barge line, as far as you know as a railroad man, started to cut Eastern rates and thus bring Eastern roads to terms?—A. I think it was started in the interest of the Missouri Pacific, which had no interest whatever east

of the Mississippi River. It was known at the time, as I recollect, as the Gould interest.

Q. You spoke of the transcontinental rates on silks, teas, etc., saying that tonnage coming this way was controlled considerably by rates of the Suez Canal and the Indian Ocean. Is it not a fact that the Canadian Pacific made the rates for the transcontinental roads?—A. The Canadian Pacific could make them, but the Canadian Pacific would be subject to the same reasons why they should have good rates as any of the other transcontinental lines in competition with the Canadian Pacific. Any road in order to get its share of the business may move particular rates down, but wars can not last forever. Then they have to have these understandings in regard to what rates they will make, and when they come to that condition the maximum they can charge is what they can get by measuring it with such rates as are made by the Indian Ocean and the Suez Canal.

Q. What control has the Interstate Commerce Commission over Canadian Pacific roads?—A. No control.

Q. Don't Canadian Pacific lines recognize that they are subject to the jurisdiction of the interstate-commerce law and the Interstate Commerce Commission?—A. When they run into the United States I think they have acknowledged the jurisdiction, but there is nothing to prevent their giving a portion of the revenue which accrues on the Canadian lines to shippers, if they see fit to do so.

Q. (By Mr. RIPLEY.) Do you deliver any traffic to the Canadian Pacific road at Chicago?—A. The Canadian Pacific does not run into Chicago.

Q. Does it not control a line which operates into Chicago?—A. I think not.

Q. (By Mr. CLARKE.) Traffic from your road to the Canadian Pacific is made by way of the Wabash, is it not?—A. I suppose it would be; or possibly by the Michigan Central.

Q. (By Mr. RIPLEY.) Is there any large amount of cotton shipped all rail to Boston for export?—A. Yes.

Q. How would the rates, let us say, from New Orleans or Memphis to Liverpool through Boston, compare with the all-water rates from New Orleans or Memphis to Liverpool?—A. The rates would be the same to Liverpool via Boston and from every other port all the way around to New Orleans.

Q. The proportion, however, which the railroads in American territory would receive would be fixed on that same basis?—A. It would vary according to the rate offered.

Q. Which is the variable rate, the rail rate or the water rate, in the combined traffic?—A. They both vary. The rates to-day from Memphis to Boston, New York, Philadelphia, Baltimore, Norfolk, Charleston, Savannah, Pensacola, Mobile, and New Orleans are all fixed figures. Each one of those ports reports each day what ocean rates they can obtain to Liverpool on cotton.

Q. To whom do they report?—A. To a central man in Memphis.

Q. Can you give his name and address?—A. It is under-on—J. A. Anderson, I think. He is secretary of the Memphis cotton committee. Those ocean rates from the various ports are added to those fixed rail rates. The port which has the lowest rate to Liverpool fixes the rate for all ports. On the supposition that the ocean steamers take the rates which they offer in that section, the railroads have to shrink their rail proportion down to a figure that will enable them to make the same through rate as is made through the lowest port. That is the only way they have found whereby all lines could get a share of the cotton and at the same rates.

(Testimony closed.)

WASHINGTON, D. C., May 14, 1901.

TESTIMONY OF MR. WILLIAM LEGGETT GUILLAUDEU

President of the Old Dominion Steamship Company.

The commission met at 2 o'clock p. m., pursuant to recess, Chairman Kyle presiding. At that time Mr. William L. Guillaudeu, of New York City, president of the Old Dominion Steamship Company, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Senator KYLE.) Please state your full name, address, and business.—A. My name is William L. Guillaudeu; my residence is New York City; office address, 81-85 Beach street; I am president of the Old Dominion Steamship Company.

Q. You may state, Mr. Guillaume, something in regard to your own company—its organization, where it operates, what class of freight or freights is handled, and also whether you carry passengers.—A. The Old Dominion Steamship Company was organized under the laws of the State of Delaware in 1875. It operates lines of freight and passenger steamers. Its main line is that from New York to Norfolk, Portsmouth, Pinner's Point, Newport News, and Richmond, Va. It has subsidiary lines to many small points in the Chesapeake Bay country, likewise subsidiary lines on the North Carolina sounds and rivers. It has intimate connections, both freight and passenger, with all the great railroad lines operating out of the Virginia ports, chiefly the Norfolk and Western, the Seaboard Air Line, the Atlantic Coast Line, the Southern Railway, the Chesapeake and Ohio Railway, the Norfolk and Southern Railway, and smaller steam and rail lines. The great bulk of its business on the main line is freight, with, however, a large passenger business.

Q. What number of steamers do you run?—A. We operate 6 ocean steamers, 12 subsidiary steamers of a sound, bay, and river character, and between 35 and 40 harbor craft—lighters, barges, steam transfers, and steam tugs.

Q. Is this company organized to operate in conjunction with railways?—A. Only incidentally.

Q. Or to piece out their terminals into New York City?—A. No: it is operated as a water transportation line primarily, and that is its purpose. Its railroad alliances are incidental to the growth of the business.

Q. Were the original incorporators railway men, as a rule?—A. Not active railway men, in any sense; no.

Q. Are they now?—A. Some of them; yes.

Q. Identified with what railways, chiefly?—A. The chairman of the board of directors of the Norfolk and Western Railroad, the president of the Seaboard Air Line Railway, the president of the Southern Railway are on our board of directors, those lines having stock interests in our company.

Q. (By Mr. RIPLEY.) How long has this railroad interest in your directorate existed?—A. Fully 20 years.

Q. Since the organization of the company?—A. Not quite. Something over 20 years ago. It was felt that it would strengthen the company to have the principal railroads with which it was then connected and doing its business interested in the company, and that was brought about, and that interest has been held continuously by two of the lines. There was also a third interest at that time which has since been transferred to the Southern Railway.

Q. Are there any independent water lines which have no affiliation with the railroads operating in the Chesapeake Bay and up to New York, for instance?—A. The word "affiliation;" how broad do you mean to make it?

Q. I mean community of ownership, if you please, or actual representation on the board of directors.—A. My understanding is that there are several of the coast lines, notably the Merchants and Miners' Company, the Mallory Company, and the Clyde Line—which I think have no absolute railroad ownership, but they have a large affiliation in the sense that a very large proportion of their business is in connection with railroads and they have close working and traffic alliances with the roads.

Q. Is your policy the same as theirs in the making of rates?—A. On through business, I think so.

Q. You are members, are you not, of the Associated Railways of Virginia and the Carolinas?—A. No; not of that organization. I think no water line is. But we are members of what I might call the wider organization, the Southeastern Freight Association.

Q. Of which Mr. S. F. Parrott is chairman, with headquarters at Atlanta?—A. Yes.

Q. What is the function of that Southeastern Freight Association as far as the making of rates is concerned? Do they prescribe the rates which you shall charge?—A. No: It is a common bureau through which the rates used in common—that is, by all lines participating in competitive business—issue. They subscribe to the expenses of it. It is a joint office, without powers, however, of fixing rates.

Q. Do you agree to accept the rates which they fix, or have you power to make an independent rate?—A. Absolutely no rate can be fixed for us that we do not fix ourselves.

Q. You however find it for your interest not to be too independent, do you not? That is to say, you strive to preserve harmony between the different lines interested?—A. I think all business arrangements are a matter of concession, of give and take. You will understand that the Old Dominion Steamship Company is directly represented by its traffic officers on all matters which have to do with considering rate matters, and they decide themselves.

Q. (By Mr. PHILLIPS.) About what per cent of the capital stock of your line is owned by the railroads or railroad people?—A. The total ownership by the three interests, I have stated, is more than a majority of the stock.

Q. That is owned by railroads?—A. Yes.

Q. (By Mr. RIPLEY.) Do we understand you to state that you do not know whether there are any other competing lines in the same situation with reference to the railroads—that is, that the others are all independent lines?—A. No; I understood your question to mean were there any outside.

Q. Are there any others that are controlled by the railroads?—A. There are several lines on the coast in which, according to common report, the railroads have an interest, notably the Ocean Steamship Company of Savannah, and the Cromwell and Morgan lines to New Orleans. I think the Chesapeake Bay lines are largely owned by the railroads. I think most of the Eastern lines from New York, running east, are owned by railroads.

Q. Is there, then, any real competition between the steamship and railroad lines along the Eastern coast? Will you explain what the situation is in that respect?—A. There is genuine competition, I should say, between the steamships and the North and South railroads running up and down the coast, to the coast points proper, as between New York and Norfolk and Richmond, New York and Wilmington, New York and Charleston, New York and Savannah, New York and Brunswick, New York and Jacksonville, there is genuine competition. On business through those ports to the interior, I think the competition is more relative to the several interests as between the water lines and their rail connections to the ultimate point in the interior.

Q. In other words it becomes a question of competition between all-rail lines and rail and water lines combined?—A. Yes; that is very well said.

Q. In such a case we will say there is competition to Atlanta—would that be a fair illustration?—A. Yes, certainly; Atlanta is practically the Chicago of the South.

Q. When rates all rail and rail and water are made together, is there any allowance made in the nature of a differential to the water lines or to the rail and water lines combined?—A. Yes.

Q. Will you state the principle on which that allowance is figured?—A. The theory is that the water route (the combined water and rail route) has certain disabilities, the most important of which is the leakage of bulk at the point of transfer; secondly, the marine risks and dangers of damage and loss, and third, the infrequency of sailing, the longer intervals between movement as against all-rail lines. Those I consider are the three most important elements which have seemed to require, and have so worked out, a lower rate on the part of the rail and water lines.

Q. Do these objections or disabilities apply equally to all kinds of freight? That is to say, as a rail and water line combined, are you peculiarly hampered in certain kinds of business as compared with others?—A. Yes; we are absolutely out of certain kinds of business notwithstanding our lower rate, notably in the enormous movement of cotton mill machinery. In all this great development of the Southern cotton mills, the transportation of much of the machinery which is made in the East has been lost by the coast lines, practically all of it, because of its delicate character. And there is other business perhaps of that character where the same thing applies, the rail movement is so much superior. The unbroken car which the manufacturer loads right at his foundry door and mill door and which goes to the ultimate point of destination, even to the very entrance door of the enterprise, offers inducements which the steamer can not hope to equal.

Q. Is there any distinction made in making up rates as to the different classes of commodities, as to whether these commodities are really in the competitive class or whether they are of a character which boats would not carry in any instance? Or is there one principle adopted, namely, of granting a differential to the rail and water lines as compared with the all-rail lines? Is the principle applied equally to all kinds of business?—A. The principle is of almost universal application. The modification of it comes in the scale of the difference; if I may say so, the rate of the difference. To a certain extent, however, the position is an average one. In no case, I might say, is the differential made wide enough to absolutely attract a certain commodity because of the differential. It is made an average which gives a fair result to the shipper.

Q. What is the amount of the differential, for instance, as between New York and Richmond, can you specifically say, on first, second, and other class goods?—A. The differential between New York and Richmond as enjoyed by our line against the railroad carrier is 5 cents, first class, and 1 or 2 cents sixth class. I may have to refresh my memory as to that.

Q. What are the rates first class, for instance, in cents per 100 pounds?—A. My recollection is that the railroad rate is 33 cents per 100 pounds, first class; our rate is 28 cents.

Q. From New York to Richmond?—A. From New York to Richmond.

Q. Is there any such differential between New York and Norfolk?—A. No.

Q. Complaint has been voiced from Richmond to this commission that it does not enjoy the same rates either by all rail or rail and water that are accorded to Norfolk. Will you explain to the commission why in the one case the privilege is given and in the other denied? I wish you would give the rates and information with respect to the way in which rates are made, either from the West over your line up to the North or in the opposite direction?—A. I think that the origin of that difference was the old steamer scale of rates. The New York and Philadelphia steamers, for instance, reaching Richmond touched at Norfolk and went on some 120 miles up the James River to Richmond. Their rates for carrying freight have been for many years—10 years, I suppose, as long as steamers have run there—higher to Richmond than the rates to Norfolk. Some years ago it became the policy of our company, because of the distributing competition between the two cities, to make the rates the same. My recollection is that the rail rates from the Northern cities have never been the same by the different sets of carriers between northern points and Richmond and northern points and Norfolk. I may say, I think it is the continuation of the original basis which was originated by the steamer lines.

Q. Does it seem to you that the complaint of Richmond is in any way justified by the conditions, Richmond and Norfolk being competitive centers? Let me ask another question: Does the existence of competition by the Cape Charles route to Norfolk have anything to do with the matter?—A. No, I think not. I think it can be fairly claimed that it is the absolute influence of the proximity to the sea which would always, perhaps, make a lower rate to Norfolk than to Richmond on the merits of the case—on the merits of carriage or service performed.

Q. What is the system of prorating, we will say, on a shipment over your line to or from Memphis or to or from Atlanta?—A. The basis is the distance carried by each link in the line.

Q. Not absolute distance, however, by water?—A. No, there comes in a scale or an equalization—so much water distance to so much rail distance.

Q. What is the constructive mileage that is prorated on through business via Norfolk?—A. Our line adopts a uniform basis of 160 miles.

Q. What is the actual distance?—A. Three hundred and twenty-three. It was called 320 miles in the old days. It was an estimate of two for one.

Q. The assumption, then, made in prorating is that the expense of water carriage is, for an equal distance, about half that of all-rail carriage?—A. Yes; I think that scale was fixed or worked out by the longer water lines. It is common on the coast. I think I am right in saying that the other Atlantic coast lines use that basis of two for one.

Q. Is there any feeling on the part of either the railroads or the steamboats that this prorating distribution is perhaps not altogether fair to both parties under the present costs of operation?—A. Yes; and it has been in our case recognized by the allowance for extraordinary terminal and handling expenses; so that, while our prorating distance has not been changed, there has been an acknowledgment that on so short a route it is not equitable. Hence we allowed, further than that, a terminal of so many cents a hundred pounds, and this applies through a very wide range of country.

Q. In prorating, do you make any distinction between the cost from New York to Norfolk or Richmond for local consumption and the cost from New York to Norfolk or Richmond through to points beyond?—A. What is the first of your question?

Q. In other words, do you apply the principle of the import or export rate on coastwise business, and is it the custom with other steamship companies?—A. Yes; the proportion of distance carried fixes the percentage, and we accept that percentage, wherever it may lead, on our through business.

Q. What is the rate to-day from New York to Richmond, first class, as you have said?—A. Twenty-eight cents.

Q. Twenty-eight cents by your route; that is, from New York to Richmond, for consumption at Richmond—terminating at Richmond?—A. Yes.

Q. What would be your proportion of the through charge to Atlanta, passing through Norfolk or passing through Richmond?—A. I have not the figures in mind, and I do not know exactly, but it would work out in cents per 100 pounds, with all the elements at that point, probably pretty nearly as much.

Q. And still you do recognize a certain difference, do you not, on the same principle adopted in making import or export rates by the trunk lines?—A. We are bound to. Some of the roads, theoretically, in the old days would, in making up a rate, adopt our rate to Norfolk, and perhaps the next carrier's rate to the next junction point, and so on, and the sum of all would make the total rate. Now, all the elements come in which serve to make that rate by our line, and whereas our rate to Atlanta is one thing, it would be another to another point.

Q. Are you a competitor in rate making with the other coastwise lines which ply to Savannah; for instance, on Atlanta business, they prorating through with the railroad connection and you prorating at Norfolk with a railroad connection of your own?—A. Yes.

Q. There is direct competition between the several steamship lines and by the railroads?—A. Yes; there is all through, generally.

Q. Your own line has its own soliciting agents distinct from the railroads?—A. Yes; and the through lines have as well. We have through-line machinery.

Q. What do you mean by that?—A. I mean that the business, for instance, over the Southern Railway from New York to Atlanta is done under an organization known as the Piedmont Air Line, a certain organization that has a trade-mark and has its agents in New York, Boston, and everywhere; it has traveling men at work for that line.

Q. And you are a member of that line?—A. We are a member of that line, and we have to pay our quota of its expense, because it works for everyone over that line. It is just an aid to our own machinery. No one company could afford to sustain such a line out of its own funds. Therefore, everybody contributes for this extraordinary service.

Q. Do you get the same amount for transporting goods from New York to Norfolk or Richmond destined for the West that you do on goods from New York to Richmond or Norfolk destined for the South?—A. No.

Q. Will you explain the principle on which you make the distinction?—A. The distinction is made for us in the through rates; the Atlanta basis, first class, being \$1.11 from New York, while the standard New York-Chicago basis is 75 cents, or 65 cents by our lines. There is not absolutely as wide a difference as that by reason of the different classifications in use. As a rule the southern classification runs lower than the trunk line classification. As a rule I think I am safe in saying that. The rate scale is higher, but the general classification is lower. That the rate scale is higher is due to the vast difference in the tonnage moved, the quantity of goods relatively, as between the East and the West and the East and the South, and the greater number of competitors of all kinds in the Western business.

Q. Are the steamship companies which operate along the coast getting into line in matters of classification and methods of charging by weight, etc., with the railroads?—A. I think so.

Q. A great deal has been made at various times before this commission of the difficulty of rail and water competition. Do we understand you to state that there are certain disabilities, on the other hand, under which the steamships operate in competition with the railroads; in other words, that it is not an entirely one-sided competition between the superior and inferior agent?—A. No; it is not.

Q. Will you speak of such experiments or attempts as you have made to get at the relative costs of different parts of your business; that is, terminal charges, conducting transportation, etc., respecting the principles which in your judgment should apply in such a case in making up rates?—A. The proposition is a very large one, but here is an illustration: One of the striking differences, perhaps, between water transportation and through rail transportation is found in the fact that the steamer must of necessity load into her and have taken out of her every pound of freight that she moves, whereas in modern railroading a very large proportion of the traffic over railroads is not handled at all by the railways. The expense of stowing ocean vessels, even for coastwise business; the necessity for more careful stowing; the fact that the vessels have a number of decks, require a little more skilled labor than is required in running freight into a car; hence the labor charge is a great deal higher, and the steamer has to meet a fixed charge at each of her ports, generally speaking, far in excess of what the railroad has, even when it breaks bulk; and to the extent that it does not break bulk at all it is just that much ahead. Against that, I suppose, might be set the enormous cost of the railroad plant before it can do all this, as against the very much smaller plant cost of the steamship organization.

Q. That being so, a short water route would perhaps not have any particular advantage as to cost over a railroad, terminal charges being so much greater and

there being only a short distance in which to recoup for the lower cost of moving a ship as against a train and for the extra charge of the tonnage?—A. It has seemed so to me. That is the best answer I have gotten to my examination of the subject up to this time, and if you will allow me, I will explain why we do not know a little better. Water lines have no real basis of comparison between one another. The requirements of railroads and their willingness to give much data connected with their business is a great help in operating other railroads. That requirement is not made of the water people, and I suppose they can not well give it out. They can not well make such figures, probably because to do so is liable to invite undue competition, so that we water men have not a chance to compare our results with other water lines similarly situated. Hence I can only give you the result of my own thought at this time, and I confess I have not thought of this subject enough to reach full conclusions.

Q. The long and short haul clause of the act to regulate commerce has been largely set aside in the Southern States by reason of the existence, as the railroads allege, of active water competition at a great variety of points. Do we understand you to say that such water competition is not as great a hardship to the roads where the water route is a short one as it would be in the case of competition with a long-haul water route?—A. No; you can not have understood me in that, because it has never applied to me in that way.

Q. Will you explain how it does seem to you?—A. As far as I have gotten in my investigations, the difficulties there are largely a matter of earnings to the individual companies rather than matters affecting the public.

Q. In other words, the rates are not made by the cost of doing the business, but by other considerations?—A. Yes; practically.

Q. We have had before the commission complaint from representatives of shipping interests at Cincinnati and other places that the rates into the South from such gateways as Chicago, Cincinnati, and St. Louis are relatively much higher than the rates for an equal distance into the South from Eastern centers. Does the existence of this water competition down along the Atlantic seaboard fully justify that condition, if it be as stated? Do I make the point clear?—A. You make the point clear, but it is a singular thing that the great cause of fear that we Eastern men have is the ever growing volume of business from the West to the South, the leaving or diversion from the Eastern shipping points of much business that used to flow through our channels and is now going from the West into the South, and the feeling the traffic men have is to watch that Western-Southern movement, because, moving as it does in very large bulk as a rule, we have felt that it enjoyed lower rates than we have.

Q. Do you refer to the grain and packing-house products?—A. No; I do not; they have a very slight relative movement. They have almost ceased to go East and then South.

Q. How long since was it the custom to bring grain and other products from the West to New York and then ship to the South down along the coast over your line?—A. Fully twenty years. Virginia common points have practically had the advantage of as low rates as Baltimore, and even lower; and Baltimore being under New York, it was an impossibility for us to move it. My understanding is there is some business brought from Baltimore and Philadelphia for coast points farther south—south of Hatteras, but the great volume of the business goes direct by through car movement across the Ohio River, and is distributed all through the Southern States.

Q. In that case, having eliminated grain and packing-house products, you refer to manufactured products?—A. Yes.

Q. Such as, for example, what?—A. Manufactured iron articles, agricultural implements, furniture—a pretty wide range of commodities.

Q. Is that by reason of the growth of manufactures in the Middle West or by reason of the adjustment of the tariffs?—A. Both, I think. Primarily the growth of the manufactures; secondarily, the rates. If I may be allowed to express an opinion, I think rates always follow commercial conditions. I think it is the market conditions which make the rates.

Q. Have you any reason to suppose that those rates have been from the Ohio gateways less than the published tariff rates, inasmuch as they have abstracted so large an amount of this business from the coastwise steamers?—A. I am not in a position to pass on that. I am not closely enough in touch with the rate situation at this time to answer that question intelligently.

Q. That would be a possible explanation, would it not?—A. Yes.

Q. Would any enlargement of the powers of the Interstate Commerce Commission, which would absolutely insure the maintenance of published tariff rates, in

that way operate to the advantage of the steamship lines?—A. From my experience, I would say no. I think not.

Q. You feel, however, that some protection by the railroads themselves, for instance, might benefit that condition?—A. There are railroads and railroads, and steamers and steamers. I am glad to believe that the railroads with which we are associated are just as firm in rate maintenance and in conservative methods as we ourselves could be or could expect under any adjustment.

Q. It has been testified before this commission that such is the condition of eastern lines. Have you reason to suppose it is different on lines that operate farther west at the present time? Have you seen any indication, so far as the abstraction of your business from your territory is concerned, to suspect that rates are being cut in that way?—A. No: as a general proposition, no. We feel that rates in the Southern territory are particularly well maintained. As a section, the transportation men generally feel the Southern territory is clean—that secret rates and so on are almost unknown. I am not immediately in touch with the West and South movement. I do not know what troubles they have, but as far as my general information goes what I say applies to that as well.

Q. Have the costs of operation of water transportation decreased in recent years in the same proportion that the costs of operating railroads have?—A. No. There is a refinement in all water methods, I think, and the lines which are the most successful are successful by reason of that fact. But, for the reasons which I gave at some length a moment ago, we have not the great stimulus of comparison. Some of us are working it out along railroad methods, as I call them, trying to do our best in the most conservative of business methods; and in doing that the public is served, because to do the work most economically means that you must have the best tools. Speaking of our own service, it is infinitely better than it was twenty years ago. It has improved almost as much as the railroad service has.

Q. Is it correspondingly cheaper from the point of view of operation?—A. The methods themselves are more expensive, to keep up with the modern requirements. There is greater expense in operating the line, but with the extension of business which has followed intelligent methods we get a lower cost. I will not say a lower cost, but a cost low enough to give a fair margin.

Q. You would maintain that a scientifically operated steamship line can reduce its cost of operation in the same proportion that the railroads are reducing theirs, so that the relative disability under which the steamship lines operate as compared with the railroads is not increasing?—A. I doubt if the steamer has the latitude to make economies that the railroad has, so its reductions could not lie in the same proportion. There is a relative betterment in the steamer's condition by the better methods. There are certain basing costs, however, like the greater consumption of coal for higher speed, and the greater necessity for electric lighting, and all that sort of thing, which means an added cost which you can not get away from. But the intelligent application of force and mind produces its effect.

One of the questions of the commission, I understand, is as to laws and legislation needed. I do not think any is needed at the present time. I feel that it is incumbent on us to work out our problem further, as far as intelligence and the application of the best business methods will go, before we should ask Congress to legislate in our behalf. That is my personal conviction.

Q. (By Mr. FARQUHAR.) Are you acquainted with the labor cost of operating your boats?—A. Fairly so, I hope.

Q. What is the pay of engineers by the month?—A. On our fast steamers it runs \$125 a month.

Q. How far does the scale run down: how many engineers do you usually have?—A. First assistant, \$75; second assistant, \$60. That means their keep added, of course. They live on board the ship in all cases.

Q. What are the wages of firemen?—A. \$38.

Q. Have you any able seamen at all, or do you just have the deckhand?—A. We have no able seamen in the deep-water sense, but qualified seamen whom we pay \$25 per month.

Q. What are your captains paid?—A. We have two captains who get \$200 a month, two more who get \$175, and one on a smaller ship at \$150. That is on the main line.

Q. Your mates?—A. First officers, \$75; second officers, \$50; third officers, \$30.

Q. Have you a distinction of wheelmen with separate pay?—A. Yes; two quartermasters on each ship (that is the technical name for wheelmen) at \$30. Then there are watchmen, and the full crew, the entire list being as follows:

Pay roll of steamship Jefferson.

Deck department:	
Master	\$200.00
First officer	75.00
Second officer	50.00
Third officer	30.00
2 bow lookouts, each	40.00
2 quartermasters, each	30.00
Watchman	30.00
6 seamen	25.00
2 deck boys	15.00
Purser	83.33
Assistant purser	40.00
Engine department:	
Chief engineer	125.00
First assistant engineer	75.00
Second assistant engineer	60.00
2 oilers, each	43.00
2 water tenders, each	40.00
9 firemen, each	38.00
3 coal passers, each	28.00
Steward's department:	
Steward	75.00
Saloon stewardess	20.00
Forward stewardess	10.00
Chief cook	50.00
Second cook	40.00
Third cook	10.00
Broiler	35.00
Pantryman	25.00
Officers' messman	28.00
Forward messman	15.00
Head waiter	25.00
Waiters (as required), each	18.00
Porter	50.00

Average number of crew, 60.

Q. Have you your own stevedores at terminals, or is there an organization of stevedores at terminals?—A. We do all our own work at all ports.

Q. Have you any rule as to your sea force doing the loading and unloading? Are they engaged in it?—A. No; not on the main line. It is not found to be economical, and a double crew would be required to do that.

Q. What is the ordinary pay of stevedoring at New York?—A. We pay 25 cents per hour week days and 30 cents on Sundays and holidays.

Q. (By Mr. RIPLEY.) Do you employ negro labor at Norfolk?—A. Entirely in the South.

Q. What is the pay of that class?—A. The stevedore rate at all the Chesapeake ports in Virginia—Norfolk, Portsmouth, Pinners Point, Newport News, and all those points—is 15 cents per hour for the men who run the hand trucks. The men on the ship who stow and take out, and so on, get 20 cents an hour. That is found to fairly reflect the differences in the value of labor and the living conditions and all. It seems to equalize between the North and the South fairly well.

Q. (By Mr. FARQUHAR.) In your annual statements in the coastwise trade, what is the usual percentage that is set aside for depreciation?—A. I think there is no set rule. Our own method has been to have a reappraisal by a committee at periods of about two years apart, reflecting the actual condition upon examination. We have tried to be very conservative in that respect. The lines have different methods. I think there is no established procedure.

Q. Has the coastwise trade any advantage in rates in marine insurance over ships in the foreign trade?—A. Yes; in this sense: I think the underwriters feel that the coastwise risk is less; that it is of a different character from the deep-sea insurance.

Q. Is your insurance placed in American or foreign companies?—A. Both.

Q. What proportion?—A. At a rough guess, perhaps half and half. May I supplement that statement by saying that my own feeling is that our advantage is best served to have as much placed in the home market as we can. But we soon exhaust the home market—the American market. The insurance companies do not like to take big risks, and we are very large insurers in cargo and hull. So

we fill up with all the American insurance we can get, and then go abroad. That is the practice to-day.

Q. Are the foreign and American rates on the same basis?—A. Practically, because we decline to pay more.

Q. Is there much competition among the foreign countries to acquire American policies?—A. I think so. The foreign policy has been a little more favorable than the American policy heretofore, but the American companies are now beginning to write the more comprehensive form of policy; so that the American form of policy, which in the old days was not so desirable, is being improved.

Q. Is your foreign policy taken under the Lloyd insuring rules or under American inspection?—A. The vessels are upon American inspection. We build according to the American rules, and they base on that. Our ships do not come under Lloyd's rules at all.

Q. They are under the American standard?—A. Yes.

Q. And the foreign companies accept the American standard?—A. If one of our ships was loaded for offshore they would not do that.

Q. At anytime have any of your coastwise steamers been drawn into the foreign trade?—A. We have chartered to the West Indies, and once, in the old days, to Brazil. We do not like to have our vessels go offshore; we prefer to keep them at home.

Q. (By Mr. PHILLIPS.) Did you state the amount of your capital stock?—A. I did not. It is \$1,250,000.

Q. Have you any bonds?—A. One million 5 per cent bonds.

Q. Preferred or common stock?—A. Just the one; \$1,250,000 of stock and \$1,000,000 bonds outstanding.

Q. (By Senator KYLE.) What percentage of the operating cost of your line goes toward labor?—A. Of what in our statistics appears as labor, the absolute labor cost of handling our freights, and which is summed up in our trade as 'longshore labor, nearly 25 per cent of our total cost (24.7 per cent, to be exact) is paid for labor. If you include the clerks and agents, a step higher up, the proportion is 33.6 per cent of the entire operating expense.

Q. (By Mr. KENNEDY.) I would like to ask you how the coastwise interests view the proposition to subsidize American vessels in the American trade; whether they have any particular interest in such a course any more than the people at large?—A. I suppose they merely have the individual opinions that each man gets from reading the papers and reading the discussions, and so on. Speaking for myself, I find it difficult to make up my mind either way, because I have not the data to do it on. I do not know the conditions surrounding lines other than our own, so that my opinion would be no better than that of any railroad man or banker, or publicist.

Q. You could not say whether such a policy would affect your interests?—A. It could not directly, because we could not come under it. We could not participate in its benefits, and I do not see how it could affect us other than if it added to the tax burden we, as taxpayers, would pay a little more. That, however, would come around in the additional trade and all that goes to make that up. Of course we carry between our ports considerable business which goes export from the end of our line. So, I suppose, it is an endless chain.

Q. You employ union labor?—A. Our labor may or they may not be in the unions. We have no rules or restrictions as regards that.

Q. Are any of the members of the Seamen's Union in your employ?—A. I think so, but it does not appear. We place no restrictions on our men in doing what they choose in that way so long as they are devoted to their duty.

Q. Are the men aboard ship generally Americans or of other nationalities?—A. I think the seamen, of which, of course, we do not have to carry many, are generally foreign in the lower grades. The higher grades are necessarily American.

Q. (By Senator KYLE.) What nationality?—A. There seems to be a large Scandinavian element in all our coasting vessels. They seek the employment: they take to it. And, of course, on modern steamers there is really very little sea work. It is scraping and keeping things clean, and handling lines and all that; and the old-time able seaman has no place on a modern steamboat, or any other steamboat, in fact. Following the sea is not attractive to American men in this day. I am sorry to say. It is a very difficult thing to get the old line of well-trained American seamen.

Q. Is that because sea life has become obnoxious or other callings more inviting?—

A. Prizes of high positions are too few and other callings are more inviting.

Q. (By Mr. LITCHMAN.) From what sources, then, do you recruit the ranks of the higher-priced officers?—A. I think we are very nearly at the end of the old deep-sea sailor, and what is to take his place is a question we are all asking ourselves.

We are training in young men as fast as we can get them, but they are hard to get. It is a hard thing to find a captain that has had the old training.

Q. (By Senator KYLE.) Wages are good?—A. Yes; they are almost the maximum.

Q. (By Mr. LITCHMAN.) The foreigner who is capable of manning a ship must first become naturalized before he would be eligible to promotion?—A. Absolutely. I think we have only one captain of foreign birth, and he has been an American citizen for a great many years. All the rest are Maine and Massachusetts seamen, who came up through efficiency and are expert seamen. We pay them well and treat them well. Our men do not lose a day's pay perhaps in 10 years.

Q. (By Mr. FARQUHAR.) To the average seaman or petty officer, does the coastwise trade offer greater inducements than the deep-water trade?—A. I think it is not felt so, except as the men can be oftener at home and have more home life. That is the attraction, that a man can be at home every few days.

(Testimony closed.)

NEW YORK, February 20, 1901.

TESTIMONY OF MR. THOMAS F. WOODLOCK,

Railroad editor of the Wall Street Journal, New York City, N. Y.

The special subcommission met in the rooms of the Chamber of Commerce at 10.45 a. m., Mr. C. J. Harris presiding. At 2.50 p. m. Mr. Thomas F. Woodlock, railroad editor of the Wall Street Journal, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Mr. Woodlock, will you give your name and address?—A. Thomas F. Woodlock; railroad editor, Wall Street Journal, No. 42-44 Wall street.

Q. (By Mr. KENNEDY.) To begin with, can you give the commission any information or any light on the proposed combinations or community of interest arrangements in the anthracite coal fields?—A. Well, the only information that I have is derived from the published prints; but it seems to me pretty clear that what the railroad companies have been doing, or endeavoring to do, is to purchase the comparatively few remaining coal lands in the hands of independent operators, so as to prevent the danger of a competing line ever being built again that would take away such independent tonnage as they now have. Without going into figures any too closely, I should say that the companies have bought up probably an amount of annual tonnage equivalent to say 6 per cent of the total—about three to three and a half million of tons a year, including the Pennsylvania Coal Company, which, of course, is the largest item. The others are scattered purchases.

Q. (By Mr. RIPLEY.) Giving them a control of what proportion of the total tonnage?—A. Well, it is a little hard to give any definite figures on that, because the shipments over the coal roads, as I understand the matter, include both the independent tonnage and the tonnage owned by the road; but on last year's basis the companies which are generally, by popular rumor, supposed to be more or less affiliated in this matter, namely, the Reading, Lehigh Valley, Jersey Central, Pennsylvania Coal Company, Erie, Susquehanna and Western (which is owned by the Erie), and the Lackawanna, which are generally understood to be acting in concert, got about 72½ per cent of last year's shipments. The Pennsylvania Railroad is independent, but has always acted with the strong interests whenever it has been necessary to do so. That is to say, the Pennsylvania has never been a disturber, and can always be counted on by the majority.

Q. (By Mr. KENNEDY.) Why has it been independent?—A. That company has never been obliged to ally itself with individuals; it is an extremely strong corporation, and it has been its policy not to adopt any entangling alliances, so far as we can judge. With the Pennsylvania Railroad and the Delaware and Hudson, which are supposed not to be brought under that influence, there would be left 7½ per cent.

Q. Is that all? How about Coxé Brothers and the Ontario and Western?—A. I have given 100 per cent; that is, as far as it is shown in an unofficial way.

Q. Where does Mr. Haddock come in?—A. In the Erie Railroad shipments, Coxé Brothers have the Delaware, Susquehanna and Schuylkill road. It is a comparatively small road, but it gets nearly 3½ per cent of the total tonnage.

Q. Do you believe that the community of interest established by those roads will absolutely control the anthracite coal situation?—A. I think that there is a sufficient community of ownership already to assure that. In other words, I do

not think that the Ontario and Western is allied to it in any way, and I do not think that Cox Brothers & Co. are; but I think that most of the others will act together. The Ontario and Western is a free lance, but it is not unreasonable; it attends to business, and makes the same prices as the others do.

Q. Do you believe events point to absolute ownership under one single management?—A. No; I think it would be a very injudicious thing, from the point of view of the coal roads.

Q. Why?—A. It would simply provoke extreme competition. Then, besides, there is a natural bar to any total monopoly in the anthracite business. As I have always understood, when the price of anthracite goes above a certain level the consumption falls off very rapidly, because bituminous coal is used even under difficulties, and there is a great increase in the consumption of gas in the cities, and it is not practicable to keep the price of anthracite at any high level.

Q. You say provoke competition?—A. Provoke legislation that might not otherwise be justified. I do not think it is the intention of the people connected with the coal roads, so far as I can see, to do anything more than agree on prices, and especially so as to avoid spoiling the market.

Q. Have you an opinion as to the economies that will be effected by the community of interest arrangement?—A. I do not see how there can be any special economy where there is no physical union of the properties. For instance, the purchase of the Pennsylvania Coal Company by the Erie does not, as far as I know, involve any consolidation of the affairs of the two companies. The chief expenses of coal production are mine work and breaker work, and that is more or less dependent on the tonnage. Where there would be, if it were possible, a great economy would be in the establishment of a single selling agency. That would save a great deal of trouble; but I do not know whether the matter is going through; it would certainly evoke some opposition.

Q. (By Mr. RIPLEY.) Was that not the principle of Mr. McLeod's plan of 1893?—A. I believe so.

Q. Namely, to establish a single selling agency?—A. Yes. Mr. McLeod had a pretty logical plan that dealt with the whole thing, and Mr. Morgan seems to have followed some parts of it in his recent operations.

Q. He has apparently avoided certain pitfalls which beset the way of the former attempt?—A. Oh, yes; I think so. For a while the lease of the Jersey Central to the Reading was objected to at the time, but there can be no particular objection to the Reading's owning 51 per cent of Jersey Central stock.

Q. (By Mr. KENNEDY.) You believe, then, that the community-of-interest idea is for the purpose of eliminating the independent tonnage?—A. No; I think that was an afterthought. I think that arose from the necessity of buying up the independent or the possibly independent coal lands accorded by Mr. Morgan to the anthracite roads when the Pennsylvania Coal Company took up the new coal road, the Delaware Valley and Kingston, along the line of the Delaware and Hudson Canal, and let it be known they were going to build their own line unless there was a fair reduction in anthracite rates. That stimulated the purchase of productive coal lands.

Q. Which road purchased a large part of those coal lands?—A. The Ontario and Western bought quite a block from the Lackawanna Iron and Steel Company, which was owned by the Lackawanna; but that was a case where the tonnage was not really independent, because it was owned by one road and sold to another. The Ontario and Western also bought about 600,000 more tons a year capacity this winter. That, with the tonnage of the Pennsylvania Coal Company, makes up about the 6 per cent I spoke of as having changed hands since this thing started.

Q. (By Mr. KENNEDY.) Can you tell us something about the purchase of the Pennsylvania Coal Company by the Erie Railroad, first by the commissioner who acted for them and then by the Erie Railroad?—A. All we know about it is that the operation was very quickly conducted. It was known that negotiations were taking place between Mr. Morgan and the Pennsylvania Coal people, and it was also thoroughly understood that he was acting for the Erie in the matter. Our understanding was that he paid the equivalent of about twenty-eight or twenty-nine million dollars for that property to the Pennsylvania Coal Company, acting for the Erie road. He got a commission—how much we do not know, but the ordinary banker's commission in such matters. I think the commission took the form, to the syndicate, of some Erie first preferred stock. There was five millions of first preferred stock issued as a sort of bonus in connection with the underwriting.

Q. Did he pay a high price for the stock, and then did the Erie later on pay a still higher price?—A. I think that Mr. Morgan got a commission from the Erie.

Q. Was not the purchase in the first place by him, he making later a sale?—A. It was a purchase by him and later a sale to the Erie; but it was necessary for him to follow that plan, because he had to act quickly.

Q. Was there a very high price paid for the Pennsylvania Coal Company property or was it considered a moderate one?—A. Well, so far as the records go, at least so far as I know the records, it is the highest price that has ever been paid for a block of coal land within the history of the business.

Q. (By Mr. RIPLEY.) You mean per acre?—A. I mean per ton of output. That is the only way one can consider it. Of course, if the Pennsylvania Coal Company has a large quantity of undeveloped land, which is not my understanding, this price is not so high; but, assuming that it is a fairly well developed property, the price paid in comparison with what Mr. Gowan paid for the Reading coal lands—that price broke the Reading at the time—is very high. You can figure it this way: Assume that the Pennsylvania Coal Company cost the Erie \$32,000,000 and that the Pennsylvania Coal Company's lands turned out $4\frac{1}{2}$ per cent of last year's shipments of coal. Now, the Reading turned out 20.7 per cent, and by making an equation between the two or valuing the Reading coal lands on the Pennsylvania Coal Company's basis, they worked out at something between \$125,000,000 and \$130,000,000. At the time of the last reorganization those Reading coal lands stood on the books at \$70,000,000, which represented not their original cost, but a considerable sum of money for deficits also that were charged for cost of land; but even if you suppose they cost \$70,000,000 back in 1870, they stand to-day on that valuation as worth \$125,000,000. Now, the Reading has gone into bankruptcy twice since that time—once in 1888 and the second time in 1893.

Q. Was that bankruptcy due to carrying that land at so heavy a price?—A. Undoubtedly.

Q. On this basis the purchase of the Pennsylvania Coal Company would entail an exceedingly heavy burden in addition to the present debt burden of the Erie Railroad?—A. I think it will cost them 4 per cent on \$32,000,000—\$1,280,000 a year plus whatever dividends they declare on five million of preferred stock that went in.

Q. In other words, how much, approximately, on each ton of coal that that Pennsylvania Coal Company puts out has got to be charged up to interest on this purchase, approximately?—A. Approximately 60 cents; 50 to 60 cents a ton.

Q. Supposing that this operation involves an addition of 60 cents a ton on each ton of coal the Pennsylvania Coal Company puts out at the present price, what effect will that have on the price of coal produced in the entire remaining field?—A. It would not necessarily have that effect, because the Pennsylvania Coal Company used to pay dividends at the rate of—I forget the rate, but it is a very large rate—and likewise piled up an enormous surplus which was divided among the stockholders before the deal was made, so that all profits of the Pennsylvania Coal Company will necessarily go to the Erie, whatever profits there may be on the output of coal.

Q. In other words, this 60 cents a ton will not be put on the price of coal?—A. No; but it will come out of the coal company's profits.

Q. Does not that profit concern the public?—A. It does not concern the public as much as it does the Erie.

Q. (By Mr. KENNEDY.) Do you anticipate any benefit to the coal-consuming public as a result of this community-of-interest arrangement between the railroads in the anthracite country?—A. I do not think that it will have very much effect either way.

Q. You do not?—A. No; because experience goes to show that it is very easy to haul coal prices down, but very hard to put them up. If it had not been for that strike last year coal prices to-day would have sagged a little, and they have been unable even yet to put the prices to where Mr. McLeod had them. My understanding is that even at to-day's high prices, following the results of last year's strike, the price is not as high as Mr. McLeod succeeded in establishing.

Q. Is the price unreasonably high at this time?—A. I could not answer that question; I have no way of telling. But here is a point bearing on that: Not one of these coal roads, with the exception of the two old companies, the Delaware and Hudson and the Lackawanna, is doing very much more than making a fair dividend, and some of them are not doing that. Now, the Jersey Central is doing a good deal better than it was doing 3 or 4 years ago, but a great deal of its improvement has come from general business. The same is true of the Reading. The Reading has made quite an improvement, and if you will look into the Reading's figures, you will find that their general traffic, merchandise of all sorts, is very largely responsible for the amount, not the coal companies. The Lehigh Valley and the Reading Coal Company, and such coal companies as are reported separately by the railroad companies, all show deficits. The Lehigh Valley Coal Company showed a big deficit last year. The Lake Erie and Wilkesbarre showed profits. The Jersey Central has piled up an enormous debt. Now, you can

say, if you will, that the transportation companies simply charge everything to transportation, and that the coal companies most usually show a deficit; but the transportation companies are not making very extraordinary profits. Neither the Reading nor the Erie nor the Lehigh Valley nor the Jersey has done very well.

Q. (By Mr. RIPLEY.) Do you refer to the absolute amount of profit or profits relative to the capitalization?—A. I mean earnings; I mean absolute figures. They do not usually show very largely. They have not done nearly as well as many other companies, and there is a distinct prejudice against these securities of anthracite companies on the ground that they are handicapped by the nature of the product. It is a very hard thing to control; it is an unsatisfactory thing to have to do. Anthracite is expensive to mine, expensive to handle, and the owners have never been able to control the market to such an extent as to make reasonable profits on anything but a very low capital. The reason why the big profits were shown by the Delaware and Hudson and the Lackawanna Coal Company is that the capital was low at the start.

Q. Have these companies ever been reorganized or in the hands of a receiver?—A. I do not think the Lackawanna or the Delaware and Hudson has ever been in trouble.

Q. In other words, the roads which are kept on a low capitalization have steered clear of reorganization and receiverships?—A. Undoubtedly.

Q. Those which have taken the opposite course have been continuously in the hands of the receivers?—A. Well, that is just the record.

Q. (By Mr. KENNEDY.) You believe, then, that the public have an exaggerated belief as to the profits that go to the coal roads?—A. Yes; I think they have. I would sooner go into the bituminous business, where coal is handled at 2 and 2½ mills a ton a mile, than into the anthracite business where it is handled at 9 mills a ton a mile.

Q. Why should there be such a difference in the handling of it?—A. I can only see the outside of it; but in the first place, as I understand it, most of this anthracite coal has to be hauled out over the mountains—pretty steep grades on those roads, some of them excessively steep. The Reading seems to be best situated in that respect. Then anthracite coal is broken and has to be screened and sorted. You can not mix the cars, and you can not handle cars of anthracite like you can cars of the bituminous. Even at tidewater you have got to be careful of it, and I should say probably there is a justification for the difference.

Q. Does not bituminous go in cars over the mountains?—A. As a general thing bituminous originates at the top of the grades. The Chesapeake and Ohio handles a large quantity of soft coal, and that coal originates almost on top of the grade, so that if you started the cars they would run pretty much to tidewater without a locomotive. That is true in a general way of soft coal, as far as I know, on nearly all the railroads which carry it. It is partly true also of the Pocahontas coal fields and of the Northwestern fields on the Norfolk and Western. That is not true of anthracite. I speak now simply as an outside observer. I have no experience at all in these matters.

Q. You would not believe that this apparently high charge per ton per mile of anthracite in comparison with bituminous is put on by the railroads for the purpose of eliminating the independent coal dealers, or has that rate prevailed all the time?—A. Oh, no; the independent operators used to have contracts with the railroads whereby the rate of transportation they paid was based on tide-water prices. The railroad took the coal and sold it.

Q. How about the man who was independent in mining and shipping?—A. He would get the railroad to ship what he had and would deal with the railroads after this fashion: They would take his coal to market and sell it and give him 60 per cent of the price at tide water, New York. Now, there was an attempt made by the operators some 2 years ago or 18 months ago to change that basis to 65 and 35, and just before the Pennsylvania Coal Company was bought, or rather when the independent road project seemed to be about materializing, concessions were made, as I understand, to a number of individual operators, and the railroads agreed to handle business on the 65 and 35 per cent basis, the operator getting 65 per cent and the railroad 35 per cent. Of course the higher the tide-water price the better price the railroad got.

Q. Then the independent shipper shipped at 37½?—A. Sixty-five. He paid 35 per cent of tide-water price for his transportation, and I believe that to be the ruling rate now.

Q. (By Mr. C. J. HARRIS.) These anthracite coal roads could not haul the coal at the soft-coal price and make anything, could they?—A. They could not, because if you look at their accounts they are not making very large sums anywhere.

Q. It would not be a business proposition, in other words?—A. No.

Q. (By Mr. RIPLEY.) I would like to ask a question. Can you make any statement respecting the terms on which the Jersey Central was purchased by the

Philadelphia and Reading? In what way does that differ from the operation of 1893, in which the Philadelphia and Reading and the New Jersey Central were concerned?—A. In 1893 Mr. McLeod leased the Jersey Central from the road on a 7 per cent dividend. This time the Reading has bought something over 50 per cent, or else exactly 50 per cent of Jersey Central stock at \$100 a share, and it has offered 4 per cent bonds to be issued in payment of the debt.

Q. Is that quotation of 100 high as compared with the quotations of recent years?—A. It is the highest price for which Jersey Central has sold, as far as I know, since probably 1881.

Q. The bonds will be floated to that amount?—A. Bonds will be advertised to-day—twenty-three millions of collateral trust 4 per cent bonds.

Q. Will the effect be to issue a large proportion of bonds, constituting a fixed charge?—A. Yes; the road undertakes a fixed charge of \$920,000 a year, and it receives whatever dividends are received on Jersey Central stock, on the amount it holds, which is about 50 per cent.

Q. Suppose a period of depression should come and the price of the remainder of that Central of New Jersey stock should drop, nevertheless this being fixed in bonds will remain a constant permanent charge?—A. Certainly.

Q. Good times or bad?—A. Certainly. The fact is that the Reading bought half of the Jersey Central stock at the highest price for which it had sold in many years.

Q. Will not that burden the lessee with a very heavy fixed charge on which it has to earn dividends in the future?—A. Yes; \$920,000 in one case and \$1,280,000 in another, and the interests on those sums must be forthcoming, good and bad times.

Q. Will that have any effect on the price of coal, the Reading being a large producer of anthracite coal, indirectly or directly?—A. In so far as the Reading Company and the people connected with the Reading Company and those other big companies can get a big price for coal, of course they will try to do so. The whole question depends on the ability and the intelligence of those people to realize how far their ability can go. I think they mostly realize that it is not judicious for them to attempt to get a very high price for coal. What they need is a steady market at what they consider to be a reasonable price.

Q. You have stated several times that certain of these roads are supposed to be in common ownership. Is there any way of knowing publicly which roads are owned in common?—A. There is no matter of record; there are no figures; but it is thoroughly well understood. For instance, Mr. Morgan represents a group of interests that are undoubtedly dominant in the Reading, Lehigh Valley, Jersey Central, Lackawanna, Erie with all its appendages, and it is believed that they are taking steps to control more or less the Delaware and Hudson. But as to the last named it is indefinitely known. It is believed in the street that the Delaware and Hudson is being brought into camp.

Q. But such information as to the others, respecting the other roads is———A. (Interrupting.) A matter of hearsay; unofficial.

Q. Is there any evidence of common action of those roads to a certain end, any evidence of substantial agreement on price to tide water, or anything else of that sort?—A. No; except that they all sell coal at about the same price and make their changes at about the same time.

Q. Is there anything new in that?—A. Nothing whatever; it has been going on pretty much that way since 1884 or 1885. There was a period of disturbance after McLeod's scheme failed, and nobody knew just what the prices were, but during the last five or six years there has been the usual harmony of price that exists in any trade. I think that is the extent of the business here.

Q. Can you state anything with respect to the men who are directors at the same time in a great number of these companies that you have mentioned? Are the same men in the directorate of a great number of these companies? You need not specify actual names.—A. I think they are. I think that Mr. Morgan has representatives in the Reading and in the Lehigh Valley, but I do not know whether he has yet in the Jersey. He has in the Erie, of course.

Q. (By Mr. KENNEDY.) You said just now that Mr. Morgan owned a dominant interest in some of these roads.—A. Mr. Morgan and the interests allied with him, the interests that he represents and acts for; quite a number of people are concerned.

Q. Can you say what interests those are?—A. Mr. Morgan generally has the support of the leading financial interests in the street when he gets started in an operation. In this instance it is customary to talk of the Morgan interests, meaning just that line. People talk about the Morgan roads, the Vanderbilt roads and the Gould roads. The Morgan roads are the Reading, the Lehigh Valley, the Southern Railway; those are distinctive Morgan roads.

Q. It is not so much Morgan capital—?—A. (Interrupting.) That I can not tell. Mr. Morgan has very large capital, and no doubt he has a large amount invested. He is believed to have the power of changing the boards; in other words, what he says on these matters "goes." That is about the situation. Just why it should "go" and how it goes we can only conjecture.

Q. (By Mr. RIPLEY.) Is there any such influence in the directorate of the New England roads?—A. Mr. Morgan is supposed to be strongly interested in the New Haven, but the New Haven has other affiliations which would prevent its being controlled by him except to a very limited extent. I do not know of any such influence.

Q. You have heard the statement that in 1893 Mr. McLeod's downfall was due to the policy of the New Haven road acting through Mr. Morgan's influence?—A. I have heard that. That has been one of the things that have been suggested.

Q. Does it appear to you to have been proven?—A. Oh, nothing was proven. There is a general impression that it was an incident of common occurrence, where one interest fights another.

Q. Is there, in your opinion, any attempt of these anthracite-coal roads to get an independent entry into New England over their own lines or over lines controlled by that same syndicate?—A. I haven't heard of any. The Poughkeepsie bridge route takes some coal now.

Q. (By Mr. KENNEDY.) Is there any overcapitalization of the coal roads?—A. I think anybody would admit that the Reading is overcapitalized, from the fact that after 4 years of pretty steady demand and prosperity the common stock is worth no more than 30 cents on the dollar in the markets. I think anybody would say that the Erie is overcapitalized. The record of reorganization of both of those roads was very faulty; they were left with heavy burdens.

Q. Since you touch on it, I would like to ask if you care to speak generally on the overcapitalization of the American railroads.—A. I think, as a general thing, our railroads are not overcapitalized. If you take the railroads together they are capitalized for about \$61,000 a mile, stock and bonds—both together.

Q. All kinds of stock?—A. All kinds of stock and all kinds of bonds, which is about \$8,000 a mile more than 15 years ago; and one reason for that increase in the capitalization has been such reorganizations as those of the Richmond Terminal and the Erie and the Reading. Each swelled the volume of junior securities that was not expected to get any dividend to an absurd extent. Now, take the case of the Erie, for instance. I have not figured up just how the new securities of the Erie compare with the old, but the old Erie had a capitalization of about \$70,000,000, common stock, if I remember right. Now it is about \$50,000,000, preferred, and \$112,000,000 of common. It has not any more property now than it had then, and it has more bonds. In other words, the Erie road is undoubtedly capitalized for a good deal more per mile to-day than it was 20 years ago.

Q. Is not the Erie a more valuable property to-day than 20 years ago, from the earning standard?—A. I think so, because the country is growing up to the Erie. Mr. Hill is recognized, I guess, as the foremost railroad man in the United States, and Mr. Hill has told his friends that he thinks the country has grown up to the Erie road now and that it can make some money, and perhaps pay something on the common stock. But, you know, for the last 5 years Erie stock has been a joke in the street. Everything else has gone up, and people have taken an interest in it. It was only when Mr. Hill went into the road that anybody paid any attention to Erie stock.

Q. (By Mr. RIPLEY.) What has been the movement of that stock since that time?—A. It has gone up from about 15 to 30; just about doubled in price.

Q. (By Mr. KENNEDY.) Is not some of this increased capitalization of the Erie justified on account of the value of the property from an earning standpoint?—A. There was no necessity for it. The old Erie common stock sold in 1892 for a higher price than what the Erie common is selling for now. Eight years ago the old Erie common stock sold for more than the present does. There was no necessity to issue great masses of all that stuff. It is a wrong principle. What Mr. Morgan did in all his reorganization was to estimate the minimum of earning capacity and take care to get the fixed charges down to that, but when he came to charges that were not fixed, or to securities dependent on future prospects, people could pretty much help themselves.

Q. How is the case affected by this overcapitalization?—A. It is not affected; it has no power whatever on the rates or earnings. Capitalization is a resultant of forces, and not a force itself.

Q. Would the labor part of a transportation line be affected by it?—A. No. A railroad nowadays starts with gross earnings, and its earning capacity varies strictly with its gross earnings. And if you know what a road's gross earnings

are likely to be, you know what its capitalization is going to be. No matter how you start, whether with the cost of the road or promoters' profits four times multiplied regardless of cost of the road, you must come sooner or later to where your capitalization must meet your earning capacity. Earning capacity is the final test of capitalization. It is the only thing that prevents overcapitalization, because all the other factors tend to make it swell. It is the natural tendency of bankers to promote. It is their business. As earning capacity grows the tendency is for capitalization to grow with it.

Q. You think passenger rates and freight rates are in no wise held up by overcapitalization?—A. Not by overcapitalization. They are governed by conditions into which capitalization does not enter at all. That is my view.

Q. (By Mr. C. J. HARRIS.) Where there was a dispute in regard to rates, and it was taken before the Interstate Commerce Commission, then, of course, the capitalization would have to be considered; they would have to deduct, as you say, the actual capitalization—that is, what it was worth—not what paper bonds or stock might be issued?—A. I should not consider that would be the way to go about the question at all. I should differ entirely with the Interstate Commerce Commission. I do not think the original cost of the road has got anything whatever to say to reasonable rates.

Q. But you would have to take into consideration the actual value of the road some way, would you not?—A. Not its original cost. There is only one way to do it—earning capacity and a reasonable return on the capital.

Q. (By Mr. CONGER.) Capital invested or capital stock?—A. Why, take the whole volume of capital invested. I should say that if a railroad were to pay anywhere from 6 to 8 per cent on all the stock and bonds, on its cost of road, the item of cost of road in a balance sheet, as a rule, will come near representing the stocks and bonds on the other side, except where a railroad has investments in the stock of another road. But you will find the cost of equipment about represents the quantity of bonds and stocks outstanding.

Q. Does the account "cost of road" on the books of a railroad corporation usually indicate the sum for which that road could be reproduced?—A. No; the cost of duplication is a very different thing from the original cost. Now, the strength of the Pennsylvania Railroad to-day lies in the fact that it is only bonded for about \$47,000 a mile. You could not duplicate the Pennsylvania Railroad to-day for twice that sum. To hold the Pennsylvania Railroad down to 6 or 8 per cent on \$47,000 a mile is to limit the recompense for ability, care, and economy.

Q. Is it not a fact that on the books of some of these railroads this cost of road is usually much more than the cost of reproduction, that having been brought about through construction companies, or something of that sort?—A. The cost-of-road item generally contains a good deal of matters that are not purely construction, such as discount on bonds and analogous items, and it may happen that those are unusually large; but it will not, as a rule, represent a great deal more than the actual sum so spent. The Atchison road, when Mr. Stephen Little examined it, showed the composition of the line, and it did have a great deal in the item that represented other things besides rails and ties and work on the track. Those things are cost of the road. Discount on bonds is cost of the road, in that sense.

Q. Well, certain discount on bonds might be justifiable in the cost of the road, but on the other hand I think you would have to agree that cases have been known where contracts have been given to construction companies, those construction companies being in fact officers of the road, for pretty fancy figures.—A. I have heard of such things.

Q. Fifty per cent. or 100, more than the road is built for?—A. I think if you take the cost of equipment of the roads of the United States, if you had an Interstate Commerce report or a Poor's Manual, and take that item for all the railroads of the United States, I should say it would represent within probably 10 or 15 per cent the actual cost of those roads as charged to that account, but it would not begin to represent the real value of those roads.

Q. You think the real value would be much more?—A. Because the railroads have become naturally more valuable on account of the growth of population; and, second, because large amounts of money have been diverted and gone to the improvement of the roads and no credit taken for it in the permanent accounts.

Q. Is not the reverse sometimes true, that the charges have been made to appear as assets—cost of roads—when they really ought to have gone to operating expenses?—A. That is true in a sense, but if you were to subtract the amount charged against income and spent for betterment of the property you would have a tremendous balance on the other side. It is pretty much impossible for a railroad to do that now without its being incidentally jumped upon.

Q. You stated a few moments ago that you take issue with the Interstate Commerce Commission as to its method of ascertaining a reasonable rate. Can you outline what you think would be a proper way?—A. No; I think just enough to disagree with their method. I do not see any method to determine a reasonable rate; only I do not think the original cost of the road should have any important bearing in the matter at all. There are just two things that seem to me to bear on the matter, and one of them is the cost of duplication—laying down alongside of that railroad another railroad similar, with terminals, with business provided for it, and everything else. That seems to me to be the more important thing. If a road cost \$15,000 a mile 30 years ago, and has kept its capital account intact and added nothing to it, and to-day is earning \$6,000 or \$7,000 a mile gross, and making the equivalent net, I do not think its construction accounts, as they stand on the books, have anything to say on the matter at all. Otherwise you prohibit all growth. I do not agree with the Interstate Commerce Commission plan. I should be very sorry to have to get up and prescribe one, but I disagree with their method.

Q. (By Mr. RIPLEY.) Is not a large amount of this increase in the value of railroad property due to the rise of value of land itself—that is, to the increase in the value of the right of way?—A. Well, I should say that the increased value of the land is largely the result of the presence of the railroad and the growth of the population.

Q. The railroad was there 30 years ago, and the population, was it not?—A. The railroad has preceded the population in a general sense. In all parts of the United States the railroad has gone first and the population have followed.

Q. How does the capitalization of the railroads compare with the capitalization of our new industrial combinations?—A. There is no standard by which one can compare the two; but I do not hesitate for a moment to say that, comparing the average of all railroads of the United States with such companies as Federal Steel and Steel and Wire and these other big concerns, that the railroads are capitalized in an ultra-conservative manner, or, if you would like to put it around, you could say the others are capitalized up to the limit that the people that are expected to buy the stocks will take. You know there have been cases where the capitalization of some railroads has been absurdly low, and there has been a tendency in all such cases for these railroads to be reorganized in just a contrary fashion to that in which a railroad is reorganized when it is bankrupt. The Chicago and Alton is an excellent case. It was a peculiar proposition. For the matter of about 18 or 19 years it stopped still; would not build anywhere; just simply stood still and ran its road. Mr. Blackstone, who was quite an elderly man, was in control—almost held control himself; with two or three others he held control of the road. It stood still and paid big dividends of 7 or 8 per cent on its common stock right along. Mr. Blackstone became sick, and some of the directors concluded to sell the road. At the time they were selling it they had an earning capacity of about, if I remember right, \$2,900,000 a year. That was the net earning capacity of the Alton road. It was a machine that was turning out that much in net earnings, and it was then capitalized, if I remember right, for about \$24,000,000. I will give you the figures exactly [reading from book]. The road had twenty-two millions par value of stock, of which some was common and some preferred; and it had about eight millions of bonds as well; call it thirty millions altogether, and I think it earned substantially \$2,900,000 a year with reasonable certainty all the time. The earnings were very steady. They didn't grow, and they didn't fall off. Now, the bonds on the road and rentals—the company had leased some lines—absorbed a matter of \$1,100,000, which left substantially \$1,800,000 for the stocks. Now, when Blackstone was sick these stocks were offered. The Alton road was in the market. Nobody that had the money would buy it. It was offered first to a big railroad man, whose name is not necessary to mention, because he didn't buy it. Then Mr. Stilwell, of the Pittsburg and Gulf road, tried to form a syndicate to buy it, and for some two or three weeks talked about it; but he could not do it—was not big enough—and finally Mr. Harriman bought it, and Mr. Harriman agreed to pay \$175 a share for the common stock, and \$200 a share for the preferred stock of the old road, representing a cost to him of \$40,000,000 for the \$22,000,000 of stock. He bought the earning capacity of the Alton road over its bonded debt of \$1,800,000. Mr. Harriman then added a matter of about $4\frac{1}{2}$ to 5 per cent of earning capacity on the cost price to him of the Alton road. He knew that a first charge on that earning capacity could be floated at 3 per cent, or even less. In other words, he knew he could get his cost price and leave himself the rest for his profits. Well, sir, the Alton road, after having had a capitalization of eight millions of bonds and twenty-two millions of stock, now has a capitalization of \$54,000,000 of bonds and \$40,000,000

of stock, in all \$94,000,000; and fixed charges on those bonds and the dividends on that preferred stock just absorbed the \$2,900,000 earning capacity of the Alton road.

Q. Is it the same road in mileage?—A. Not altogether: because they have bought a small piece of road, about 50 miles long, that they didn't have before; but it is substantially the same. Instead of being about 847 miles it is about 900. There is a case where you see the bonded debt has been swollen nearly seven times and the stock capitalization has been doubled, and yet the road did not have to earn a dollar more than what it used to earn before, and everybody is ahead.

Q. (By Mr. RIPLEY.) Is everybody happy? Are the shippers along the line of the road happy?—A. I do not know whether the Alton has made any change in rates or not.

Q. Referring to a question by the chairman, do you assume for a moment that that road was entitled to earn by the rate on freight a return on ninety-odd millions of capital?—A. Certainly not.

Q. What basis is it entitled to a rate upon?—A. It is entitled to earn a fair rate on the cost of laying down another Chicago and Alton road alongside of it to-day.

Q. Which would be how much, so far as you can judge?—A. I could not tell what it would cost to duplicate the terminal; but, in a general way, if you will allow free trade in the building of railroads, and especially if there is any possibility of securing condemnation of property for terminals, a railroad's rate will be kept down to such a point as for it to be just unprofitable to put down another road.

Q. The result of this experiment is that you have a vast amount of securities at a very low quotation?—A. No; the quotation has gone up, too. The present quotation for Chicago and Alton 3 per cent bonds is about 92, and there was thirty-two millions of them: call it 90, and you get \$28,800,000. If you take the twenty-two millions of 3½ per cent bonds at, say, 85—

Q. (By Mr. CONGER, interrupting.) Second-mortgage bonds?—A. Well, that is what they amount to, but they are not so called. You see, there are two companies, the Chicago and Alton Railroad Company and the Chicago and Alton Railway Company, which owns the stock of the old company and has issued its own stock. The preferred stock, \$40,000,000, is worth \$75 a share—that is, \$30,000,000. The common stock is selling for \$40—that is, \$16,000,000. There you have a market valuation of \$46,000,000. The Alton road is valued in the market at \$70,000,000. The market value was not to exceed \$45,000,000 when Mr. Harriman got it.

Q. (By Mr. KENNEDY.) What were the bonds then?—A. The capital stock was \$22,000,000, partly common and partly preferred, and the bonded debt \$8,000,000.

Q. That is about \$30,000,000?—A. Yes, in par value, which was valued at something better than \$45,000,000. The capital stock and bonds now amount to \$64,000,000.

Q. Have you a well-defined idea about what it would cost to duplicate that road?—A. I argue from the fact that there is plenty of money available for such enterprises that there is not a good deal of money in duplicating; in other words, another road could not come in there and do very much better than those in existence.

There was a project some three years ago to build a new line from Chicago to St. Louis. There are three lines now, if I remember right—that is, the Alton, the Wabash, and the Illinois Central. There was a project to take a short line called the St. Louis and Northern and extend it into Chicago. That project was backed by some bankers here, and it was killed because the other roads did not want another Chicago line: there was no need for it now. They simply bought it up, and the Alton now owns that. If there was a great deal of money in putting down another line between Chicago and St. Louis to-day I should think that is a very easy way to make money.

Q. You argue that the value of it is not what a line costs, but what it costs to duplicate it?—A. To duplicate it; yes.

Q. It cost not to exceed \$30,000,000 to lay it down in the first place?—A. Yes.

Q. I would like to get an idea what it would cost to duplicate it.—A. I am not competent to pass on that. All I know is, it would cost a great deal more than the original line cost.

Q. (By Mr. CONGER.) The 900 miles of track could be duplicated for much less than \$70,000,000 at the present value?—A. That is, not the Alton road. The Alton road has more mileage than you indicate. What is more, it will take ten years to finish that road. After you get the whole road laid it is not a finished road then. You have to keep on spending money on the road for many years.

Q. On that theory a railroad is never finished, is it, in point of fact?—A. Never; because when you get it done you have got to throw it away and get another one.

Q. Is it not probably a fact that the value of this road—that is, a large portion

of the present market value of it—is in the terminal facilities?—A. Yes. You know that low-priced stock sells higher relatively than a high-priced stock will.

Q. There is a percentage of advance?—A. A big percentage. In other words, if you have 6 per cent income to give away on a stock, you can sell your stocks for a great deal more money by making a 4 per cent stock and a 2 per cent stock than by making a 6 per cent stock, because there is always what the people call "prospects."

Q. I recognize that principle very well; but I think the Standard Oil and the Calumet and Hecla and several other stocks that might be mentioned are sufficient evidence of the fact that stock may be sold at a premium?—A. Certainly; but here is a case where the stock has been issued to about as much as the market will take. It is a case of making a profit; that is all.

Q. (By Mr. RIPLEY.) In view of its being undercapitalized?—A. In view of buying a good thing at a reasonable price. Mr. Harriman bought the Alton road at a 5 per cent basis, and he knew very well that on the present basis of interest account there was a very large profit in it.

Q. Has there been any complaint that that profit was not widely distributed between those who subscribed to the enterprise?—A. I believe the syndicate made a profit of about 16 or 18 per cent. I do not know, but I think it did. I was not in the syndicate, but I think there were other profits that the syndicate did not get. They got all they contracted for, but the mere fact that there were other profits, I suppose, made them feel perhaps that they would like to have had them.

Q. Has there been any account of such profits?—A. It is not usual in such cases to make any profit.

Q. Is the difficulty due in any way to the fact that the finances are not regulated by the State governments? Would it be competent for any State government to regulate the finances of a road? Could a State regulate the financial operation of an interstate road?—A. In what way?

Q. By controlling the amount of issues, or giving assent to leases, or in any way exercising jurisdiction over them. In other words, could a State prevent undue overcapitalization of this road?—A. I do not know that this capitalization of the Alton road is going to have any special effect on the public generally—upon none except those people who buy the stock.

Q. It is unfortunate to the holder of the security?—A. I think the man who buys Chicago and Alton stock at 40 is going to get left.

Q. Ought not the State to protect the investor?—A. It can not do it; he refuses to be protected. The only way you can protect him is to make it a penal offense to gamble on Wall street. He wants to gamble. He thinks he is the man who is going to get the money, and that the other fellow will get left.

Q. You would not advocate any Federal legislation to control or supervise financial operations of this kind?—A. It would be impracticable. I do not think it would be wise to attempt it.

Q. You are aware of the policy of Massachusetts?—A. Yes; it is somewhat similar to the English policy.

Q. Will you state your opinion respecting that policy?—A. I think the English system and the Massachusetts system both are good, very good, but they tend to protect the railroads. Their effect is not to protect the public, but to protect the railroads, because it is practically impossible to get a competing road. All you have to do in England to show that the road should not be built is to show that it would injure the interests of the road already there.

Q. Is not that for the benefit of the community, if there is a sufficient number of roads built to accommodate the people?—A. I think so; I am entirely of that opinion. But that is not the opinion of the shipper; that is not the opinion of the Interstate Commerce Commission.

Q. Is it not the opinion of the railroad commissioners of the State of New York? Have they not lately refused to grant new charters?—A. Yes. I think it is very wise.

Q. Has not that policy been commended, as a whole?—A. I think so. It is a good policy.

Q. If it is a good policy for New York State and Massachusetts and in England, why should it not be a good policy for the United States, making allowance for the need of roads in certain parts of the country, namely, the West?—A. The peculiar thing about the United States has been that it has been run on the theory of protection, whereas England has been run on the theory of free trade; but in England the railroads have been protected, while in the United States the railroad industry has not merely not been protected, but it has been very seriously harassed. The result of it has been that, so far as the production of cheap and good transportation is concerned, the United States leads the world. In England they are

away behind the times in that respect; but I am of the opinion that it would be a very good plan if you had to seek legislation before you could build a road right alongside of another road.

Q. (By Mr. KENNEDY.) How does the capitalization per mile of English roads compare with the capitalization of the American roads and those of other European countries where the government has more control over them than in this country?—A. The capitalization of the roads in Great Britain, if I remember right, is somewhere between \$220,000 and \$240,000 a mile, and ours is about \$61,000. Their roads are capitalized for about four times as much per mile as ours are. I do not know anything about the capitalization of French and German railways, because it is difficult to get figures.

Q. Can you give the reason for that?—A. When the British railroads were completed, along in 1840 and 1850, the land in England was worth a good deal more than here, for one thing, and then you must remember in the capital account of English railways is still included every atom to every man, and everything connected with the early operations of the roads when they started to build the roads, and the English roads have always capitalized everything that could possibly be capitalized since that time, and are still doing it.

Q. If the road was laid with iron rails at the beginning, and now with steel rails, is that old account considered in the capitalization?—A. All the iron is there, and such additional cost as would be involved in putting down steel. If they put a switch box that was not there before, it goes to capital. I asked some English railway managers what their theory was on that point, and one of them made this statement: Whatever sum of money is necessary to make the railroad in perfect condition to-day, no matter what it was before, it is capital account; the result being, of late years, the rate of return of English railway stocks has been falling quite materially. The English railway has got to a point now where they have got to stop swelling the account any more and try to improve their operations.

Q. Do you know anything about dividends that are paid upon the stock of English railroads?—A. Yes; the best English railroads pay dividends ranging from about 5 per cent to 7½ per cent.

Q. On stock representing that large capitalization?—A. Yes.

Q. (By Mr. CONGER.) Usually bonded, are they not?—A. They have debentures, but those are very small. You may take it that their capital stock is about the largest item. I think their debentures and forms of bonded debt do not amount to more than about 30 per cent of the whole.

Q. (By Mr. RIPLEY.) Will you state your opinion respecting the policy in Massachusetts of holding capitalization strictly down to the investment of the road? Are you aware that that is the policy?—A. Yes.

Q. Have you any opinion respecting its applicability to the rest of the country, or what the effect would be if tried by the States, conforming to that policy, or by the United States Government enforcing it?—A. I think it would be a good thing. I do not see any very great objection to it. There might not be so much in the way of commission for bankers, but it would certainly tend to make the value of stocks more stable.

Q. As an example you mentioned some time ago the Kansas City, Pittsburg and Gulf Railroad. Will you state if that is a typical example in the financing of railroads?—A. Yes; the Pittsburg and Gulf road was started by Mr. Stillwell, a man of very sanguine disposition and great energy, and he conceived the idea of building a line direct from Kansas City to the Gulf of Mexico and establishing a deep-water port on Sabine Lake, which he proposed to dredge, and he proposed to put a ship canal from Sabine Pass up to the lake. The reason he took Sabine Pass was because the land there was pretty much owned by the people interested in the road. At a place called Port Arthur it has a depth of 6½ feet, with nothing but mud below. He started in to dredge the ship canal for 11 miles and dredged on this lake. He was able, by dint of hard work, to raise money for the completion of the road, mainly in Amsterdam, and the way he financed it was this: He had a mortgage which permitted him to issue bonds at the rate of \$25,000 a mile for the road, for the main track, and also for yard tracks and terminal tracks. If you remember that point you will see where it comes in presently. All these bonds he sold at whatever he could get for them, generally 65 or 70 cents on the dollar, and he threw in common stock for a like amount as a bonus, and these bonds were dealt in here for, well, somewhere around 60 or 70, and common stock hung around about 10 cents on the dollar. Anyway, the people who took the bonds, many of them, were able to get out, because the bonds had a value; but it was obvious at the start that the property could not carry this rate. They got out. I think, twenty-one millions of bonds before they finally went into bankruptcy. Their mortgage was peculiar in this respect, that it allowed them to issue \$25,000

a mile, not merely for main-track mileage, but if they chose to lay five or six tracks alongside their main track and call it a yard they got \$35,000 a mile of bonds for every mile of that track. And they did build 90 or 100 miles of such yard track, and they issued \$25,000 a mile in bonds on that yard track. All they had to do when they wanted a million or two was to build yard tracks and put out bonds, which they did. The road went into bankruptcy, and is now the Kansas City and Southern, with fixed charges cut down and reorganized, and it has a pretty fair show.

Q. (By Mr. RIPLEY.) There is no body which has supervision over an interstate road of that kind to examine it in advance of its charter and exercise control either over the prospectus or over the affair in any other way?—A. As far as I know, none.

Q. Would it not be an advantage if interstate roads could be under control in that way?—A. Very great. The Interstate Commerce Commission has been operated simply and solely from the other side. It has looked to the interest of the shipper right along, and has restricted and restrained the railroad—has not protected it at all.

Q. The point I was getting at is this: Whether in your judgment it would conduce at all to the security of the investor and to the prevention of costly competition of paralleling of roads for speculative purposes if the Interstate Commerce Commission were to have an extension of its powers corresponding to such supervision as is the case in some States in these matters?—A. I think the Massachusetts railroad law should be enacted in a general sense, or woven into the Interstate Commerce Commission law. The Interstate Commerce Commission law is too one-sided as it is.

Q. Purely in the interests of the public?—A. Purely in the interests of the public.

Q. Without any regard to the investor?—A. Yes; the investor as the owner of a railroad. Certainly, I think that would be a very good thing.

Q. (By Mr. KENNEDY.) What, in your opinion, has been the influence that has been most potent in bringing about the consolidations of railroads which are going on at such a scale in the country now?—A. Really, it was the logical outcome. The movement goes back to the enactment of the interstate-commerce law. When that law was passed the railroads found themselves without what they conceived to be their only source of strength, namely, pooling. As a matter of fact, it was not, but they thought it was, and, as you know, one by one the ground was knocked from underneath on the various other forms of organizations, in place of pooling, and when the Trans-Missouri Association's decision came the last straw was gone, and Mr. C. P. Huntington—who is generally understood to be the inventor or the crystallizer of the community-of-ownership principle—said the only way for the railroads to protect themselves at all and keep things in order and prevent discrimination in rates was for the men who owned them to run them; in other words, for the directors to direct. Now, it has always been the case that a few groups of bankers—very few of them, probably seven or eight—really were in position to control 75 per cent of the important railroad mileage of the United States. You can count up now a list of probably six or seven men or interests that control 100,000 miles of the most important mileage of the country. This is a matter of public knowledge; it is not a matter of record. Now, what these men have done is this: Take the case of the Vanderbilts and the Pennsylvania Railroad Company; some time ago the Vanderbilts and the Pennsylvania Railroad people are supposed to have gotten an agreement affecting the trunk-line situation and the anthracite situation and the soft-coal situation. There was a division of responsibility. The Pennsylvania said, "I will keep everything quiet and orderly in my bailiwick;" and the Vanderbilts said, "We will keep everything quiet in ours." That is what we all suppose took place. At all events, the trunk-line situation has been quiet, and nobody is getting knowledge, and the same is true of the soft-coal situation. It is just this one thing of cutting down business; it is not any effort, necessarily, to control. Now, there have been cases where the control idea has been rendered necessary. For instance, in the case of the Union Pacific. The Union Pacific bought the control of—substantially, I think—the Southern Pacific. Why? Because the Union Pacific was, by nature and by Congress, intended originally to form one line with the Central Pacific, but the owners of the two drifted apart, and this was the first chance they had to put the two together, and the Union Pacific people bought the Southern Pacific road simply and solely for that Central Pacific line to get a clean line through from Omaha to San Francisco.

Q. (By Mr. RIPLEY.) That happened this present year?—A. This last month.

Q. (By Mr. KENNEDY.) Are they likely to get away from the Southern system?—A. They have the means to do so if they want to, and I would not be surprised if they did.

Q. What would that mean?—A. The Central Pacific stock, preferred and common, was deposited as security for the issue of Southern Pacific 4 per cent bonds—twenty-eight millions collateral trust bonds—and those bonds can be called at par and collateral released. Now, the Southern Pacific can undoubtedly, if it so pleases, sell to the Union Pacific the common and preferred stock of the Central Pacific, and thus give the Union Pacific the absolute ownership of the Central Pacific from Ogden to San Francisco, making the line complete.

Q. I take it from your reply to my former question that you believe the Supreme Court of the United States, by its decision in the trans-Missouri case, killed the practice of pooling as a practical question, and forced, in a way, the combinations which have been going on ever since in the railroads?—A. Yes; and I do not think, even if a law were passed allowing the railroads to pool, they would pool. This has been the simplest and safest solution of their trouble; in fact, the only safe solution. None of their associations were of any value. There was always some member kicking and making trouble in it. The combinations were very costly to maintain, and they were always having trouble with them. There was not one of them that worked well, not even the Trunk Line Association. There was a row there half the time. Well, all that is finished. The railroads are directed by their own directors, and these people happen to be the same directors for many of them, the effect being that if a man gets a rate or gives a rebate, and does something he ought not to, he can be reached at once.

Q. This scheme will do away with ruinous competition, and perhaps with the former trouble that brought about receiverships, etc.?—A. It will certainly tend to prevent disturbance of rates. Rates have been more stable in the United States in the last two years than they have been in the last thirty years. I guess there is no question about that. The rate situation has been absolutely peaceful compared with what it was three years ago.

Q. You look upon the community-of-interest consolidation of railroads as a good thing, then?—A. I think the community of ownership, as it is called, whereby the management of these roads is concentrated in a few hands, may in theory be a bad thing, but in practice it would not be found profitable as a bad thing. In other words, if they do not run these railroads on the principle of stability of rates, economy in management, and efficiency in running the machinery, there is no sense in it, and I am positive that that is what they have in mind.

Q. Do you think that the great financial men of the country, half a dozen men, have in mind the absolute ownership of these great railroad systems?—A. I do not think so; I have never seen any evidence of such disposition. I think what they desire above all else is so that the control shall be concentrated, so far as the avoidance of trouble is concerned—the avoidance of fights, rate wars. Now, there is the Burlington road. It is absolutely independent and uncontrollable, and it is outside of everything. It has no affiliations. The Burlington road is a factor in the situation that I suspect will have to be dealt with by purchase. I should not be surprised if the Burlington should be purchased at a high price, too, for the safety of the other roads.

Q. Have you anything to say on the question of Government ownership of railroads?—A. I do not think it would be good for the Government or good for the people. I do not see why the Government should own the railroads at all; I do not see any more reason for it than that the Government should go into the steel business or newspaper business. There is no essential difference between the two things. The manufacture of transportation is just as much an industry as the manufacture of steel.

Q. (By Mr. CONGER.) How far should that regulation go as to rates? Do you think the Interstate Commerce Commission at the present time has sufficient authority over rates?—A. Whether they have had the direct authority or not, I think rates in this country are not merely actually but relatively lower than they are in any other country in the world.

Q. Do you attribute that fact to the authority exercised by the Interstate Commerce Commission?—A. Only in part. I think that nine-tenths of what we regard as harm done by the railroads is due to overbuilding and unwise competition. The Interstate Commerce Commission simply accentuated it and put the dot on the "i."

Q. You said a little while ago that you thought it should be made necessary to seek legislation before a railroad could be paralleled. If a road is to be protected to that extent by the Government, ought not the Government to exercise authority over the rate to protect the public against exorbitant rates?—A. But the commission has been doing that, so far as I understand. I think it has done a good deal in that way.

Q. Do you understand the commission, under the present law and interpretations of the law by the courts, has authority now to reduce rates?—A. No; I do not think

it has final authority to reduce rates, but it has authority to do a great many things which practically bring about a reduction in rates.

Q. Is it not a fact that the authority that was supposed to be given to the commission in the law as originally drawn has in a great measure been taken from it by decisions of the courts?—A. I think so. I think it may be true that the framers of the act intended to give powers to the commission which the law did not directly sanction; but at the same time the question of reduction in rates is a matter that could hardly be final with anybody except the Supreme Court, as I should take it. It is a very serious thing. You can not delegate to a subordinate judicial body the power to name rates over all the railroads of the United States, making it perfectly simple for that body to name any rate it might please and to regulate the whole business.

Q. I do not know that anyone contends for any such authority to fix rates in any sort of way, but I think it is contended that the commission should be given authority to regulate them.—A. The commission can not regulate them without fixing them, and if the Interstate Commerce Commission has authority to say what is a proper rate and what is not, it is a serious matter. It is an authority you can not put in the hands of any body of that character.

Q. (By Mr. KENNEDY.) Has the Interstate Commerce Commission any powers at all, to amount to anything? Has it any powers that the railroads are bound to respect?—A. They have not so many powers as they thought they had and that the railroads feared they had at the start. No, I guess not; I do not think that the Interstate Commerce Commission as an active body is what I should call a very powerful body. I am not familiar with the powers they have. What good influence has it in transportation matters? It has promoted very free discussion of questions. There is one good thing it has done, if it has never done anything else, and it is a matter of great importance, and that is the inauguration of a system of uniform reporting. Their annual reports are very good.

Q. (By Mr. CONGER.) Do you think that power along that line should be extended so as to give them authority not only to prescribe uniform accounts, but also to inspect and audit the books of the railroad companies?—A. That would be pretty much impracticable. They do about all they can be expected to do in their own reports, and if the railroad can be compelled to furnish the figures called for in the Interstate Commerce Commission report, they can not go very far wrong without its being very evident very soon.

Q. Would it not be possible to give them authority to inspect accounts to the end that by the inspection they might detect discriminations in rates, of payments of rebates, and like things?—A. You mean to go down on the railroads without any warning and look over their books to ascertain if they are paying rebates?

Q. Well, possibly.—A. You mean like the bank examiner comes in, suddenly?

Q. Yes.—A. Well, I do not know that there would be any necessity for that, because, as far as can be learned, as far as we know, the payment of rebates is pretty nearly dead.

Q. You think that is a fact?—A. I do.

Q. You think that uniform rates exist now to all shippers alike?—A. In a sense they never did before; to a greater extent than before. I do not think there has ever been a time when the people were getting more even treatment in that respect than now.

Q. Is it or is it not a fact that the notice from the Pennsylvania Railroad Company to Mr. Andrew Carnegie that the rates with which he had been favored in the past were to be discontinued is the primary cause of the present formation of the steel trust? Have you heard that?—A. I have heard that and many other reports. That is not the way I look at it. No; I think the present formation of the steel trust is due simply and solely to Mr. Carnegie's careful plan, his attempt, successfully, to make somebody buy him out. Mr. Carnegie wanted to be bought out, in my opinion.

Q. Pretty long-headed gentleman?—A. He is. He sells out at the top of the boom at top prices; but I always understood that when Mr. Frick had the option he was unable to buy, and that Mr. Carnegie had determined that he should be bought out. I think that was in his mind when he talked about the National Tube Works some two or three months ago, when the matter first became mooted, and I think he has worked to that end simply and solely, and I do not think the Pennsylvania Railroad has had any influence in the matter at all.

Q. Well, that report that the company had notified Mr. Carnegie that the rates that had heretofore existed should not be continued is supposed to be the cause of his threat to move his plant or erect a new plant on the shores of Lake Erie, is it not?—A. Mr. Carnegie has made a good many similar statements at various times in his career, and they had their effect every time, and he may have said such a thing to the Pennsylvania Railroad.

Q. You do not attribute much weight to it?—A. No; I do not.

Q. Regarding the powers and duties of the Interstate Commerce Commission, is it not a fact that the commission is without power to enforce its decision?—A. Yes.

Q. Do you think that that is as it should be, or should the system be changed or corrected? Should the commission be given power to enforce decisions?—A. Is it not true that the railroads have accepted their decisions in a very large majority of cases?

Q. I think, as a matter of fact, it is true they accept in unimportant cases, and when issue is made they do not accept.—A. The way I feel about it is this: That the determination of what is and what is not a reasonable rate is really the one important question of all others, because you can very easily remedy the long and short haul business and the discrimination business. They are not so important. But when it comes to the determination of a reasonable rate I would be very sorry to see that power placed in the hands of any public body. I do not think the Supreme Court of the United States is competent to determine that. The only thing that determines it in the long run is free trade in railroads, free trade in transportation, and you get the reasonable rate fixed by nature.

Q. You would not favor the strengthening of the Interstate Commerce Commission act by making the decisions of the commission operative pending appeal?—A. No.

Q. You think that would be unwise or unjust?—A. Yes; because there is no necessity to have the thing started right off. To make changes of that character is a very serious thing. An appeal can last for months, and if there is any wrong done to anybody, when the appeal is finally passed upon it is a great deal easier to settle with the shipper than it would be to settle with the railroad. In other words, the wrong done to the shipper can be very easily adjusted, but it might be very difficult for the railroad to protect itself.

Q. (By Mr. KENNEDY.) Suppose a multitude of little wrongs are involved which the shippers might not care to urge?—A. It is not those cases they fight about; it is the big ones.

Q. (By Mr. CONGER.) Is it not a fact that under the present custom and practice very often the railroads will put in only a portion of their evidence, if you please, in hearings before the commission, and then, anticipating the decision will be against them, bring on new evidence and carry their cases into the courts, the case then being allowed to run along 2 or 3 years, not only to the great exasperation of the shipper, but sometimes his absolute annihilation?—A. I can see how that might be so, but I do not call to mind any case; I am not very familiar with the legal points involved.

Q. We have had testimony along that line before the commission at Washington.—A. Quite possible.

Q. And the question I was putting to you was whether it might not be advisable to strengthen the interstate-commerce act so as to make the decisions of the commission operative pending appeals. In other words to put the burden upon the railroads to hurry these things up instead of delaying them.—A. You can not hurry the Supreme Court of the United States. The Nebraska maximum-rate law was there—I can not say how long—3 or 4 years. That law authorized a horizontal reduction of about 20 per cent in freight rates, and if that had been going on for 3 years it would be a pretty serious thing for the railroads. It was decided in favor of the railroads when it got to the Supreme Court. Now, you could not hurry the Supreme Court.

Q. (By Mr. KENNEDY.) You spoke a while ago about some one desiring to gamble in Wall street. I want to ask you if that is what is done in the stock exchange with securities of railroad companies?—A. I used the word in a colloquial sense. I should say the majority of the transactions on the New York Stock Exchange represent the purchase of stocks on margin, of sales of stocks on margin.

Q. And in the handling of the stock itself?—A. What I mean to say is, a man has, say, \$1,000 and he thinks he would like to buy 100 shares of stock that costs, say, \$10,000. He can not buy that 100 shares and take it home with him; but he can buy 100 shares and get whatever profit there is in it and be liable for the loss when he goes to sell. That is what I mean by selling in Wall street. People will want to do that as soon as they are able.

Q. Can you give us a little chapter on the stock exchange—on railroad securities in the stock exchange? I presume you are familiar with that question.—A. From what point of view do you mean—the dealing in them?

Q. Yes; what effect speculation has upon the value of them?—A. It has no permanent effect at all. It is a perfectly certain thing that values make prices in the long run, and values mean earning capacity. In other words, earning capacity makes

profits, no matter what the bulls may do or the bankers may do for the time being to manipulate. In the long run values make prices.

Q. If you read that stock is going up 4, 5, or 10 points, or is going down the same number of points, that has really no significance?—A. It may have a great deal of significance, but it don't make the facts. Take Mr. Hill's road. Mr. Hill was the first man in the United States to thoroughly lay bare the principles of transportation and put them in practice, and the result was his road has been a gold mine to those people who have stayed with it from the start, and it works at lower rates to-day than any road up there.

Q. You mean the St. Paul and Great Northern?—A. The Great Northern. It runs at lower rates than others; it is not overcapitalized, and it has been splendidly operated and splendidly built from the start. Now, Mr. Hill's stock has gone up from the basis of about 100 to what is equivalent to-day to about 300. The stock apparently sells for 190, and there have been so many dividends and subscription rates in connection with it that it is really equivalent to 300. I have seen Mr. Hill's stock go down 20 points while that process was going on. It is not at all uncommon for stock to make a movement of that character.

Q. (By Mr. RIPLEY.) From mere sympathy?—A. Yes, or the necessity of the holder. Suppose a large holder of that stock makes a loss some time or other in his business and is compelled to sell out. His necessities will produce a serious decline in price.

Q. (By Mr. KENNEDY.) What consideration is it that determines whether stock shall be listed or put on the exchange or kept off the stock market?—A. The stock exchange has a very good set of rules governing that matter. They are very stringent in their requirements of companies that desire to list securities. They may have to furnish a good deal of information, not merely at the start, but periodically; officers have to examine into their mortgages, generally speaking, supervising them to a very large extent. It is an excellent thing on the part of the stock exchange. The stock exchange means to list nothing that is not reasonably square. A stock listed there must at least be honest, and it must make statements.

Q. (By Mr. CONGER.) The information that is required, I suppose, is of benefit to the investors?—A. Naturally; it is open for the public.

Q. Might it not be wise for the furnishing of that information to be regulated and required by statute?—A. Yes, if you could, but the fact of the matter is that railroads are no longer greatly at fault in the matter of reports. They have improved them vastly in the last few years, and they all seem inclined to do the best they can in that direction. It is no longer a trouble with the railroads; most of their reports are good. I can not call to mind a single important road to-day that does not make a reasonably good report.

Q. If those reports were required by statutes the requirement would then apply to unlisted stocks, would it not?—A. Oh, yes; but the unlisted stocks are somewhat peculiar on the stock exchange. They represent such things as sugar, which is not willing to furnish the information that the listing requires. You see, they have two lists; they have listed and unlisted, and the unlisted is so called because they are not strictly on the list, but are allowed to be dealt in on the floor. Nothing can be dealt in that is not either in the listed or unlisted department. The stock exchange practically says: "If you want to deal in that kind of thing, it is at your own risk."

Q. The point I was trying to get your opinion upon was as to whether it would not be just to the public, in the interest of the public, to have these reports required of all the corporations, so that unlisted stocks would be compelled to report?—A. Those are mostly all industrials. Yes; I am entirely in favor of that. They ought to be compelled to report, the same as railroads.

Q. Do the statutes of the various States at the present time, in your opinion, furnish sufficient information to shareholders? For instance, is a list of the several stockholders in any given case easily obtained?—A. No; there are some cases in this State and in the State of New Jersey where the stockholder can compel the officers of the company to allow him to inspect the stockholders' list; but, in point of practice, if they do not want to show the list, you have got to go down there with officers of the court and have a lot of trouble over it.

Q. That is a privilege every stockholder ought to have, is it not?—A. Undoubtedly.

Q. It is a matter that might well be regulated?—A. In England every corporation is required to file a list of its stockholders at Somerset House, and any holder can go in there and pay a shilling as a fee and find the list.

Q. At any time?—A. At any time.

Q. What objection is raised here in this country to the furnishing of a list of stockholders, if any?—A. As a rule, nobody wants to see them unless there is some fight going on, and then the dominant party naturally objects to giving anything away.

Q. Under present conditions it is possible, is it not, for the dominant party or, we will say, the management of a corporation, to actually continue in control without even itself owning a majority of the shares?—A. Certainly. It is very difficult to change the management of a company under present conditions.

Q. And to make this information accessible to other stockholders would make a change very easy?—A. Certainly.

Q. Is it a fact that the managers of these large corporations, railroads and industrials, object to the requirement proposed on the ground that if it were a requirement it would be possible for a competitor in business to become the owner of a few shares of stock, and thereby get information that would be injurious to the corporation?—A. I had never heard that point raised; but I do not see what value it would have, because I do not see how the mere knowledge of the fact that So-and-so is a stockholder of such and such a railroad is going to especially help a competing railroad to get any information.

Q. (By Mr. KENNEDY.) We have heard that point many times.—A. I do not see that it is of any special value.

Q. (By Mr. CONGER.) It has been testified to before us several times that these privileges of stockholders are now restricted for the benefit of or to protect the interests of the corporation; and one gentleman went so far as to say that it was a common practice on the street for parties desiring information to buy a few shares of stock and then go to the office of the corporation and undertake to demand it, and get it by demanding it, and that such practices as that were considered honorable and justifiable. What would you say on that point?—A. I should say if a stockholder is entitled to go to the office of his company to demand from them information of a character that might be useful to competitors, I do not see how you can prevent the competitor buying stock and exercising those rights. I think it is entirely proper for the managers of a company to refuse an ordinary stockholder information of that character; and I should not consider the stockholders' list would furnish that information. I do not think any stockholder should be allowed to go in and sit down and look over the books of a company. It is not necessary that he should have that privilege. If you are going to give that power, then you need to put into the hands of the managers the power to restrict transfers of stock.

Q. How far do you think the report of the financial affairs of a corporation to stockholders should go? Should it be made in great detail?—A. Corporation reports ought to be made in the greatest possible detail consistent with the interests of the company. It is just possible that a company may not be able to state what, say, the manufacturing profit in its business is, because that might give its competitors a clue; therefore its managers might say "We do not care to state the gross sales; we will simply show you the net profits." But where there is a case of that kind they ought also to come forward with an intelligent audit by experts to show that those profits are profits.

Q. Do you know of any such custom as I have been outlining in my questions, of people going to rival corporations and trying in that way to get information?—A. I should say, my common sense would tell me that such things must have been tried many times. I do not know of any case. I have not had a great deal of experience with industrials.

Q. (By Mr. KENNEDY.) Do you think of anything you would like to volunteer that has not been brought out by the questions?—A. Not at this moment.

(Testimony closed.)

NEW YORK, February 20, 1901.

TESTIMONY OF MR. THOMAS L. GREENE,

Vice-President the Audit Company of New York.

The special subcommission met in the rooms of the Chamber of Commerce, New York, February 20, 1901, at 10.45 a. m., Mr. C. J. Harris presiding. At that time Mr. Thomas L. Greene, vice-president of the Audit Company of New York, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Mr. Greene, will you give us your full name?—A. Thomas L. Greene. I am now the vice-president of the Audit Company of New York, which is an auditing and examining company. If you would like to know, I may say I was brought up as a clerk in the railroad business under my father, who was one of the pioneer managers in olden time, and I was in the railway business in a dozen capacities for a dozen years. In coming to New York I

was engaged for merchants also in transportation matters, was editorial writer for one of the New York papers and for magazines and periodicals for a dozen years, and I have been obliged by my calling to study the business situation and the corporation question. I have written a book on the subject called *Corporation Finance*, which contains, after a fashion, something of a discussion of some of these questions. Although it was written 3 years ago, it has general suggestions on the questions which the commission are considering. I ought to say at the outset I do not speak of any views except my own. I have no right to speak for anybody else, in case the question should come up; and, furthermore, I am not in the employ of any railroad company, or of any banker, and I do not know the particulars or details of any deals that may be going on. I say this because it is both a strength and a weakness to be in this position. I can not give you any information whether one company is going to absorb the other or not; but it is also, on the other hand, an advantage in the sense that it is usually the person who has had close touch in the past with these things who keeps generally informed on the subject. So far as that is concerned, I have some general ideas in my mind on the situation, at least some permanent general ideas.

Q. In your business as an official of an auditing company have you made examinations of financial companies and railroads?—A. I would prefer, if it is agreeable to the commission, to leave the question of the exact examinations of the Audit Company out of the question. I mean by that statement that our relations are so confidential that I can not give you information; it would not be right for me to do so. I would prefer to confine myself to my general information, which has extended over, as I say, more than 30 years' experience.

Q. Were you ever connected with the anthracite coal business?—A. I had cause to study the anthracite situation, the general situation, somewhat closely.

Q. Did I understand you to say that you were connected with the independent producers of anthracite?—A. I was at one time; I represented them at one time.

Q. What was their production, annual production at that time; that is, what was their percentage of the coal business?—A. My recollection is that at that time it was somewhere between 28 per cent and 30 per cent. I would not like to state the exact amount. That was 4 or 5 years ago. It was a very considerable portion of the total coal tonnage, as you see, and at that time a very considerable proportion of the tonnage of one or two of the railroads.

Q. What is the tendency of the anthracite coal trade to-day?—A. The individual operators occupy a peculiar position. They are and have been honest and fair owners of their properties, and they have a right, the same as everybody else has, to conduct their business in their own way, and at the same time they are part of a very great problem in the coal regions, and perhaps before taking up particularly their position it would be well to speak of a few facts about the general situation, if that is agreeable to you. The difficulty in the coal region is that what the college man would call an economic waste is tremendous. It is at the foundation of the problem that our financial people are seeking to solve. The anthracite coal of the United States is confined to a small area in eastern Pennsylvania. I think it is about 400 square miles, but you can find that out from somebody, and in that sense it is of course a natural monopoly. However, the ownership is so cut up by individual holdings and by different railroads that it is most uneconomically handled. I think that that map [referring to map] is approximately correct as to the situation of coal in the Schuylkill and Lehigh regions. Let us say, for example, that coal from those regions will be hauled right past the Wyoming Valley over the mountain. If you know the country there you know the Wyoming Valley coal goes over a pretty high mountain, and will sometimes be hauled over that same mountain back through the Schuylkill regions to tidewater. I cite that as one instance of the great economic waste of transportation power.

Another thing is that the railroads must, of course, have tonnage. They are miners of coal principally to secure transportation of it, because it is by transportation that they get their charges, and it is perfectly proper and fair that it should be so. The result of that system is that the most economic mines are not worked to their full capacity, and that the mines which it costs a great deal more money to work or operate, because they belong to this or that or the other railroad, are operated. Any engineering expert that you choose to call will tell you in technical language, which I can not do, the reason why some of these mines cost certainly as much as 50 cents a ton more than others to operate. It is the same with all mines. Some are on the level, some fill up with water and have to be very expensively pumped, some are very disadvantageously located in various ways. Now, if it were possible to shut up the uneconomic mines and operate to their full extent those which can be operated cheaply; if it were possible to distribute the total around so that the railroads which are entitled to the transportation would get

it—that is to say, if the Wyoming tonnage could be sent one way and the Lehigh and Schuylkill another instead of crossing each other; that the tonnage which now moves on two railroads within 100 miles of each other could be transferred from one to the other—if all this were possible, there is no reasonable doubt in my mind, from conversation with railroad people and with the mining people, extending over a long period of time, that there could be a saving in mining and transportation of \$1 a ton. There is also another saving possible in the way that the coal is distributed to the retailers, and incidentally, I may remark, that there is another saving, possibly, in the way the retail dealers distribute to consumers.

Q. (By Mr. KENNEDY.) Is that saving of \$1 a ton likely to take place when the community of interest is perfected?—A. I was just coming to that. That is a very important point, and I will bear it in mind. There is also an important bearing in it upon the coal trade as a whole in the fact that the governments of the States have not allowed them to combine. Furthermore, the trade as a whole is not economically managed in the sense that a great business should be conducted. It should be played almost, as you might say, figuratively speaking, like a game of chess. The railroads as a whole do not know how much coal is going to one place or another. They do not know, for example, whether Binghamton is using as much coal as Elmira. Now, the great iron companies know where their markets are, and they study them, but such study is impossible in the coal trade, because these companies are not combined. There is no general policy about it. If you will consider all those facts, on economic mining, on economic transportation, the fact they have each of them a large number of selling agents, of subordinates, I mean more particularly who sell coal, it is apparent to you, I think, that this economic waste I spoke of is really very great.

Now comes the question whether that waste could be done away with. I am of the opinion that it can not be entirely done away with without absolute ownership. The community of interest will certainly enable the owners to effect very many economies, but they can not get the full benefit of the situation at all. Let us take a practical illustration: perhaps in that way I may make myself clear to you. The Central of New Jersey and Lehigh Valley roads run alongside of each other for miles and miles. If it were possible to transfer the coal that now passes over one road to the other, that coal could be handled by the other railroad with a very great saving; but, of course, the Central can not afford to have its coal put on the Lehigh Valley unless its owners themselves have an interest in the profits of the Lehigh Valley arising from the transportation. It is impossible, you see. That will do as one illustration of the fact that, in my judgment, the full economies possible in the region can not be had without absolute ownership of some kind, and that, it seems to me, is the real stumbling block in the way of the plans for the real uniting of the properties. If I were the United States Government, if I had anything to do with it, or if I were the State of Pennsylvania, I should consider it to the interest of the community in the long run to absolutely force these people together rather than to compel them to remain apart as the constitution of the State of Pennsylvania now does in this particular case I am talking of now. Let us look at it in this way: If it were possible to save, say, a dollar a ton (I am inclined to say that in the course of time more than that could be saved, but let us take a dollar a ton) the price of coal would be reduced to consumers fifty cents a ton, 25 cents a ton could be taken to pay interest on the additional money which would be required before the one road would be operated instead of the other, and the companies could put together 25 cents a ton for the additional earnings, let us say, on the present capitalization. That would be an ideal situation which everybody would benefit from.

Q. Is that what would take place?—A. Now, then, as to that I have not spoken of the operatives. This 25 cents a ton would leave a fair profit to the companies and allow larger, higher wages for the operatives, you know. Now, as to whether that could take place of course that is a very big question. I have always considered that one way to make lower prices to consumers would be to make greater economy in mining and transporting possible. Certainly as long as everybody is working, as all are now, they will not reduce the price of coal if they can possibly help it, because the whole situation depends on getting a certain amount of profit on it. They would be in much better condition to reduce prices, and be willing to do so if they could in some way save a very large amount in the cost of transportation. Mr. Haddock told you that the price of coal just now is at the highest point for safety. It may be asked what would hinder them if they were combined from putting up the prices. I have no further interest in the question than everybody else. My only interest is that I buy a large number of tons of coal every year for family use. So I am directly interested in that question. I think it would be physically possible for them to put the price of coal

up \$1 a ton or \$2 a ton more for a time, but only for a time. It would be the most reckless proceeding they could possibly undertake in consideration of their own profit, because anthracite coal is to a certain extent a luxury. The competition is extremely severe; the indirect competition is extremely severe at the present time. In a great many cases we here in New York who burn anthracite coal very generally are apt to lose sight of the fact that in Chicago and Western cities they have a better class of bituminous coal which they burn in their grates and furnaces, and only a small proportion indeed of the total coal tonnage that is used in the West is anthracite. There is the competition of oil; there is the competition of gas. The gas companies, as you know, are making as much money in the summer time as in the winter, simply by the introduction of gas ranges, which people find very useful, which can be turned out in hot weather and not have a fire when no fire is needed. Now, over and above all that, there is the question of electricity. It is no use trying to prophesy, because no one can tell, but there is just a bare possibility that sometime in the future there may be for all our great cities a large electric plant, fed by bituminous coal which may supply heating and cooking possibilities to our families. This economy that I spoke of, and which is possible in the anthracite trade, might in the long run—not now—but in the long run, prove to be the salvation of the capital invested in those companies, if something of that kind came about. In other words, they would then be prepared to drop prices a dollar a ton if they had to do so. It may be that competition of that kind may some day come out. The electrical experts can tell you of the possibilities of it better than I can. We are already furnishing it by a plant down town to a certain building. My general proposition is if it could be shown that the coal operators could in this way save a large amount of money, whatever the sum, that they would themselves be compelled by the pressure of public opinion, by pressure of possible competition, in order to forestall that possible competition, to reduce the price of coal to the public, if the savings that I speak of should turn out in the course of time to be realized. I think, therefore, while I have nothing whatever to do with it, that the plans of these people for uniting the companies is in the lines of the best interests of all concerned in the long run. I feel it so as a consumer of coal.

Q. What would be the result if they should unite to the extent of controlling the bituminous fields as thoroughly as they may the anthracite fields?—A. I do not believe that is possible except in localities.

Q. It has been charged that is what they are doing now,—A. They can only do it, in my judgment, to a limited extent, and I will go back to call your attention to the strike in the bituminous trade—we have had a very severe one—3 years ago, where the whole field was supposed to be stopped, and yet from some place, nobody knew where, enough coal kept coming on the market to break the strike. Now, the experts in coal tell me that the whole country, the whole United States, is underlaid with bituminous coal, not anthracite, but bituminous coal, and while there are certain fields where it is more favorably worked from the location of the mines like, for example, in West Virginia, and while it is possible for those fields to be controlled to a certain extent, I do not believe it is possible ever to control the bituminous field or that it ever will be controlled fully to such an extent as to make any appreciable public difference. Mr. Saward was before you the other day. He is now out in his paper with a cry against the bituminous people because the market is getting overstocked. I was reading it here this morning. The main purpose of these people, as I understand it, is to keep up the freight rates and not let them come against each other.

Q. (By Mr. RIPLEY.) Does not that involve holding up the price of coal if the coal is carried on a percentage basis by the railroads? Does not holding up the freight rates imply holding up the price of coal? Is there not a definite relation between the price of coal and the transportation under all of these agreements being made?—A. Unquestionably so. The general idea of a traffic man is that he sits in his office and determines that he will charge 50 cents or 75 cents a ton for coal, something of that kind. Let us take the practice; let us take Chicago. There is a great market for coal all around there, and the price of coal practically in Chicago is fixed by circumstances under no particular individual's control. It depends on the demand for the coal and all that. A man who is traffic manager of a railroad, who runs into Chicago, says "the price of coal is so much, the price of mining is so much, and what proportion between the two shall we get?"

Q. But is that situation true of this particular anthracite coal field, if there be a community of ownership of different roads, and if all individual properties be brought into an agreement for the life of the property to ship for 65 per cent of the tide-water price?—A. I am not sure that I clearly understand what you are getting at, but I would say those possible economies I have been speaking of were dependent more or less on absolute combination, as I said. Now, the community

of interest which the gentleman referred to is of course a step in that direction, and in so far as it is a step it has of course this economy. I do not know just how much economy they will be able to put in force through that plan. For example, they would be utterly unable, with a minority of the stockholders, to transfer the traffic of the New Jersey Central to the Reading. I see in the paper there has been a sale of the Central of New Jersey to the Reading Company.

Q. An absolute sale?—A. An absolute sale of the majority of the Central to the Reading Company.

Q. (By Mr. KENNEDY.) Bituminous coal, as we understand it, is carried at a very much lower rate by the transportation companies than anthracite coal. Is it probable that if this community of interest is brought about or if a consolidation is effected that the price of bituminous will be put up on that account?—A. That is of course the same question in another shape. I do not think it possible to any serious extent. Now, take for example the anthracite trade. Apparently here is a community of interest; apparently there is nothing to prevent their putting the price of anthracite coal up, yet Mr. Haddock, who is in the business, the other day said that the limit has been reached.

Q. You agree with him?—A. I think he is right. I, as a consumer of coal, am perfectly willing to rest on the owners. If they should force me to pay \$2 a ton more and the rest of the consumers and I should put in an apparatus to burn soft coal, or if that would be impossible, to get along with gas or oil or electricity, I would never burn another ton of anthracite coal. They would kill the goose that had laid the golden egg. It is the same reliance in every trade. We rely on one corner grocery to keep down to the prices of the other corner grocery. The same is true with every business, that our main reliance for low prices is on enlightened selfishness.

Q. (By Mr. RIPLEY.) I would like to ask you just a word further respecting that sale of the Central of New Jersey to the Reading Company. You say that the sale was made to a New Jersey corporation?—A. No, a Pennsylvania corporation with special powers.

Q. Not the Philadelphia and Reading Company, which is a Pennsylvania corporation. Will you explain?—A. The laws of the State of Pennsylvania under the constitution, I believe, prohibit the owning of mines by a railroad company. What they did do was to organize the Philadelphia and Reading Railroad Company with capital stock, the Philadelphia and Reading Coal Company with capital stock, and the Reading Company, which owns both of them.

Q. Certainly. Do I understand you now that this sale of the Central of New Jersey has been made to another corporation?—A. No; this same Reading Company that owns the railroads.

Q. That company, then, is a New Jersey corporation?—A. A Pennsylvania corporation, and allowed by its special charter to own the stock of other companies.

Q. And the mining company and the Philadelphia and Reading road is owned by the same company?—A. By the same company.

Q. All of them, however, take their charters from the State?—A. In that sense, but there is this difference, and that is the difficulty in this almost ideal plan that I am speaking of, of community of interest of the coal companies, which would be best for the community at large, that the minority stockholders are in the way. You can not turn the coal, as I said before, of the Central of New Jersey over to the Lehigh Valley, or the Lehigh Valley to the Reading, unless you own that road absolutely.

Q. What would be the remedy for these minority stockholders—the courts?—A. The courts are very jealous of the rights of the minority stockholders.

Q. Can you state any recent case from memory?—A. Yes. Of course it would be far better for you to get the opinion of some practical lawyer. The only case that is in my mind at the moment is what is known as the New York and Putnam Railroad, where the New York Central bought a controlling interest and foreclosed on it, and the courts very nearly upset it on the ground that it was a wrong to the minority stockholders. All this involves technical points which I am not speaking of now, but, as a matter of fact, the courts are getting more and more jealous of the rights of the minority stockholder.

Q. The primary difficulty of absolute consolidation of these interests lies in State legislation and in the situs of the charters.—A. On the general proposition which I am now discussing the State of Pennsylvania, as is true in a great many States, is very much down on monopoly, and there is no greater monopoly in the United States, on the face of it, than the anthracite coal field. There are not any other anthracite coal fields, and some of us are bound by circumstances to burn it; but I think that the only hope for lower coal in the future is through such a combination of interests in the anthracite territory as will allow the owners to produce that coal cheaper, and that can not be done the way the work is done now.

Q. (By Mr. KENNEDY.) Are the public who use anthracite coal paying charges at the present time upon investments made by these railroad and coal mining companies to secure property that will last fifty, sixty, or a hundred years?—A. In some cases, yes. The Reading is a great illustration. I think you had somebody before you who spoke about that. Mr. Gowen, thirty years ago, began the plan of buying up the properties that were contiguous to the railroad. He bought up coal lands that were not used, with the idea of controlling the supply. He bought land that was not worked, and that would not be for a long time, and he tried to get freight rates to support that policy. As everybody knows, he failed. The road was reorganized.

Q. Was that the reason he failed?—A. Undoubtedly the main reason.

Q. Now, have you any idea as to how much a ton the public pays in the way of charges on those lands?—A. Oh, that was thirty years ago I am talking about.

Q. At present on the property they have acquired?—A. They do not pay anything now.

Q. Don't they pay a royalty?—A. It does not make any difference whether you pay a royalty or bond interest to buy the land; there is no difference. If you buy coal lands and work them and put out bonds at interest and it amounts to \$50,000, it makes no practical difference whether you pay that \$50,000 to the owners of bonds or to the owners of the railroads.

Q. What I want to get at is this: Whether these people have not secured a monopoly of coal lands which if they did not hold other people would work, thereby making the price of coal lower and relieving the public from paying charges on their investments?—A. I do not think that that is practically so now; it was when they started out, or that was their idea; but, as I said, they failed. It might possibly be true that if there were 50 roads into that territory and about a hundred different people working those mines that the competition between those people, if such a situation is conceivable, would after a while reduce coal to a small price per ton, but it would only be for a while. They would all go into bankruptcy, and the situation by slow degrees would come around to where we are now.

Q. Do you know what profit the railroad companies have in coal when they get here to the seaboard or tidewater and sell it?—A. No; I do not. It is impossible to tell. The circumstances are so varied. Each road has its own special circumstances.

Q. You could not give an instance?—A. I do not think it would be possible to do so. It is understood, for example, that the Reading mines cost more to operate on the whole than some of the others.

Q. (By Mr. RIPLEY.) That is true of the whole Southern field?—A. It is true of the whole Southern field, the Schuylkill, for instance.

Q. For what reason?—A. It is the general difficulty of working the field, and the condition in which it is. The coal is slightly different. All these different fields have different characteristics of coal.

Q. Do you mean to say, then, that all of the issues of securities originally made for the purchase of those coal lands, in order to hold them, have been squeezed out?—A. Substantially so. The Reading company has been reorganized twice since that time.

Q. Has the effect of that reorganization in each case been to decrease the volume of stock and bonds out?—A. I should have to consult figures before answering that question. That is a matter of record I do not remember; but in any case it has reduced what was at one time absolute fixed charges of the companies to contingent charges; and one of the things these people are trying to do, if it is a possible thing, by this community-of-interest idea, is to pay something on preferred stock, for example, which really represents old bonds that were issued and the holders of which suffered a pecuniary loss through the policy taken at that time, of buying out more property than they could carry.

Q. Do I understand you, then, that one reason for this present attempt is that sufficient earnings may be made to pay interest on this preferred stock, substituted for the old bonds?—A. That I think is a fair statement of the case, generally speaking, of not only the Reading company, but a great many other railroad companies of this United States. The railroad officers I am sure feel a sort of obligation, if it is a possible thing, by fair means, to pay on the preferred stocks of, say, the Atchison and the Union Pacific, and a great many companies of that kind that have been reorganized, because you must not forget that following 1893 25 per cent of the railroad mileage of the United States was in the hands of receivers, and I suppose that 75 per cent was seriously affected, so that 100 per cent suffered.

Q. To go back, then, to this particular question. Is it not possible that the effect of economies resulting from combination might be simply to pay a larger return

upon those securities which have not been profitable, instead of reducing the price of coal?—A. Yes: that might be the case. My general position about that is, if a shoemaker can invent a process by which I can buy my shoes 50 cents cheaper, I am perfectly willing that he should have 10 or 15 cents extra profit. That is the general economic position I think the community is taking. It lies at the bottom of our patent laws.

Q. You will acknowledge, however, that there is a large volume of such securities on which interest is not paid, which are waiting for returns, and that a fair inference might be that economies would yield a return on those old securities rather than reduce the price of coal?—A. You have the general idea that if you can reduce the price of coal; if you can give a little higher price to the operatives and a little dividend on some of these exchange preferred stocks, you have in such a situation a consummation devoutly to be wished.

Q. Is there any agency, however, which, at the present time, represents the public directly to see that it gets that 50 cents or 25 cents?—A. No more than in the case of the corner grocery.

Q. And you think the security is ample in that case?—A. Without at this moment going into the general question, I think in the anthracite case we can rest perfectly sure that the public in the long run will get that benefit. At any rate, it is a question which, in my humble judgment, could not be taken up by legislators at this time.

Q. (By Mr. KENNEDY.) If all the railroads should get into the anthracite coal combination: they are interstate carriers, I believe—would it not be desirable, in view of the possibility of those companies putting on arbitrary rates for carrying and on the price of coal, to have some body like the Interstate Commerce Commission with power to say when the rates are too high and order them lowered?—A. To answer that question, I would like to call your attention to the fact that great consolidations of railroads outside of the anthracite fields are now in process. In my humble judgment, that is a part of the general question. The Interstate Commerce Commission have apparently been waiting for a dozen years to find firm ground on which to plant their feet. I am not sure whether the present developments will not finally lead to just exactly the basis that the Interstate Commerce Commission have been long trying to find.

Q. Just excuse me there a minute. Do you mean the Interstate Commerce Commission particularly or the people in the country who believe in the Interstate Commerce Commission?—A. I mean both together, and it may be that they may now find exactly their right place. I am not at all sure that that is not a good plan. Perhaps it may be. On the general question, it may be well to say that a good many of us are glad on the whole that it is a matter of consolidation and not a matter of pooling, for the reason that the pool keeps things as they are. It simply sustains prices; it is in the nature of what is a real trust, as the Standard Oil was, for example, while consolidation permits economies, and it is only through economies that we can hope for reduction in prices.

There was a rumor in the papers the other day that one large industrial company had bought a railroad. Of course, as we all know, Mr. Carnegie has long owned the road from the lakes to his works. Now, if that road is bought to give his own road low freight rates, and if the Interstate Commerce Commission says, "Make as low rates on your own road as you please, but give the other people the same," we have a situation that is good.

Q. (By Mr. RIPLEY.) It is absolutely essential to that position that the Interstate Commerce Commission have such power?—A. Yes: as to how it should be brought about, that is a technical question I am not going into.

Q. Your proposition would not be practical unless the commission had such power in some way given it?—A. I did not mean by that power necessarily to take the railroads by the throat. That is matter for discussion. But that they should in some way have an even thing. From the point of view of the public I do not see any objection to it. What the railroad people object to is to have the Interstate Commerce Commission tell them what to do: to say to them, "It is law; you must do it;" or what form of contract they should make. That is the general proposition of the railroad people. They do not object to the reasonable scrutiny of the Interstate Commerce Commission or of anybody else.

Q. (By Mr. KENNEDY.) I do not want to get away from the coal. I want to go back to it after a while. But since you touch the question of pooling, I want to ask you if it is not a fact that the consolidation movement which is going on in railroads at the present time is not making the question of pooling an obsolete one?—A. Yes. I was only saying on the whole that we who are simply interested in the general question are rather glad now that the pooling law did not pass, because the railroads have been forced into this position of consolidation.

Q. How have they been forced?—A. By the march of events.

Q. Are you familiar with the labor situation in the anthracite field?—A. No; not in detail. I could not express any opinion about it, except in a general way. I would like to have every man get enough to give him a fair living out of it.

Q. Are you in favor of arbitration of great disputes, like that of last fall in the anthracite field?—A. I am in favor of the principle of arbitration. As to exactly how it should be applied I am not quite certain or clear.

Q. What would you say to a condition brought about like this: Where there are three parties at interest, the mine owners and operators on one side, the miners on the other, and the public; where there is a cessation of work and the public suffers, and one or the other of the two first-mentioned parties is obdurate or stiff-necked and holds out, allowing the public to suffer, they themselves suffering more than anybody else, perhaps, do you believe that under those circumstances there should be some force which would compel the settlement of that difficulty, some legal force?—A. That is a tough question. If settlement could be brought about by the pressure of public opinion, of course that would be the best solution of it. That is not always possible. One solution that has often been suggested is that the labor union should be incorporated and be made responsible parties for their part of the contract, so that when you did make an agreement you would have some body you could deal with. I think everybody that is familiar with the situation is in favor of a union of the labor forces in some way.

Q. You think that as desirable as the union of capital?—A. Yes; they should in some way agree. I think it is also generally admitted that the workman has an ethical right to some consideration by his employer as a matter of business on the part of the employer. It is very difficult to say how that should be brought about. You can not give the business over into the hands of the trade unions. If you do that you have the position they have in Great Britain, where they have practically stopped all improvements in machinery. Where the dividing line should be drawn is a question which I have no offhand opinion on.

Q. You say the labor organizations should have some consideration at the hands of their employers. Do you not think they should have a full and equal voice in fixing the wages and the hours of work and the conditions under which they shall work?—A. I am not sure that the best plan is not a council of persons on both sides, who should discuss these matters without absolute power to fix terms. If the trade unions are wrong and insist upon their demands, they ought not to have their way; and if the employers are wrong and insist upon theirs, they ought not to have their way. Now, which is right is the question. It depends on circumstances. In some places it may be one way, and sometimes it may be the other. I should suggest conciliation, if it is possible, to save the question of arbitration.

Q. (By Mr. RIPLEY.) The statement is frequently made publicly, and has been made before this commission, that the several mining companies mine at a loss, but that they make up that loss by the profit on transportation. Will you say anything, without specifying names, as to the practice in keeping accounts between the railroad and the subsidiary mining company?—A. Why, the accounts ought to be distinct and the companies treated as separate affairs. As a matter of fact it can not be done in that way in the anthracite regions. If you will recollect, I said a moment ago that the railroad companies, in order to get tonnage, operated the mines alongside of their road at a disadvantage of, perhaps, 50 cents a ton, let us say. They are operating the mines at, say, a cost of \$2 per ton in order to get tonnage, while across the river, a mine is operated at \$1.50 a ton.

Q. Does that statement mean that there is an absolute loss; that is to say, that for each ton of coal the wages paid out, the railroad operating expenses, interest charges, etc., amount to more than the price which is credited by the transportation company when it takes the coal?—A. That might be true of some specific collieries. Of course you can not find out, because nobody can get at those accounts. I do not know whether the people themselves know. It might be true of some specific collieries, and I do not doubt that it is true at certain specific times of the year. It is an extremely difficult thing to do, to keep the accounts of a mine; it is exceedingly difficult to keep track of the operating expenses.

Q. Can you specify?—A. There is a certain amount of work at every mine that must be done, what they call dead work, and which has no direct relation to the amount of coal you are going to get out. They must fill out chambers, and make track, which work does not bear directly upon the sale of coal at the mouth of the mine. Now, it is a matter of opinion whether all of that labor should be charged to improvements of the mine or all of it to operating expenses, or half and half.

Q. It seems all of it should be charged to the mine, and not to the railroad?—A. Yes. You are asking, though, whether the mine is profitable. It all depends on what is the proper way to keep the accounts.

Q. (By Mr. C. J. HARRIS.) Do any of the companies take any account of the fact that the mines will be exhausted within a limited time?—A. Very few of

them indeed. In the anthracite field there is an absolute limit to the amount of coal you can get out of it.

Q. Have you ever seen estimates which in your judgment are reliable as to the possible life of the anthracite field at its present rate of production?—A. Oh, the estimates differs greatly. I have been told by the people, I am not an engineer, and can not say of my own knowledge, I have been told by the people that it will vary from 50 to 150 years.

Q. That 150 years would be, perhaps, the maximum?—A. Well, that is general opinion. It is exceedingly difficult to tell how much of the coal there may be. Some of the coal is all good coal, fine coal, and easily mined. Bye and bye we shall get into the more difficult operations, where it will cost more money to mine that coal undoubtedly.

Q. (By Mr. KENNEDY.) Have you any testimony to offer on the anthracite situation that has not been brought out?—A. I do not think so. It would require a discussion of detail, and I think in this particular the time is limited, and it would be well to confine the matter, with your kind permission, to general statements of this kind. Of course these are general statements, and the facts vary in each case, as you will readily understand, according to each railroad and each property.

Q. (By Mr. RIPLEY.) Have you any knowledge, acquired not from particular sources but from the press and other ways, of the nature of the sale of the Pennsylvania Coal Company to the Erie Railroad?—A. No; I only know what the street has said—what has been published in the papers. I take it, however, that it is a part of the same general plan—community of interest.

Q. I refer particularly to the financial method of effecting that purchase.—A. Why, somebody with a whole lot of money had to arrange for it and take the financial responsibility. It is so tremendous a transaction that the ordinary man is lost in it.

Q. You have no statement in that connection that would be useful, without violating any confidence at all?—A. No; I think not. I think it is a step in this community-of-interest idea, which I have just said, to be completely successful should be merged into ownership. It does unite two properties.

Q. Have you a knowledge, acquired from public sources, as to the price that was paid for the securities?—A. Nothing; only what the newspapers have said.

Q. May I ask whether that price, as you remember it, was high, as compared with prices prevailing in previous years? Or, putting it in another way, without specifying any particular company, where these consolidations take place are prices as a rule rather above the average of a long term of years, or not?—A. I should say, on the whole, they are slightly above. Usually the holders of large amounts of stock are unwilling to sell at market prices. Let us take for example the case of the Central of New Jersey. The stock of that company has not been, perhaps, quite as high as the price paid; but that company owns most valuable possibilities, including terminal lands on the Hudson River, which are now unused; and it would be perfectly proper for the owners of that company to say that if they sold out to somebody who could use those facilities they should be allowed for them.

Q. Might it not depend, however, as to the expediency of the price paid, on whether that purchase was made, as is said, at the top of the market—that is, when average prices are high all through the range of public securities—or whether it were made at a period of public depression?—A. Of course the price of stock is an important factor, but the question when the circumstances will allow you to make use of a property is an equally important factor.

Q. The point I wish to get at is this: Whether consolidation effected at a market where a very high range of prices prevails would entail a heavy burden upon the capitalization of that purchase in future years when the business becomes less?—A. That is the business of the financial people to determine; and as they are long experienced in the business, it is fair to assume that they see their way clear to make a profit out of the investment. If I may turn for an illustration from the anthracite field for a moment back to the trolley companies, which is a common case: Two companies are operating in different sections of a city. Somebody comes along and gets an option to buy them out. Maybe the stocks are selling at par. Those people see that by putting them together they will create traffic, and render the stock worth 150. They can well afford to pay 100, what it is worth to the owners, with the idea of getting 150 for it. That is a perfectly legitimate transaction.

Q. Suppose we assume two railroads coming together; assume they can make the stock worth 150 where it was 100 before. Does not that imply that the 50 is going into the pockets of the people effecting the consolidation, instead of the service?—A. If you take it in that way it might be so; but the history of all railroads is that, in spite of it, the public will get the benefit in increased train service. Take the case of the Central of New Jersey. Let us suppose—I do not know anything

about that, but let us assume for a moment that the people wanted a very large place on tide water, where they could handle a large amount of coal. The tide-water facilities of the Central of New Jersey would give them something they never could get without it. Let us assume that for a moment. Now, they could well afford to pay 15 points above the market for such a privilege as that; and that would result in the long run in this very reduction of price that we have been talking about.

Q. (By Mr. C. J. HARRIS.) In the case of most of these recent recapitalizations of coal companies, are they not very largely overcapitalized, in comparison with their real value?—A. I think you will have to ask some stockbroker about that. It is a question what you mean by real value.

Q. I supposed you had in your business actual estimates of the real values of many of these companies, and could give them without going into details.—A. There is no such thing as "actual value," considering these companies.

Q. There ought to be, ought there not?—A. No; it is impossible, if you mean by actual value the reproduction of the roadbed and the cars, etc. It would require a very accurate examination, and no one would have a right to an opinion without an examination. I question whether you can build a road into the anthracite field for less money now.

Q. The intent of the question is to determine what price should be charged for a certain commodity. The question of the value of the plant and of the company's interest on it would also have to be taken into consideration, would it not?—A. I do not think so. I do not think that the value of the plant is a consideration for the legislature. I do not think that it is a very important consideration for the investor, and perhaps I may be talking hearsay, but I think if the legislatures would keep in mind the investor they would help to solve a great many of the problems of the consumer. In other words, if a man is going to rob the community, let us say, by coal or freight or whatever else, he does it with the object of making money; and undoubtedly the only way he can make money is by unloading that stock on the public at high prices. Now, if you can have a statement or some means, by examination of the affairs of that company, that show its great earnings are on a false basis, and destroy the possibility of that man selling his stock at an exorbitant price to the investor, you kill the motive.

Q. Suppose the cost of the railroad is fairly represented by its bonded indebtedness. It has besides its bonds large amounts of preferred and common stock. Now, then, in the making of its rates of freight, what proportion should be given to preferred and to common stock, which has no standing, you might say?—A. I do not think that that, if you will allow me, is a correct statement of the industrial situation.

Q. If you will excuse me, that has been taken into consideration by the Interstate Commerce Commission.—A. I am aware of it, and think they made a very serious mistake.

Q. Why so, if you please?—A. I am familiar with a great many businesses. I have had occasion to know something about them, not only recently, but extending over a number of years. I find it is the universal opinion of people making large investments that, considering the risks of their business, if they can not make 12 or 13 per cent on the actual investment, they would better lend out their money on bond or mortgage and go out of business, and let somebody else take it that can do it. That is the general situation among all the industries of the country. Take a mill: A man that can not make 12 per cent on the cost of the mill would better go out of business. That is the general condition of the community. Now, if you ask that man to come to New York to arrange for a corporation to take over his mills, he wants to issue bonds and stock. What can he issue bonds for? Only for the value of his mill. What shall he do with the rest of his earning capacity? He has got to issue stock for it. You are forced into this condition: Here is the mill, worth \$100,000; it is earning \$12,000. He can not issue bonds for more than \$100,000, and 6 per cent on that is \$6,000. What shall he do with the other? Issue common stock on it. There is no other way to do it. In the judgment of the majority of the financial people that is a perfectly legitimate transaction. Nobody is deceived. The mill is legitimately earning \$6,000 over the face of its bonds. The only way to do this is to put bonds on for \$100,000, and stocks for \$100,000 more. Of course that stock is called water, but I do not think that is a correct term to apply to it. That is a capitalization of the earning capacity of the mill, which is represented in our financial scheme by common stock. Whoever receives common stock finds written all over it the contingent value of that property. It is a perfectly legitimate transaction. The only thing is, like everything else, when a man goes to organize that mill he may put \$200,000 on it, owing to the difficulty of valuing it and the ease with which formerly any amount of stock could be put on it. You can not do it now.

Q. The price in the market, I suppose, would regulate that?—A. You can not do that in Wall street to-day.

Q. (By Mr. CONGER.) Would it not be possible to issue all stocks and no bonds?—A. Oh, certainly; but there is an economic difference. You can borrow money at 4 or 5 per cent if you are earning, say, 6 per cent on \$200,000 and your stockholder is getting 6 per cent dividend. Now, if you can turn around and issue \$100,000 at 4 per cent, your stock is getting 8 per cent, don't you see? In other words, the financial point is that there are two classes of people in the community—one which wants a safe investment and is willing to take a low interest; the other wants more, but is willing to take a little risk.

Q. In financing these corporations, both industrials and railroads, do the present laws, in your opinion, sufficiently protect investors as regards the representations that may be made or that should be made in the prospectuses of these concerns?—A. On the whole, no. I do not know that they do. As a matter of fact, Wall street has had some bitter experiences lately, and there is a much greater protection in the conservatism of Wall street than there is in the law.

Q. Can you cite an example of one of these experiences that you mention that Wall street has had?—A. I think it would be better to let it go as a general statement, if you do not mind, because some of these things I would not want to refer to particularly. I need only ask you to look at the quotations of some of the industrial stocks that were floated in 1899.

Q. (By Mr. KENNEDY.) You made a comparison between what Wall street is doing and what the law is doing?—A. I meant by that that it was a very difficult thing now in Wall street to form an industrial combination, let us say, except on the most conservative lines; so that while the law does not protect the investor any more now than it did two years ago, you can not get a banking house in Wall street to issue an uncertain security. The banking houses won't do it, and the investor would not buy it. Therefore there is more protection just now than through the law.

Q. You mean to say that the States which have branched out liberally in their laws in imitation of New Jersey receive no comfort and support from Wall street now, do you?—A. No. There is no complaint about the laws of New Jersey that I know of. The rule is, "Let the buyer beware."

Q. (By Mr. CONGER.) Now, touching those laws of New Jersey for a moment, inasmuch as you have spoken of them, do you think the rights of the individual shareholder there are sufficiently protected?—A. In this sense, as I say, you are notified that you must beware of the matter. There is no pretense to keep the people from buying common stock when they ought not to, or anything of that sort.

Q. Under the laws of New Jersey, at the present time, under which the corporations are organized, is it not possible for the management of a corporation, being in the saddle, so to speak, to so continue without actually holding a majority of the stock?—A. Not when anybody wants to turn them out; no.

Q. Are there any regulations or methods by which a stockholder can learn all the names and addresses of the several stockholders—can learn who they are?—A. I believe so. It is hedged about, you know. The difficulty is that somebody will buy a few shares of stock in order to make trouble for them. At least that is what they are afraid of. The genuine stockholder can generally get all the information he wants. What the corporations are afraid of is the man who, from ulterior purposes, buys up stock and then asks for the books in order to create sentiment against them.

Q. It is customary for these large corporations, just before the annual election, to send out blank proxies all over the country, is it not?—A. Yes; they are absolutely dependent on that system for an election.

Q. Do you know whether the lists of any of these corporations can be seen by any other shareholder than the officers?—A. I would refer you to some of these companies' lawyers for it, the exact legal situation; but a legitimate stockholder can get a reasonable amount of information if he goes the right way about it.

Q. (By Mr. RIPLEY.) Including the names of the other stockholders? That is the vital point.—A. I won't express an opinion on that point, as I am not a lawyer. Last year there was introduced into the State legislature of New York a law, which it is understood was prepared in a measure by Professor Jenks of your commission, and which was intended to cover that point, that there should be an office kept where the stockholders' books should be kept on view.

Q. (By Mr. CONGER.) My question was to lead up to that one—whether your experience would lead you to favor the enactment of some legal requirement by which a shareholder should have the right, upon demand, to have the use of a list of his fellow shareholders?—A. There are a number of instances in New York State in which the corporations which are themselves shareholders are apparently not

treated well. Perhaps it would be well if we could have a recast of the corporation laws so as to cover not only that point you speak of, but a number of others, some of them for and some of them against the corporations. This bill of a year ago was intended to allow the corporations to do honestly and legitimately what, for example, they can not now do, provided they would make a clean breast of what they were doing. That was the gist of the bill. It was the old idea of publicity through an examination of the affairs of the company by qualified experts.

Q. (By Mr. RIPLEY.) You speak of the laws of New York prohibiting the holding of stock of one corporation by another.—A. That is the way I understand it.

Q. Such holding, however, is permitted in the laws of New Jersey, and is the essence of the anthracite coal financial situation?—A. Certainly.

Q. Would that be true of Pennsylvania also?—A. I am not qualified to speak. I do not know the laws of Pennsylvania; but I think not.

Q. (By Mr. KENNEDY.) Is it true that the transfer books and lists of stockholders and other books of these great New Jersey corporations, which are supposed to be in the offices in New Jersey, and should be there under the law of New Jersey, are actually in New York City?—A. No; they are over in New Jersey.

Q. Is it not true, or is it true, that at one time they were not there, and when an investigation was supposed to be under way great express wagonloads of them were taken from New York and put in those temporary offices in New Jersey?—A. I do not know about that. Most of the corporations I know of are law abiding. They have their records and offices in New Jersey. Some of them have directors there. I know that special cases have arisen, under the old condition of things, where they held the corporation's books there. I mean they had small offices; the clerks are not there, you understand, but enough of the corporation machinery is there to satisfy the law. The president has to be where the business is going on—in New York City, you know—but the stock books are usually kept in New Jersey, and so far as I know the corporations do carry out the law faithfully. I never knew anything to the contrary.

Q. (By Mr. RIPLEY.) Do you know of some that have been lax in that matter?—A. No; I do not.

Q. (By Mr. CONGER.) You said a few moments ago that you thought the legislatures should look out for the interests of the investors, and in that way they would be serving the consumer as a rule. Would you think it an unreasonable requirement that the names and addresses of the shareholders in a corporation should be provided for the use of all members before an annual election?—A. I don't think there would be so much objection to that requirement if you would couple with it other conditions which a corporation desires. In other words, you have taken just one point in a very big corporation question. The way to do that, in my judgment, would be to recast—if you are speaking, for example, of New York City—all of the corporation laws; not only that, but other things.

Q. What other things?—A. Holding of stock, for instance. I believe you have a process to get at the stock books of corporations in New York.

Q. Is it not practically impossible under the New Jersey laws for stockholders out of harmony with the management of a corporation to learn of the holdings of other members in that corporation to the end that they might put up another ticket for officers and directors?—A. I have had the people speak to me about that matter a number of times. They have always, I think, without exception told me that a bona fide stockholder could go into the office and get all the information he wants, but they do not want Smith, Jones, or Brown to get a list and put up a game by which he would have to be bought out at the cost of a number of thousands of dollars. Now, if you can devise a scheme by which a stockholder can get all the information he ought to have and so the speculator can not take an advantage of it, I think that is all you can ask for, and I think every corporation will immediately accede to it.

Q. Do you think the purpose or intention of the man who is a bona fide shareholder should be taken into consideration when he applies for a list of his fellow shareholders?—A. Certainly; there is the difficulty. I may be wrong about it, but as a matter of fact, officers of corporations have again and again stated to me on that subject that the people who desire to look at their books and make a row about their affairs are the people who do not own any stock, according to the records. There are a great many people in the city of New York who make a business of going around and trying to obstruct something or other, by reason of which obstruction they shall be bought off. Obstruction is considered in Wall street a legitimate thing if it can be done fairly. The right should be hedged so that it is not possible for speculators to take advantage of it. That is the crux of the whole controversy.

Q. As to the financial reports of the different corporations, do you think that those are made in sufficient detail at the present time to the shareholders? In other words, how far into detail should financial reports of corporations be made to the members thereof?—A. That is a question on which I have been obliged to give a good deal of thought. Practically, my experience is that when a partnership is turned into a corporation it does not lose at all its business position. It has changed its form, but its business position is the same as before. But nobody asks a partnership to give undue information. Just the moment, however, it becomes a corporation information is asked for. Men do not wish to give away their secrets any more under those conditions than they do when in a partnership. There is the conflicting situation. A railroad is quite different. It does not make any difference what the New York Central shows in its accounts; nobody is going to build a road alongside of it. But an ordinary small corporation is put to a serious disadvantage by showing what its sales are and what it earns, that somebody around the corner can use to his advantage. It has once or twice been the case that the Audit Company of New York has examined the affairs of these corporations, and certified that the earnings have been so much, without giving details. That has been suggested once or twice as a way out of that difficulty. The people then would believe the earnings were fair, that is to say, would have confidence in the statement; and, on the other hand, there would not be a statement of all the secrets of the corporation. The Pressed Steel Car Company is an instance immediately in point, which has just been issuing its bonds on such a statement.

Q. Is it or is it not a fact that charges are frequently made to assets that should go to operating expenses?—A. It sometimes is the case.

Q. Is that, in your opinion, done at times with honest intent, or in ignorance, or sometimes with fraudulent intent?—A. I am very glad you asked the question, I am glad to bear testimony from practical experience to the fact that the great majority of the people, as merchants and traders, in this country are honest. I am glad to make that statement. They are honest. They differ slightly among themselves as to what their profit is. That is the difference. They very often, with the best intentions, but in ignorance, make statements which are not, commercially speaking, correct, but which they honestly believe.

Q. These mistakes in bookkeeping then are frequently made in ignorance rather than with fraudulent intent?—A. Yes. The result to the investor is the same. There is a saying in Wall street that they do not know which is worse, a knave or a fool. A knave they can guard against; but the fool—they believe his statements because he is honest.

Q. You spoke of the inspection of accounts. How far would you favor governmental inspection of accounts of railroads?—A. I should rather not favor the examination of accounts of railroads by the Government itself.

Q. Why not?—A. Because the inspection would have to be made by a bureau, and there would be a suspicion of politics in it, and various things like that. My own opinion would be that public opinion, if possible, should force the railroads not merely to an audit, but to an examination—more than an audit—by some disinterested party who was an expert in the different lines, and whose name should be filed at Washington, with a bond, let us say, and who should do other business besides that.

Q. Do you think this political flavor you object to now attaches to governmental inspection of national banks?—A. No; but the case is different. In the first place the banks are not examined to the extent that we are speaking of with respect to the railroads. There is a misapprehension in the minds of a great many people that the banks are really examined by the examiner. It is not so. It is not his business to detect thieves. Of course if he can find them out incidentally, he does it. His business is to see that the law is not violated—to protect the depositors.

Q. Is it not a fact that he does inspect national banks to the end that he may know that the assets that they claim to be there are there?—A. Certainly; but those assets would have been, say, \$50,000 more if somebody had not robbed the bank.

Q. Would you favor the inspection of accounts of railroads by the Government to the extent that national banks are inspected?—A. I think not, because it can just as well be done in another way, and to the avoidance of trouble. The Government would of course employ the best people. It is the same idea as the stock exchange. Once in a while there is a movement to ask the stock exchange to examine the properties that are listed there, but it is not the stock exchange's business to pass upon the solvency of corporations; it can not be possible.

Q. You say it could be done in another way. How could it be done?—A. By having persons, specialists in their line, to examine those railroads. We are doing it all the while, and no suspicion attaches to our examination.

Q. Is your audit company engaged to inspect the accounts of corporations at regular intervals?—A. *Certainly. Sometimes one corporation is inspected every month, another one is every six months, another one every four*

Q. And does the certificate of your company have a recognized financial standing in Wall street?—A. It is incorporated in financial underwritings on the street to the extent of millions of dollars.

Q. You would favor this private auditing of accounts of those corporations by private auditing companies like yours rather than by the Government?—A. That would be the idea, hedged about by anything you please of course—by penalty in a bond, if you like, or whatever penalty that be required, because I think the possibility of losing money is, after all, the best safeguard.

Q. The Interstate Commerce Commission now has the right or prerogative, and I think exercises it, of prescribing the method of keeping the accounts of railroads.—A. Oh, yes; but that does not insure the accuracy of the accounts. It is a very good idea, and has done excellent service to the community by bringing the railroads to a uniform basis. I think everybody appreciates it.

Q. Now, in the absence of this system of auditing accounts by these private audit companies such as yours, would the inspection and auditing of these accounts be desirable, particularly if it were confined to the quasi public corporations like railroads?—A. I should rather prefer, if there was to be a law on the subject, that a report of some corporation, let us say like the Audit Company of New York, should be filed with the Interstate Commerce Commission for example, certified—any prescription as to the information, or something of that kind, to be obtained from the commission; and let the Audit Company of New York, as I say, file a bond or anything you like with the Interstate Commerce Commission for the faithful performance of those duties. I do not believe in increasing the Governmental machinery unless there is some real advantage in so doing.

Q. If this system of auditing accounts by private audit companies like yours should become general, naturally competition would grow up, would it not, between rival audit companies?—A. Unquestionably.

Q. Is it not a fact, or is it not presumable, that if the accounts of railroads were to be inspected by the Government, uniformity in the accounts would probably be a result through such Governmental inspection, while that uniformity would not naturally be secured from the auditing by separate and different audit companies?—A. On the contrary, I think the uniformity of the present Interstate Commerce Commission would be adhered to by everybody, and carried through; in other words, in the classification of accounts, my idea is that the Interstate Commerce Commission would control.

Q. You would not favor the enlargement of that Bureau to the point of inspecting?—A. No; I would not; because the accounts are so delicate that the service requires somebody conversant with the Street. For instance, what is solvency? Who is going to answer the question?

Q. (By Mr. RIPLEY.) Can you give an example showing the difficulty of answering that question—a hypothetical case?—A. I have in mind a company in the West—manufacturing company—who, let us say, did not make a dollar, but had a great many more current assets than liabilities. Should you consider that they were solvent or insolvent? There was a dispute about the question, as I happen to know, on that very point. There is no question at all in my mind that they were perfectly solvent. A man is solvent as long as he can pay his debts, whether he is making any money or not. I only instance that as a question that came up. That requires persons to be most carefully in touch, not only with the business to know what it really is—not the commercial situation alone, but the Wall Street situation, for, after all, all these things run into finance sooner or later.

Q. (By Mr. CONGER.) The Government inspectors of national banks have so far been able to satisfactorily determine whether a bank is solvent, have they not?—A. It is an easy matter; anybody can do that. I do not mean to say the work is not hard, but the theory is easy.

Q. You mean to say the bank's assets are in money and they do not have to believe any deception?—A. Oh, no. We have examined a great many banks, and our examinations go very far beyond what any bank examiner's does. That is no reflection on the examiners, however, for they are not hired to do what we do.

Q. How far would you carry the legal requirement of inspection—to what class of corporations?—A. I think that perhaps the United States Government should limit itself, until the question is put in another shape, to the corporations you spoke of—the transportation companies. This law that your own expert, as I see according to the public report, had something to do with, required that the corporations of the State of New York should come under it and should also be

audited. His idea was publicity. The idea of that law was to give the corporations a chance to do legitimately what they would have to go to New Jersey to do now, at the same time giving them the power to show their hands.

Q. You think the laws of New York should be revised so that one corporation could hold stock in another corporation?—A. The opinion here is that the laws of New York should be revised on several points; that is one of them.

Q. Is it a fact that the laws of Massachusetts prohibit a corporation organized under its laws from holding stock in another corporation organized under its laws?—A. Yes. The laws of New Jersey, Delaware, and West Virginia do allow such holdings. (Give the corporations a chance to do anything, if you only know what they are doing. That is the whole secret of the business.

Q. (By Mr. RIPLEY.) You have spoken of the Interstate Commerce Commission's accounts. Does the publicity they enforce, and the uniformity, apply to any other branch of the accounts of railroads except the income account? That is, is it quite uniform in the several departments of railroad finance?—A. You can not get the detailed information; that is given to the commission, and they hold it privately.

Q. But do they secure, as far as you know, such detailed information as was contemplated in the origin of the Interstate Commerce Commission?—A. I do not really know about that. They do not give out all the information—only the substance of it. I do not know what they get.

Q. I would like to ask you to make perfectly clear the difference between an audit and an examination.—A. An audit is an examination of the books as they stand. That is a very important thing. It must be done by special experienced experts, because it is the foundation of all knowledge. You must know what they have been doing. But there is still a further thing behind the audit—that is, whether the figures represent the commercial facts. I do not know whether that expression is very clear to you, but what I mean is this: Take one instance. It is not customary for a railroad company to set up what we call the depreciation account, but it is customary in factories. The railroad is supposed to renew enough equipment in every year to keep itself going just as long as it needs any such thing. I do not myself think that is the best course, but it is the custom. That is all we can say about it. Now, the railroad company, if it should by any chance wish to make large earnings, can simply stop repairing cars, and practically that information, so far as the audit is concerned, would be to that extent misleading. Now, nothing but the examination of the affairs of the company outside of the books would show its condition, because the books would be correct. The most dangerous set of books I ever saw in my life were absolutely correct, but they did not represent the facts. There are practically two subdivisions in this matter: One is the books themselves, so that the information of those books shall be correctly recorded, and that is not at all a simple matter; and beyond that there is such a thing as an examination of the affairs, so that the report will represent the facts behind it.

Q. Do I understand you to say the bank examiners do nothing practically in the way of auditing?—A. I did not mean to say that. I really think the public clamor against examiners is hard on them, and they do a great deal of that sort of work, undoubtedly.

Q. (By Mr. CONGER.) Early in the testimony you said that as a consumer of coal you had no objection to and, as I remember, practically approved of the consolidation of the anthracite interests that is now going on?—A. Yes.

Q. Now, what is your opinion of the necessity, or lack of necessity, of Government inspection of accounts of that combination if it should be formed? Do you think there is any need of it?—A. I think that the whole railroad situation would be made better by such an examination. I really think if there is anything behind the combination they want to conceal, it ought to be known. But as far as I am familiar with their affairs I think there is nothing in them that they really need be ashamed of—nothing except some little instances that happened, but I do not think there is anything of consequence they ought not to reveal. Therefore I agree that it would be better in some way to be known either directly or through some general act of Congress, which should give to the Interstate Commerce Commission the power to have these companies audited by outside auditors, who should file bonds with them, leaving them in their charge. For example, that might be possible, and I think it would be better for the coal companies just the same as the other companies to do that.

Q. Now, we have pending in the industrial world at the present time the organization of a mammoth steel trust. Do you think that government examinations of the accounts of a corporation of that magnitude would be advisable?—A. It is a gigantic undertaking to examine a company like that. It is not hard either when

you think about it, because the constituent companies are to be kept alive. In that case, as I understand it, it becomes a question of examining a certain number of constituent companies.

Q. We frequently hear publicity advocated as a remedy for the trust evils. Do you agree with others in advocating publicity as a remedy?—A. As a general fact, I do. The question as to how much publicity and covering what points, of course, is a matter that might be discussed, but in general, I think that the publicity of the essential facts would not hurt.

Q. In the term "essential facts" I suppose you would include profits made, would you not?—A. I would, certainly.

Q. To the end that, if the profits were exorbitant or very large, if that term would be preferable, competition might be thereby encouraged?—A. Precisely so, only I think a number of years ought to be covered. Now it may sound strangely to you, but it is a fact in my own knowledge that the panic of 1893 did not affect manufacturers in this country until two or three years afterwards, and the worst years our manufacturers ever had were 1896 and 1897, and not 1894. Rather strange fact, is it not?

Q. How do you account for that?—A. Panics are financial and they only reach business afterwards. It takes time for a panic in Wall street to reach the Western manufacturers. Now, then, if you are considering the enormous profits of the steel companies for the year 1900 or the year 1899, you ought in fairness to take into account the loss of 1896 and 1897 or lack of profits, whatever it may be. Now, if all those facts can be set in a group and if the companies are wrong, the people can find out the fact. But on the whole they are right and fair as a rule in their methods, and I believe in the long run the American people will deal justly with them. I believe in the fairness of the American people.

Q. Do you think the Federal Government or the State governments should undertake the inspection of the accounts of these corporations?—A. Not directly. I think if they provide for inspection it would be all they should do just now.

Q. But you do think they should provide for it?—A. It would be fair to do it if they could have changes and rely on them—for example, the change of the laws of the State of New York. Now, the law of the State of Pennsylvania was well intended, but just now it is the stumbling block in the way of a reduction in the price of coal.

Q. You refer to the constitutional provision of Pennsylvania against railroad companies owning coal land?—A. Yes; but at the present time we are making history so fast that we have gotten away beyond that.

Q. Some have advocated a Federal incorporation law. What have you to say on that point?—A. I think the first thing to do is to straighten out the States on the question of corporations.

Q. Do you think that the incorporation of these companies should be done under State statutes rather than Federal statutes?—A. That is a very large question.

Q. Well, we are getting some very large corporations, you know.—A. Some persons have really advocated Federal corporations simply to escape State laws which are unreasonably severe. They do not advocate Federal laws that I know of on any other ground than to escape some of the arbitrary laws of some of the States in which they are compelled to do business.

Q. Might not uniformity be a desirable object?—A. Yes. It is a question simply—a constitutional one—whether it is in strict accordance with the theory of our Government that Federal authority should step in, even under the guise of interstate commerce, and charter companies inside of individual States. I do not like to go beyond myself in thinking about the question of home rule if I can help it.

Q. Is it not a fact that these large industrial corporations, as a rule, are organized in New Jersey, and many of them operate nothing in New Jersey except an office in an 8 by 10 room?—A. Certainly; but they have to do business in different States.

Q. True; but in what way do the States have the advantage of home rule while this New Jersey scheme is operating that they would not have in operating under the Federal system?—A. Well, the Federal statute raises a series of general questions, you know, which do not apply as between one State and another. But I have really no opinion on that.

Q. Going back to the matter that was mentioned early in the testimony in regard to some of the experiences which Wall street had passed through with some of these industrial corporations, should there be greater regulation as to representations that are made in the prospectuses put out when these companies are organized?—A. That might very well be if the whole corporation law is recast. The stock ledger and various things ought to be considered.

Q. If that were to be done, what would you suggest as some desirable features to incorporate in that law?—A. You know the English law is on that subject that the men who put prospectuses out are responsible for the statements financially. They are responsible now theoretically under our law for any statement made; but in England the responsibility is specific and direct.

Q. Would you favor making it more specific, as does the English law?—A. Yes; on the ground that if, as I say, the whole corporation question is taken up in that broad and liberal spirit, something of that kind might do. You hear a great deal of talk nowadays about making directors responsible. It is impossible. You know if we did that, we would not have many directors. They can not be responsible for what might happen two years from now, so that would be a fact to be very carefully guarded.

Q. Do you think, under the present line of prospectuses that are issued and put out, that they go into sufficient detail as to the powers, authority, and duties that are imposed upon officers and directors of the corporation to be organized?—A. The powers and duties of the officers are not of so much account with an investor as are the other matters. Now, we are slowly minimizing and working out that problem in New York on Wall street without legislation. In other words, a banking house that should continue to put out wrong prospectus would not continue in business very long. We are working that out so it is not really as necessary now as it was twenty years ago, because we are simply working it out for ourselves. I think that the bankers would welcome a reasonable provision in that respect.

Q. How is that problem being worked out—by force of public opinion or rules being adopted on the street?—A. If Smith, Jones & Robinson are my banking house, and they bring out a corporation or a manufactory and issue bonds, and I buy the bonds of that concern and it goes to pieces, we are not likely to buy any more bonds from that house.

Q. It is done by public opinion?—A. By public opinion, certainly.

Q. Are there any rules?—A. They are judged by their success.

Q. Are there any written rules laid down by Wall street?—A. No; excepting that the information must be given. The difficulty about making rules is that they vary in each case. It is very difficult to set down rules. You want to know essential facts in each case. In one case the question may be whether the plants are worth anything, and in the next whether the patents are worth anything, and in the next whether the company has any hold upon the raw material. It is impossible to put down fixed rules for such a thing. It depends on the company itself.

Q. I was wondering whether the rules of the Stock Exchange made any requirements that might or should be enacted into law.—A. That is a case where they are going on without law. They require the furnishing of a specific amount of information in the Stock Exchange.

Q. Might not it be well for the statutes to make the same requirements?—A. I do not think anybody in Wall street would object to a reasonable provision on that point. They say that law is a crystallization of the opinions of a community. Wall street already has an opinion on that subject, so I do not think they would object to the crystallization of it.

Q. (By Mr. C. J. HARRIS.) Does the Stock Exchange require an audit of accounts of companies represented there?—A. No; but it requires certificates of an audit company as to the precise information furnished at the time of listing, but not afterwards.

Q. Would it not be a good idea to have it every year?—A. That is a question brought up every year. The objection is that the Stock Exchange is not anything but a body formed to make trading easy. It is not a body to fix the value of things. That must be done by the members who trade there.

Q. (By Mr. KENNEDY.) Is it all legitimate trading that is done there?—A. That is a hard question. May I ask what you mean by legitimate?

Q. Actual buying of stock.—A. Oh, yes; the moment they catch a man bucketing he is turned right out. Oh, yes; they are most rigid about that; they are themselves most rigid chasers down of bucket shops. Of course, you understand what I mean by bucket shops—places where there is no buying and selling. If you lose so much money you might just as well bet on a card table. They turn right out those who do that.

Q. It is the buying and selling of stock that is the representative of the actual material thing?—A. Oh, yes; no doubt; they are very careful about that.

Q. (By Mr. C. J. HARRIS.) Are you familiar with the recent railroad combination which controls the Pacific Railroads?—A. Only what I have seen in the papers.

Q. Does it control all lines to the Pacific coast?—A. No, not at all; the Atchison, Northern Pacific, and Great Northern are all separate.

Q. Suppose this combination goes on indefinitely; will that lead to monopoly, as you mentioned, in the anthracite coal business?—A. It might very well do so. I anticipate this movement of consolidation of railroads will continue. I do not think we have at all seen the end of it.

Q. What will be the result on the public, the shipping and traveling public, the people who live along those lines?—A. I think it is in the direction of progress. I think before we get any reduction of freight rates we must have economies which will enable those reductions to be made without impairing the earning power of capital. That is what we are all striving for. I do not myself have any fear of the future about that. In fact, the next generation can deal with it if it is necessary; at present I have no fear. I think anything that would enable the New York Central to do business more cheaply will benefit Utica, for example, that can not get out any other way.

Q. Well, so far as the combination has gone, do you find in your experience that this combination tends to reduce prices to the consumer, or does it tend, as was suggested here by you a few minutes ago, to pay more dividends on more classes of stock?—A. Well, the reason for these combinations is selfish. It is the hope of profit that makes the world go round, and if these people did not think they were going to make some sort of profit on them they never would go into combinations, even though the result might be a benefit to the community in the long run. Now, the first effect of a combination of railroads might be to steady the tariffs. You understand there is a good deal of rate cutting going on. They quote 15 cents a hundred where really they get 10 cents of a large shipper. The effect of a combination of large companies would first of all be to steady and make uniform rates which would prevent the uneven and rapid fall in freight rates which has been going on in the last twenty years. It can not prevent a gradual fall of rates, because circumstances are such that commerce in this country is out for low rates, for example, on exports. Now, there is a tremendous field which this country will have to more or less occupy in the future. To do so they will have to have low rates.

(At 10.45 a. m., February 21, 1901, Mr. Greene was recalled as a witness and testified as follows:)

The WITNESS. Before answering any question that the commission may like to put to me, I would like to state that by some mischance I have been radically misquoted in the papers, and as the matter does me considerable injustice, and is in some cases directly opposite to what my sentiments are, I would like to put before the commission some corrections of some of the misstatements.

(The witness here submitted corrections of newspaper accounts.)

Q. (By Mr. KENNEDY.) Is that the only statement you have to make?—A. That is all.

Q. I desire to ask you 8 or 10 other questions on transportation before you go on to the subject of industrial combination. In the first place, I would like to ask you why, generally speaking, railroads give lower rates for exports than for domestic shipments?—A. I do not wish to take the time of the commission to go into the whole question of the relation of exported merchandise to home merchandise except to say that exports have a very important relation to the prosperity of the country. Where, as in our own country, the production is at the moment or may be at any time in excess of home consumption, those exports must be sold abroad or the men must be discharged, for example, and the community lose the benefit of that production and the railroads the carriage of that freight. Therefore, it is considered legitimate to sell those goods at a lower price abroad than in the home market, within reasonable limits, or for the railroads to carry them at a less price. That is not a new idea, because a company that manufactures in New York, if it has a surplus of goods on hand, will sell them at a less price in Chicago than in New York. It is not confined to different countries, by any means. It is a condition of things that prevails at times in every city of the United States, and, so far as my experience goes, it does no practical harm because it continues for a very short time. It is an evil, but I do not think it needs to be corrected by legislation; it corrects itself. I am only speaking now of the importance, as I understand it, of the question of exports. I may add also, if it is in line with your question, that the question of the cheapness of production of these exports and the cheapness of carriage is a most important element in what, so far as one can see, is the coming circumstance of business in the United States. We have before us a possibility of manufacture and of trade which is so great that one almost hesitates to consider it possible, particularly with reference to foreign trade.

Q. Is this practice of American railroads with respect to exports somewhat analogous to the export duty of foreign governments, on sugar for instance, and other products; export bounty, I mean?—A. I suppose that is bound up in the

whole general question of protection, which I would rather not discuss. It is too big a subject.

Q. (By Mr. C. J. HARRIS.) Are you familiar with the import rates in here?—A. I have not been for three or four years.

Q. That is, rates by which goods are shipped from England into interior points of this country for perhaps even less than the prevailing rate from New York City to those interior points?—A. That is a most difficult question and there is no consensus of opinion as to the right and wrong of it ethically. The railroads consider that they are at liberty to take freight, let us say, from Liverpool to Chicago by way of New York, at a rate that will enable them to get the business away from the road from Liverpool to Chicago by way of Montreal. In order to do that they take it at a less rate than is made from, say, Warsaw to Chicago. As a practical question the tendency of the times is always to reduce the domestic rate toward that foreign rate.

Q. The duty of the railroad to the shippers plainly demands that they shall give the same rate to all, does it not, that there should be no variation?—A. Under the same circumstances. The question is, of course, whether the circumstances are the same.

Q. When the rate is less than it would be if shipped directly from New York, there is a discrimination that is hardly just.—A. Not exactly; not in the sense of the interstate commerce law. There the proportion of the through rate is not considered. The Lake Shore road will take a less proportion of the rate from Chicago than it will from Rochester, let us say, or some place of that sort. That is not considered a discrimination. It is the total of the rates that the interstate-commerce law takes notice of. If the rate from Liverpool to Chicago is less than the rate from New York to Chicago, it is a question. The tendency is to reduce the domestic rate toward the foreign rate. It is a difficult ethical question.

Q. (By Mr. KENNEDY.) In line with my former question, I would like to ask you whether the railroads in making these cheaper export rates are a great instrumentality in keeping the balance of trade in favor of this country?—A. There is no doubt about it. This possibility of great trade expansion that is before the United States would be greatly helped or greatly hindered. I will say greatly helped, by the fact that these large industrial combinations will be enabled to produce goods more cheaply and that the large railroads will be able to carry that freight more cheaply.

Q. Will not the railroads themselves thus enable the manufacturers to undersell European manufacturers in their own market? Are they not at the same time promoting foreign immigration to this country?—A. I should say so; yes. I think that the prosperity of this country is the direct reason for immigration. In fact, immigration statistics prove it. There was a great falling off under the panic of 1893, when business was poor.

Q. I would like to ask you whether, when the community-of-interest plan in railroads shall be carried to a successful conclusion, it will eliminate the expensive ticket offices on Broadway and whether it will effect other economies?—A. No doubt something of that kind would be the result. How far that result would take effect from community of interest is just a mere matter of guesswork. But if the time should ever come when community of interest itself should give way in its turn to an absolute combination of the different roads, there is no doubt that the changes in the employment of various railroad officers of the different grades would be very serious. The industrial combination has already decreased the number of traveling salesmen, and there is no doubt the same effect, if it should ever come to that, would be the result in any railroad combination also. I would call the attention of the commission to the fact that while in the industrial world we have had actual combination in regard to absolute ownership of plants, that absolute ownership has only extended in a small way as yet in the railroad world.

Q. Would you care to say anything about the principle of the long and short haul? That was not discussed yesterday, I believe.—A. Oh, I think not. I think the railroad men acknowledge, as a general thing, the justice of that principle. It is only the applicability of it in certain cases that is at times discussed. I think the general principle is acknowledged to be correct.

Q. I should like to bring up the question of classification, and ask you if community of interest would tend to bring about uniform classification, and whether that is desirable or not?—A. I should say the tendency would be that way, but the difficulty is the situation is so different. For example, in the South it is theoretically all right, but practically a very complicated matter, indeed. In making the classification the difficulty of the situation is that we sometimes forget that classification is only another method of fixing rates. If sugar, for example, is carried for 10 cents and you put cotton in the same class as sugar, it must be carried for 10

cents. Cotton goods may be, under stress of circumstances, carried for one rate from New York and for another from Atlanta. There is the difficulty in the classification.

Q. The tendency is toward uniformity, is it not?—A. The tendency is, as the country settles down, toward a regular basis throughout the whole country; but as long as there is a diversity of circumstances there is difficulty.

Q. I would like to ask you if the very largely increased earnings of railroads which we hear about from time to time are the result altogether of good times, or have the better methods in the management of railroads had anything to do with the change?—A. If we compare the earnings and other statistics of railroads with the statistics of the same companies before 1893, let us say, for example, there is an enormous difference. The railroads know how to run their business very much better. They have learned a lesson. My father used to say that the man who did not learn by experience was a dull scholar; and the railroads have been compelled to learn how to increase train loads in a way that 10 years ago was thought impossible. So that undoubtedly the two elements enter into the present prosperity of the railroads. One is that the country is prosperous and freight is being shipped; the other is that they know more about business.

Q. (By Mr. C. J. HARRIS.) What do you say of the low bond rates as affecting the prosperity of the railroads?—A. The question before was on the earnings from operation—the question of what remains for the shareholders. Now, of course, that share is increased by the fact that the railroads can borrow money at low rates of interest, because what is saved in interest is added to the surplus over fixed charges, which goes to the shareholders.

Q. What would you say was the rate of interest on the bonded debts of railroads now as compared with 1890?—A. It is not possible for me to make a fair comparison, but it is certainly not more than two-thirds. It is practically a 7-per-cent basis as compared with a 4, let us say. You can ascertain that for yourselves. The old bonds, for example, of the Chicago, Milwaukee and St. Paul Railroad bear 7 per cent. The bonds of the New York Central system bear something over 7 per cent. They can be refunded now at 3½ per cent.

Q. (By Mr. RIPLEY.) You stated yesterday, did you not, that some degree of earnings should be the basis of capitalization?—A. Yes. I would like to put that thus: That it is taken to be the basis of capitalization.

Q. And seems to be a fairly good working basis?—A. Yes.

Q. In your judgment, then, does a decrease of operating expenses, with the same gross volume of business, justify a corresponding increase in capitalization?—A. I have a very strong opinion on that general subject which may be at variance, however, with that of the community. I think it is a great deal better for a road to pay high dividends than it is for it to water its stock.

Q. Will you state your reason?—A. I do not mean "water its stock," but increase its capitalization, because in Wall street it is considered legitimate to make the two correspond. The sentiment of the community is against high dividends. Therefore, in order to cover that, the people who manage these affairs have thought that they are compelled to increase the capitalization so as to make the rate of dividends about the same as before. But as a matter of public interest, however, I think it would be better to increase the dividends, because then they could fall back. If you increase the capitalization and pay 1 per cent and then fall back, then there is trouble.

Q. A road has a certain volume of business; it preserves that same volume of business, we will say, at the same rate, but is able by economy of operation to reduce very largely its expenses, consequently the net returns become larger. Would it seem to you that that increase of net return would justify a corresponding increase of capitalization, or is a portion of that increase of net return the just portion of the public, which they should receive through a reduction of the rates?—A. It is not a question of abstract reasoning; it is a question of fact. The first result of an increase of that description is that the net earnings of the company are larger, and if they can increase their dividends for the time being it is better to do so, because the inevitable tendency of things is to share that increase with the public.

Q. What is going to insure that sharing of economics with the public unless there be some governmental jurisdiction?—A. That again is a very large question. My private opinion is that the public will share in the benefit of that in the long run.

Q. Would the possible combination of a great number of competing lines possibly change that situation?—A. Maybe. Let us suppose there is a combination of different railroads, so that the expenses of these roads are reduced. Not merely a community of interest; but let us suppose—a preposterous thing—the New York

Central, the Pennsylvania, the Erie, and the Delaware, Lackawanna and Western all combine in a big combination. Let us suppose the aggregate earnings of these companies are increased one-third on the total volume of business. Let us suppose this great steel combination goes through, and they turn around and produce goods very cheaply and send them abroad. What is the result? The result is that they begin to send the goods abroad in great quantities and ask the railroads to ship them and they take them. The local industry will say, You are giving the exporters great advantages. Why can't you give them to us? First they will say no, and then will say yes. The result is the gradual falling in the rates toward the level fixed by the cheapest of all. If that was not the result all history would be against us. I give you that as a case.

Q. In other words, do you mean that the growth of great industrial combinations, coexistent with the growth of great railroad combinations, is going to stand as a safeguard against each other?—A. In the long run; not immediately. The managers of these enterprises are business men. They are after profits, just the same as anybody else is. I am only speaking of the inevitable tendency of these things in the long run.

Q. (By Mr. KENNEDY.) What effect will industrial combinations having the power to prevent overproduction and the railroads aiding in the exportation of our surplus product have, if intelligently and properly used, in averting hard times?—A. A very great influence. It probably has not escaped the attention of the commission that one reason why we have hard times in the United States is because the energy of the American people carries them at times beyond the line of prudence. In other words, if we were a phlegmatic and stagnant sort of people, we would not have such panics. Now, any power or any force which can hold back the American people and keep their energy within bounds will have a very strong tendency to prevent panics—at least to the extent that we have seen them heretofore. My own idea is we will not again see a panic of the intensity of the panic of 1893 for that very great reason, because of the evolution and because of our greater knowledge of what produces these panics. So long as the American people are so progressive there will always be good and bad times. We all have the faults of our virtues, you know.

Q. Have you anything to say about the penalty that is now imposed upon the railroads for giving rebates—the railroad officials—and would you suggest any change in the interstate-commerce law in that respect?—A. No; I do not know that I have any suggestions to make just at the moment. The railroad people who are to appear before you can give you a better idea from their experience, perhaps, and better suggestions than I can.

Q. You could not say whether you think good results would come from changing the penalty from the officials of the railroad to the corporation itself?—A. The railroad men with whom I have talked think it would be a good thing to do that. Generally speaking, I am in favor of a penalty upon the corporation; but I think that these combinations, with the help of the Interstate Commerce Commission possibly, in some way will reduce that evil to such an extent that the rebate question will not be a burning one.

Q. (By Mr. RIPLEY.) Is it true that the principal reorganizations of railroads seem to come in periods—together?—A. Oh, yes. They are dependent on the fluctuations in business the same as any other business concerns.

Q. Can you state any general relationship between such a period of reorganization—frequent reorganization—and the depression and the prosperity of business which falls in with this largely?—A. I should say that they were intimately connected, and that the same reasons that would bankrupt a number of concerns in a manufacturing business would make hard times for the railroads that carry their product.

Q. As a rule, do the railroads with a heavy capitalization seem to be more subject to reorganization than those which operate on a narrower basis?—A. It all depends on the volume and stability of business. The New York Central is capitalized almost as heavily as the average English railroads, but that does not prevent it from being very secure. But a smaller road with one-third the capitalization might be dangerous. It all depends on the situation of the company and the kind and volume of the business it carries.

Q. Have the principal reorganizations of the past 5 years, such, for example, as the Southern Railroad, the Richmond Terminal, the Wisconsin Central, the Baltimore and Ohio, etc.—have they, as a rule, resulted in cutting down the volume of the common stock or preferred stock or bonds?—A. They have, as a rule, I should say, resulted in cutting down the bonded indebtedness beyond a doubt; but in quite a number of cases they have resulted in an increase in the stock in the sense of preferred shares being put ahead of common stock as a sort of semiobligation of the company.

Q. In other words, the total volume of stock plus bonds has not been cut down, as a rule, by such reorganizations?—A. Probably not.

Q. From a financial point of view does that seem desirable or is it merely a necessary result of the circumstances?—A. It is a necessary result of the circumstances, not an evil, for the reason that the bondholders are creditors of the company and the stockholders are partners. So that, from the point of view from which you are speaking, I should say the duplication of stock is not so serious a question as would be the duplication of bonds.

Q. I understand you to say, then, that the possibility of issuing new bonds at a lower rate of interest is the principal advantage that follows from such reorganization?—A. And the exchange of your bonds into preferred stock, which, while it has no legal claim upon the earnings, has a moral or ethical claim on the prosperity of that company, if such prosperity should come from the prosperity of the country at large.

Q. Is it not true that a good many of the reorganizations, or rather of the financial difficulties which have made reorganization necessary, have been the result of rather excessive issues of securities?—A. Undoubtedly.

Q. Is it not, then, anomalous that the remedy applied for the evil of excessive capitalization should be a still further increase of such issues?—A. No; because the safety is in the change in the kind of obligation.

Q. It is not an evil, then, in your judgment, to any degree?—A. I did not say to any degree.

Q. The volume is not as important as the character of the securities?—A. No. It is important that the stock should be fairly representative of the earning capacity of the company, but that is not as important as that the bonds or loans of the company should be within a reasonable limit, because that means bankruptcy.

Q. By whom is reorganization of these properties usually undertaken: by self-constituted or by official committees? Will you explain?—A. The usual way is for the large bondholders who are affected to get together and decide who they will get in. It looks on the face of it as if it were a self-constituted committee, but if you will examine into it you will find it is largely the result of efforts of people who either own the securities in question or who control them, as you say in Wall street. Perhaps it is somebody who is known as a competent man, and has the confidence of someone else, and can get the securities from that somebody else. They very often act in connection with a friendly receiver. I mean friendly in the sense of not an enemy to the interests of all concerned. They get together and state the situation. They find out what the road can do: where, by casting off certain branch lines or taking on others, they can in the long run increase the earning capacity in case of a return to good times, and where they can get the money. That is a very important question. All these things are taken together. It is a very onerous task, indeed. They have to decide on what bonds should be scaled down and what bonds should be exchanged for preferred stock in equitable proportion.

Q. Is reorganization always undertaken in that spirit, or is it possible for a bare majority of the favored security holders to so administer affairs through a reorganization committee that the minority stockholders can be injured thereby?—A. Practically, no. The stockholders are very rarely in question. It is the creditors, and there is always a large proportion of the minority who are willing to carry the case to the courts. A reorganization is not a foreclosure in the sense that a foreclosure on my house is such. It depends on the practical good will of a vast number of persons concerned. It is a practical matter; there is very little opportunity to do gross injustice.

Q. You suggested in your testimony yesterday, didn't you, a disposition on the part of the courts to extend the protection thrown around the minority stockholders?—A. I think there is such a tendency.

Q. Would you suggest any change in the law of corporations which would seek to do that, not by recourse to the courts but more directly by statute?—A. I should say not. The prominent corporation lawyers are somewhat alarmed about this tendency that I speak of. Perhaps the most recent case is that of the Monon Railroad, where the reorganization of that property was almost upset by the courts on the ground that a combination of bondholders and shareholders before the foreclosure was a wrong to the general creditors of the company. Now, the theory upon which American transportation interests are conducted is that, upon the whole, justice in the long run is secured by having the majority rule. There is no other way to conduct affairs. These corporation lawyers are all disturbed at this tendency. Therefore I should say the tendency itself is enough without helping it—without any further legislation.

Q. Will you speak concerning the effect of many of these reorganizations upon the community?—A. That is a very important question. The railroad enters into our

business life to such an enormous extent that anything that would diminish the capacity of the railroad to do business well and cheaply would be a loss to the community as a whole. Therefore the courts have always, in my judgment, wisely determined that the first thing to do was to preserve the public service of the railroads, which would be lost if a system is made up of half a dozen roads with all kinds of different obligations. If each little road should carry its own little train of cars, it is unquestionable that the service of the roads as a whole would be seriously impaired. Courts endeavor to keep all these together practically until the different interests have a chance to figure out a compromise.

Q. Is it not true that in many of the most important reorganizations large numbers of systems have been cut off? I refer, for instance, to the San Francisco branch of the Atchafalaya, Topeka and Santa Fe Railroad and its relation to the main line of that road. Or a better example would be the Baltimore and Ohio and the Baltimore and Ohio Southwestern. Was not that cut off?—A. No; it was taken right into the system entirely. It was a separate railroad; now it is to be taken into the system. The only effect of the Baltimore and Ohio deal is to make a system out of what was a community of interests.

Q. You do not recall, then, any example of a reorganization which has been effected only by cutting off important parts of the system?—A. They do not cut off important parts. Some branches are feeders and some are suckers, and the object of a reorganization is to retain all the feeders and cut off the suckers.

Q. But the reorganization committee determines which is a feeder and which is a sucker?—A. That is true.

Q. And might not ownership by members of that committee in the several feeders and suckers, as individual interests, operate sometimes to cause injustice?—A. Undoubtedly the ownership is a factor. If a very powerful house should own the bonds of a branch road or control them, the reorganization committee would think twice before they cut that road off.

Q. Can you suggest any remedy for that difficulty?—A. I do not think so; any more than it would be the business of the State of New York to save a corner grocery from bankruptcy if the other man got better canned peas than he did.

Q. Have the courts thrown any protection around the minority holders of securities in such branch lines?—A. Oh, certainly. The minority holders, if they wish to come before the courts, have a perfectly fair way. In fact, the conduct of the courts throughout all these trying times of receiverships, and through this new idea of friendly receiverships has been in that direction. In speaking of friendly receiverships, I refer to cases where the managers of the road take pains to see that someone is put in as receiver who is not inimical to their interests. Anyone can see that that practice, which has grown up lately, may be subject to great abuse. It is to the honor of the courts of this country that there is little complaint of practical injustice or anything of that sort arising from these circumstances. I think the best men acknowledge it and appreciate this fact.

Q. Suppose that the volume of securities, through the incident of reorganization, to be largely increased, the quotations from these securities in the market will show lower, will they not, by reason of the increase in volume?—A. Yes; but not proportionately. I think it is the greatest argument in favor of what in common talk we mean by stock watering that there is.

Q. (By Mr. RIPLEY.) Will you state a little more in detail respecting that point?—A. Suppose a company is paying 10 per cent on its stock. That stock at par of \$100 is worth 150 in the market. Now, they double the shares paying 5 per cent; those stocks may sell for \$90 apiece, or, let us say, 180 instead of 150. There is, therefore, effected by doubling of that stock an absolute increase in the selling value of, let us say, 20 or 25 points. Now, here is a pretty curious state of things, which is that the public have got their mind on the rate of interest.

Q. You would not, then, attribute the condition so much to any financial arithmetic as you would to human nature?—A. That is all. It is psychological, and being psychological, there would seem to be no way of curing it. I might call your attention to that very same thing that is going on in conservative England.

Q. You refer to the railroads?—A. The railroads, I mean.

Q. And does not this decrease in the value of securities, even though it be not commensurate with the increase in volume—does that not invite control for speculative purposes?—A. To a certain extent; yes. I consider that overcapitalization has a great many incident evils, and if there is any possible way in which by the sentiment of the community it could be checked I think it wise and well to have that sentiment, but I do not know how it can be done by legislation.

Q. (By Mr. KENNEDY.) You said a while ago that you were opposed to Government ownership of railroads. Would you care to state your reasons for your opposition to that position?—A. No, I do not think it is advisable under any consideration. I think the management would be too political and would tend to

stop this fall of rates which is going on all around us, and which probably will continue.

Q. (By Mr. JENKS.) Your connection with the auditing business has made you familiar, I suppose, with the methods of carrying on the business of large industrial corporations, as with the railroads?—A. Somewhat so.

Q. I want to ask some questions particularly with reference to their capitalization in connection with what has been said. I suppose that the chief reason, perhaps, why corporations are considered more an advantageous form of business than partnerships is because the liability of the owners is limited strictly?—A. That is the essence of it.

Q. Would you say it should be a fundamental principle of a corporation organization in business that instead of the unlimited liability of the partners there should be invariably the liability by some fund in a corporation that has a fixed and ascertainable value always?—A. I think perhaps I could get at your meaning better if you would state it in the form of an illustration. Of course all property is subject to the debts, and the plant and what we call tangible assets are always subject to the debts of the corporation.

Q. Now, do you think that the capitalization should be such that the value of this property could be fixed and ascertained practically regularly at all times?—A. I think as a matter of policy that it would be well if corporation accounts were divided into actual values and good will. I have in a number of cases advocated it. I think it has a good effect in Wall street, because incidentally of course I am a believer in good will as a fair asset of a company if it is accurately valued.

Q. Do you think that the good will should appear in the capital at all unless that good will has been paid for?—A. It must be paid for if the company—if you will allow me to repeat an illustration I made yesterday in regard to a mill. I said yesterday that business men think that they ought to get at least 12 per cent upon their capital; that if they only get 5 or 6 per cent on their capital they might better get out of business and loan money on bonds and mortgages. They consider 12 per cent as the minimum return, and a great many of them get 35. In a hazardous business 25 per cent is not too much. Now, if a mill is worth \$100,000 and the owner only gets \$12,000 a year out of it, if he should sell that mill to any one of the combinations, how would that property be represented in the capitalization of the new company? The usual way, and it seems to me the only way, is to issue bonds or preferred stock, as the case may be, to the amount of \$100,000, on which, let us say, 6 per cent is to be paid, making \$6,000, and then on this common stock have \$100,000 to represent the other value of that plant. Then in that case if you were presenting it you would say: Plant, \$100,000; good will, \$100,000, and on the opposite side, bonds or preferred stock, \$100,000, common stock, representing the good will, \$100,000. Then there would be a perfectly clear proposition.

Q. You would say, then, that it is in the interest of the public regularly that this distinction be made clear between the actual and the tangible assets?—A. That is my personal opinion. I am not in accord with some people in Wall street on that question.

Q. Suppose that a company, by virtue of careful management of its business, contrived to make very high profits—we will say 25, 30, or 40 per cent—for a series of years. In the making of the statements in any way there, do you think you could distinguish between the good will, or profits made on good will or anything of that kind, and those based on tangible assets?—A. The distinction could be made if the people were willing to do it.

Q. May I ask you to indicate how far that should be done in the accounting?—A. The easiest way is to have the property appraised. Then you would have property, so much; accounts receivable, so much; cash, so much; material on hand, so much, and the total of what we call in Wall street tangible property, and that could be very well represented by one-half in bonds, because the bonds ought to represent the plant only; one-half in preferred stock, which would represent the current assets, and then the good will for the difference. But that, however, I ought to say frankly, is an academic question. I mean by that expression that Wall street is not yet ready to take it up.

Q. Suppose it becomes a practical question for the investor frequently?—A. It does, indeed, and it is with an eye to the investor that I am making this suggestion; and, as I said yesterday, if the public bodies would keep an eye on the investor a little more, and on the shipper a little less, they would, in the long run, reach the consumer, which is the same, for the reason that a wicked and unscrupulous man could squeeze a property to get extraordinary profits for the time being only, which he knows can not continue, that he may sell his interests in that property to some Wall street investor at higher than actual value. That is what you mean, is it not?

Q. In making up the annual report, then, you do not think that any very high earnings of that kind ought in any way to be represented by an increase in the capital on the books, by increase in the value of property as such, the tangible assets, at all?—A. That is my general opinion, but as a matter of fact, of course the fact that people always think they are being swindled if a corporation pays more than 6 per cent, and the further fact that an increase in capitalization does not increase the selling value, are too powerful usually for theory.

Q. Another question: In the capitalization of a plant, would you favor including the cost of promotion in any way?—A. The cost of promotion under the theory I am speaking of usually comes up after they all get through. Ordinarily these things are done too much in a hurry to figure out all these questions first, and we usually put them in one account—cost of property. Mark the words, "cost of property." That is the difference practically between the known assets on the one side and the total liabilities on the other. It is called "the dump account." Now, after that is on the books, then the property may be appraised, and that "cost of property" may be divided between the actual property and the good will. That disposes of that question, because the cost of promotion would go to good will.

Q. Do you think in the interest of investors it would be wise regularly at the time of the organization of the company to distinguish between good will, as you have practically defined it, and the cost of promotion?—A. I think that is the proper thing to do.

Q. But that is not the custom?—A. It is not always the custom, but some companies do it. A good illustration is the American Cotton Oil Company. Their property is divided there clearly between appraised value and good will—clearly.

Q. And is the item of cost of promotion put in also separately?—A. It must be if the appraisal is made properly.

Q. Included in the other, but is it appraised separately?—A. No.

Q. You yourself are inclined to think it would be wise to have that stated separately?—A. I did not mention that. I meant if the capitalization is properly and fairly accounted for on the one side then the difference between the value of the plants and the tangible assets can go into good will altogether, whatever it may be, the cost of promotion, the expense of organization, or anything else it may be.

Q. This good will that comes before the tangible assets is very frequently estimated in accordance with the profits that have been made from the business for a series of years before it was really taken over and put in—is it not?—A. Yes; and also upon the probability of business in the future.

Q. Now, this item of the cost of promotion, the pay of the promoter himself, and the pay of the underwriter, and so on, is something entirely different from that. He only seems to recognize earning capacity, and you are really capitalizing earning capacity?—A. That is what it amounts to.

Q. When it comes to the reckoning in of the cost of promotion, however, that does not seem to be capitalizing earning capacity, does it?—A. Generally; and as a practical matter the cost of promotion, the earning capacity—that is, the limit of the capitalization—is first fixed, and then the cost of promotion is taken out of that. As a matter of fact this theory does not always work that way, but that is what they try to do.

Q. In the case of the larger industrial combinations could you give the commission any idea as to the percentage of the capitalization as reckoned out? I do not suppose there is any regular rule to offer for this cost of promotion?—A. There is no percentage charge about it. The promoter goes around and gets the property for whatever price he can fix upon, and then it is capitalized at whatever the Wall street people are willing to take it for, and the difference, less the expense, is his profit. That is all that could be said about it, so far as promotion is concerned.

Q. In reference to the price of underwriters in that same connection?—A. The underwriting is usually considered as a part of the organization expense, and it eventually goes into good will; but those companies that are conservative make a separate statement of this organization expense and write them off by degrees.

Q. In the promotion of these newer and larger corporations, particularly those that are combinations of others, when the public is invited to invest in the shares, would you favor the issue of prospectuses in every case, giving in reasonable detail the conditions of the business?—A. Theoretically, yes. Everybody should have the information, and, according to the English laws, they have that over there, and perhaps if we had had that law here twenty years ago it would have been a great help to us and it might have saved us a good deal of trouble; but as it is now we have worked out our own salvation to an extent, so that the reputable banking house which brings out a combination has so much business interest in it that it is almost a better safeguard than a general law could give, because the banking companies must descend to particulars, and the difficulty of the case is that no general

law can be drawn which will specify what information is necessary in each one of these companies. Sometimes it is one thing and sometimes it is another, so that while it is a good thing, it is not essential. As I say, we have worked out the matter in Wall street, so it is not as necessary now as it was twenty years ago.

Q. You still think it would be desirable, however?—A. Yes; there could be no objection to it.

Q. Would you put it stronger than that? I ask if you still think it is a desirable thing rather than an unobjectionable thing?—A. Yes; I think it would be desirable. It would crystalize a custom.

Q. You speak of the influence of the banking houses. They of course protect themselves by their own investigations. Do they protect in the same manner people like the small investor?—A. Only in the sense in the way they protect their own reputations. While they disclaim responsibility for the future, which they naturally do, they have a certain reputation interest in the near future, and a great many of them actually live up to it by trying to fulfill the promises that they make to the investors at the time of the incorporation.

Q. Do you think that a greater degree of publicity of the kind you just have suggested, if it were enforced in this country or in this State, would hamper legitimate business at all?—A. I do not. It would not hamper—a reasonable degree of publicity.

Q. Perhaps you would be willing to define more clearly what you mean by reasonable degree of publicity?—A. The difficulty is that when a company is incorporated the shareholder has immediately a right to information in regard to his own company. At the same time he is unfamiliar with the details of that company; he does not know what is for the best interests of that company; that must be left to directors and officers. Now, if all shareholders who buy to-day and sell to-morrow should have knowledge of all inside information, there is no question at all that it would be serious in a great many cases to competitors of those companies, because the simple change of the form of a business from a partnership to a corporation does not alter the fact that that concern is in business exactly the same as before, and the same reasons for not giving up its business secrets which existed in the shape of a partnership apply to the corporation. The circumstances of the business are not changed by the style of doing it. On the other hand, there is that clear right of the shareholders. Now, what compromise can be made between those two? That is the main question. I have myself once or twice advocated that such a concern should be examined, say, by the Audit Company of New York, and that the results of that examination should be stated without details, as perhaps satisfactory to all concerned. Not long ago a company in New York was said to have been guilty of a breach of good business principles in making a certain contract, and the shareholders demanded that the whole matter should be laid bare before them. The company said that to do that would be very serious in their business, as they had very active and strong competitors, and it was compromised finally by an appointment of a small committee of shareholders who were instructed to investigate the matter and give their findings, but no details. Now, that is the same principle exactly. That is a practical case that happened here in New York not long ago.

Q. The finding should include a sufficient statement so that the real actual condition of the business should be understood, should it not?—A. Yes; I do not think there will be any objection to that.

Q. Could you perhaps state offhand the general items you think should be included in such balance sheets? Such a report, I mean, as could be made with safety.—A. Cost of property, including or not including good will, as the custom of the company might be; tangible assets, either in one lump sum or subdivided; the capitalization, subdivided; all the debts of the company, in one sum or subdivided; surplus of the company from the previous years; profits of the company for this year, on one side, and on the other—that is, debit and credit, you understand. I ought to say we have in several cases done that same thing. The Pressed Steel Car Company—I make mention of this because it is a matter no longer secret—is issuing a report with our certificate, based in just that way, and it may interest you to know also, since you are interested (it has nothing to do with this particular testimony, but it is right in the line of the commission, I think), they have just issued mortgage notes to the extent of \$5,000,000, payable in 10 years, and they guarantee that they will always have on hand certain things, and so on, which are intended to be a safeguard to the investor, and they have appointed the Audit Company of New York to ascertain whether these stipulations are being carried out, agreeing that its decision shall be binding. It is a new idea in industrial finance.

Q. You spoke of giving the tangible assets, subdivided. Can you, perhaps, mention the different items that you think could be distinguished? For example, would you, in giving the tangible assets, usually give the amount of stock on hand, the amount of material on hand, for example?—A. I purposely said either in lump sum or subdivided, according to the position of the company. There are times in the history of different industrial companies when to state the amount of raw material on hand would be a very serious drawback. I have in mind one or two companies now that would be seriously embarrassed. On the other hand, there may be fairly steady industrial companies, which have no objection to doing that; therefore I say it ought to be left to the company—to the good sense of the company. You can not even theorize about these things in exact particulars.

Q. To the good sense of the auditors?—A. Auditors, or good sense of the companies.

Q. Will you discuss in the same way, briefly, the subdivision of debts?—A. There is the same thing again. A company at one time may borrow very large amounts of money from the bank, and have very small amounts owing for material unpaid for. That might be a very important point for people to know. They might go around and whisper about their credit. At another portion of the year they might have had a very large amount of debts for goods purchased and unpaid for, and owe a very small amount to the bank. I think they ought to be allowed to state it or not state it, according to the circumstances of their business. It does not really affect the investor.

Q. What would you say with reference to the allowance for depreciation of the plant, and so on, appearing in accounts regularly?—A. I think it ought to so appear. It is, in my judgment, just as much a charge on the business as amounts paid for labor. It is in effect a distribution of a sum of money which inevitably will have to be paid sometime or other—that is, for the renewal of plant, machinery, and so on.

Q. Under the laws of Germany a provision of this kind is made. That out of the profits there shall regularly be reserved 5 per cent of the net profits in the building up of a reserve fund until that reaches 10 per cent of the fixed capital, and thereafter this reserve fund is to be regularly kept. Do you think that any regulation of that kind provided by law would be good? Is there any advantage in it?—A. That is not the American way. The Germans build things theoretically. There are so many diverse interests and so many corporations doing different things in the United States that a rule could not be framed that would be applicable to all of them. The difficulty of the situation is to determine what is the proper and fair amount to be charged off for depreciation.

Q. This question had to do, not with the charging of depreciation, but with the accumulation of a reserve fund.—A. It is the same thing. Now, as to that reserve fund, of course that could be set aside, actually set aside, or could be reinvested in the plant. Sometimes one thing is advisable and sometimes another. It would be rather foolish to set aside that reserve fund at 2 per cent and then borrow money to do something with; but at the same time there are circumstances sometimes—in steamship companies, for example, where a new steamship is staring you in the face—where it is well to put aside the actual money.

Q. A further provision of this kind has been suggested: That if the annual balance sheet shows that half the company's capital will be lost, there shall be immediately called a special meeting of the shareholders in order to submit the condition of the business to them as a whole and see what is to be done; and a still further provision suggested is that if at any time it appears that the liabilities exceed the assets, the managing board itself must at once institute bankruptcy proceedings.—A. I do not think the American people would like that.

Q. No question about that; the American corporation directors would not like it. I was going to ask the question from the point of view of business policy. Some of the opinions seem to be along this line: That while, of course, it is hard for the directors and hard for the company at times, still, in the interest of creditors, and, in the long run, in the interest of the general public, it seems to work well.—A. I do not think that; that is a hard question. This same publicity that you were just speaking of would, perhaps, so far as our diversified interests are concerned, meet the case but not the exact provision as to what should and should not be done; and I certainly think precise regulations of that character would work in Germany pretty well, but not in the United States.

Q. You are of opinion if there was an attempt made to make our laws as rigid as there, it might hamper this country in international production?—A. No question about it. We have our drawbacks, as I said before. We have industrial as well as individual faults; but it would be very unwise for us to hamper to any

unreasonable extent the great captains of industry who have now before them the opportunity to make the United States one of the great nations of the world.

Q. You have just made a suggestion as to the benefit that will come to this country or that has come to this country from having these large industrial combinations sell their products cheaper abroad than here. Do you think that in the interest of the public here they are justified in so doing in many cases?—A. I think it is the same in that as it is in the questions discussed yesterday in regard to the result of the combination of the anthracite region. The first result of that, for example, would be the possibility, of course, the absolute physical possibility, of raising the price of coal; but I think the ultimate result would be the lowering of it. It is no doubt the same way with exports. The first result is to create a great contrast between the export price and the domestic price, but in the long run it would have the result of reducing the price at which goods could be manufactured and sold to the domestic consumer.

Q. From the standpoint of interest to the public as well as the corporation itself and the wage-earners, is it desirable to get a market abroad even at lower prices?—A. I do not think the public at large realizes the importance of it.

Q. This frequent custom you speak of is, so far as your knowledge goes, practically universal in other countries as well as in this country in order to secure foreign markets?—A. Yes.

Q. It is simply a normal business condition?—A. Simply a normal business condition. It is more notably so in the United States over a very, very large extent of the country. When the New England manufacturer, for example, finds that he is getting overstocked and that the domestic market is not taking his product and he wishes to keep his skilled labor, he will go on manufacturing and sell that overplus in Kansas City in competition with a Kansas City firm at prices which may yield the Kansas City firm a profit, but which yield no profit to the New England manufacturer, and he would do that persistently. And that sort of thing is going on all over the United States. That is the reason the railroads are carrying so much business, and the moment the railroads should raise the freight rates they would dry up their traffic. So we go back to the same idea of enlightened selfishness.

Q. I should like to sum up your own general opinion in a word or two as I understand that general opinion in reference to this matter of promotion and publicity as regards the annual business of corporations, to see if I understand you correctly. You do think that in the interest of the investors and in the interest of the public it would be desirable when a company is organized to have in the prospectus or make public in some way the tangible assets distinguished carefully from the good will; you personally think that it would be desirable in the statement of the value of the good will to distinguish also the pay of the promoters?—A. No.

Q. You do not think so?—A. I do not think so.

Q. You think you ought not to divide the item of good will?—A. No; I do not.

Q. Distinguish the promoter and underwriter from the earnings that come from the business.—A. I might state, for example, if properties are bought for 50 and sold at 100 (you and I buy at that figure and the property is really worth \$100) it makes little difference to us whether the promoter has bought for 50 or 75. The main thing with us is, not how they were got together, but what they were bought out for.

Q. The other question is perhaps as to whether the value after all does not depend to a considerable extent upon what people can be made to believe it is worth?—A. Undoubtedly.

Q. Now, the question is if people are not frequently led to believe properties are worth a good deal more than they are worth and whether they would not know better if they knew what the profits of the promoter and underwriter were.—A. That might be true in certain cases, but there are a great many cases where such knowledge would have no relation to the facts. Let us suppose a city has two trolley lines, one at each end. The stock of these companies is worth par. Somebody comes along and buys both of these at \$100. They are worth par. He puts them together and puts in connecting lines between them, and the stock of those companies is then worth \$150. There is a case where the benefit of that stock comes naturally from combination. Now, it is of no consequence to the person who buys it whether he pays \$100 or \$125 if the concern, after running and with all these improvements, is legitimately worth \$150. And one of the most surprising things is the way a good trolley line will create traffic.

Q. Would you yourself consider the comparison a fair one between a trolley line of railroad or any other industry that has the element of natural monopoly in it

because a competitor can not go into the same locality with a corporation that is selling some article on the market of ordinary consumption—sugar, let us say?—A. No; certainly not, in a great many ways. I speak of that simply to show you what might be the case. To illustrate what I mean, there are conditions of industrial combinations where that principle will still hold good. The Pressed Steel Car Company is a combination of one company that had patents on the bodies and another company that had patents on the truck.

Q. In that case the element of good will is largely in patents?—A. Certainly.

Q. And that brings in the legal monopoly element again?—A. Yes. That, of course, we do not discuss; we all agree it should be so; but, of course, that does not prevent anybody else making cars out of another kind of steel. He has no monopoly at all. It is a fair and square business, a legitimate advantage.

Q. How far do you think, in all of these lines of business that we have been speaking of, particularly the industries, the interests of the investor in the stock or of the shareholders and the interests of the consuming public coincide?—A. I think they are more intimately related than appears at first sight. That is where I differ with a great many persons who have written or spoken on that subject. They seem to think there is an irreconcilable conflict between the two, as I said a moment ago. I really think, from my experience, that what keeps the investor posted as to the real value of his property will in the long run keep the company also from imposing on the consumer. In other words, as you said, some degree of publicity is a remedy for this without legislation.

Q. Would you say that the interests of the directors, the large majority stockholders, differ enough from those of the minority stockholders—I mean as a matter of actual experience in the industrial combinations as we find them to day in New York—so that the directors need to be put under more careful restriction of law than at present?—A. No; I should say not. There ought to be no difference between the interests of the majority and of the minority, and the theory of our directors is that they do represent. Of course, that theory is not always carried out, but that is the actual fact. I might also say, bearing on this point, if you will bear some little digression, I think the American principle of having companies run by the directors is a great advantage to us—more so than having the company run by the stockholders, as it is run by the British. I am opposed to the principle, which seems to be creeping into a great many of our organizations, of having the stockholders called together to declare dividends or something of that kind. I do not believe they can know the business as the directors do.

Q. Do you favor our American plan of having the business largely in the hands of officers, the president and two or three officers, instead of the board of directors as a whole, and having the board of directors really stand in the background, as I suppose they very frequently do?—A. That arises from the social stringency, the social condition. In other words, in England there is a large and important class of people who have made their money and who would like to be busy with important affairs. In the United States we are all busy. It is an easy matter to get a good business man in England to go on as a director of companies merely for the sake of having something to do, people who have independent fortunes. There are very few in the United States who have independent fortunes who are not engaged busily in business. The theory works out beautifully in England, and it will in time work out in the United States.

Q. Have you in your mind the difference between the American and the English and the German methods of doing business? Is it true that the American business man is willing to take individual responsibility; that is, that the president of a company is willing to go ahead and make a very important bargain and trust to his directors to approve of that bargain afterwards, whereas the English and the German business man hesitates to take individual responsibility in that way, but insists upon responsibility by the corporation?—A. That is a very important point. It is one reason for our tremendous success. I have heard several presidents of important corporations say they were obliged to violate the by-laws of their corporations by agreeing to an important contract before their board of directors had authorized it, but knowing their policy and their feelings, they were acting as they thought merely as their mouthpieces until such time as they could affirm the transaction.

Q. You think the American does take that responsibility, and the German and Englishman do not?—A. Quite true.

Q. And that is one reason for industrial supremacy in the United States?—A. Yes.

(Testimony closed.)

NEW YORK, February 18, 1901.

TESTIMONY OF MR. JAMES E. CHILDS,

(General Manager New York, Ontario and Western Railroad.)

The special subcommission met in the rooms of the Chamber of Commerce, New York City, February 18, 1901, Mr. C. J. Harris presiding. At 10.47 a. m. Mr. James E. Childs, general manager New York, Ontario and Western Railway Company, appeared as a witness, and, after being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Will you give us your full name, your address, and your occupation?—A. James E. Childs is my name, and my address No. 56 Beaver street, New York City; I am general manager of the New York, Ontario and Western Railway.

Q. Is your line engaged in the mining and transportation of anthracite coal?—A. It is.

Q. About what proportion of the anthracite coal business does your road do?—A. In 1900 it did 3.75 per cent of it.

Q. What part of the coal fields do you specially touch?—A. Scranton to Forest City—the Wyoming field.

Q. (By Mr. RIPLEY.) Does your line extend to Wilkesbarre?—A. It does not; it terminates at Scranton.

Q. We would like to ask you in regard to the way in which rates on anthracite coal are made up—how they are based.—A. The railroad tariffs in effect are: Buffalo, 82; Chicago, \$1.50. St. Louis, \$1; Tidewater, \$1.75. But nearly all of the coal carried by the Ontario and Western road is carried on a percentage basis.

Q. Have there been any changes in recent years in tariff rates on anthracite coal?—A. There has been but very little change, but there are occasional changes from year to year.

Q. You have mentioned certain definite rates, and then a percentage basis. What do you mean by percentage basis? Will you explain that phrase more fully?—A. When the Ontario and Western reached the coal fields in 1890 we made contracts with individual operators, agreeing to carry their coal to tide water on the basis of 40 per cent of the tide-water price. At that time the contracts allowed a part of the terminal charge to be paid by the individual operator. So that for coal transported to tide water we received 40 per cent plus 5 cents, which latter amount covered the expense of the trestle charges in New York. That arrangement continued in effect for some years, and then the individual operators sold their coal on cars at their mines at 60 per cent of the tide-water average price, eliminating that 5 cents terminal charge and other costs, like commissions, etc., of the transporting line. That arrangement has been in effect since and is in effect now.

Q. (By Mr. RIPLEY.) Could you give figures simply as an illustration? Suppose the tide-water price is \$4—A. (Interrupting.) I wish I could suppose anything as fine as that stretch of imagination.

Q. Will you give just one figure to show what you mean exactly?—A. The tide-water price is, say, \$3, and the price to the operator at the mine \$1.80 net, without discounts, rebate, or anything of that kind. They get their accounts settled on the 20th and 25th of the month.

Q. Is there not a 65 per cent basis under discussion among the railroads?—A. There is.

Q. That, however, is only provisional at the present time?—A. I believe it is. I have understood that the operators have agreed to it, but no settlements as yet have been made on the 65 per cent basis.

Q. Does that understanding apply to all railroads entering the field?—A. I think so.

Q. (By Mr. KENNEDY.) Mr. Childs, have you figured out how much the charge is per ton per mile for transporting anthracite to the seaboard, tide water?—A. It is all shown in the annual reports of the officers of the railroad company. I have a copy here that I can refer to. [Witness gets report and reads.] "Twenty-first Annual Report of the President and Officers of the New York, Ontario and Western Railway Company, with statement of accounts for the fiscal year ending June 30, 1900." No, it does not give the information in just that form.

Q. Is it about 24 mills per mile?—A. Oh, it is better than that. The average gross revenue per gross ton received by the Ontario and Western for the year ending June 30, 1890, was \$1.128 on all coal transported.

Q. Well, was it about 10 mills per mile?—A. Oh, no; we never got anything like that. The distance to tide water is 214 miles.

Q. (By Mr. RIPLEY.) That is not the shortest route?—A. That is to Weehawken. Then in the summer months we load coal in vessels at Cornwall, which is 54 miles shorter. The figures given are on the Ontario and Western distance to tide water.

Q. (By Mr. KENNEDY.) We have testimony to the effect that the charge averages. I think, 10 mills per ton per mile for the anthracite coal.—A. Oh, we never got anything like that. Our charge runs from 6 to 7 mills.

Q. (By Mr. RIPLEY.) Might not that be true of roads which make the shortest haul to tide water?—A. I think the shortest route to tide water is the Delaware, Lackawanna and Western; that is 145 miles. I don't know much about the details of the Delaware, Lackawanna and Western rate, but I don't think any road ever received any such rate as you mention.

Q. (By Mr. KENNEDY.) Well, I would like to have you explain, while on this head, if there is any difference between the rates for hauling bituminous coal and those for hauling hard coal. A great difference seems to exist; please explain it.—A. I do not know much about bituminous coal, and but very little about bituminous-coal rates.

Q. (By Mr. C. J. HARRIS.) In answering these questions we would not only like to have you answer in regard to your own road, but we want to get at the subject generally, what you know of the general practice.—A. I presume you want the facts. I do not know very much about any road except the Ontario and Western; the rest of it is all surmise. I prefer to have you get that information from some source more reliable.

Q. We want to get at the general customs and practice and methods of doing business in this line of your railroad and others; I wished to say that, so that you could speak generally if you wish to do so. Do you purchase the coal that you transport to western points as you do that you take to tide water?—A. The individual operators, the companies on the line, make contracts with the sales agents for a percentage of the price per ton in cars at the mine. They ship the coal all over the Ontario and Western under a contract. I will make that a little more clear: When we began in the anthracite region, the Ontario and Western was purely a transportation company, owning no coal mines and operating no coal mines. We then made contracts with certain individual operators. I know of early instances where we made loans for improvement and development of the properties, taking a contract for the transportation of the coal, so long as the coal should hold out in the mines, upon the then prevailing basis of 60 per cent, which I have already explained. Now, you ask what changes have been made in recent years—in the last 2 years. The Elkhill Coal and Iron Company absorbed six or seven of the smaller mines owned by individual operators.

Q. (By Mr. RIPLEY.) In what territory?—A. In this upper Wyoming territory. There is Richmond No. 3; Richmond No. 4; West Ridge; Ontario; Rush Brook; the Raymond, sometimes called the Forest Mining Company; Mount Pleasant, and the Johnson Coal Company.

Q. Those, in the main, ship over your line?—A. Those forming the properties of the Elkhill Coal and Mining Company. The Ontario and Western loaned money to the Elkhill company to enable it to purchase these collieries and to promote the development and improvement of them, making with the company a contract which secures to the Ontario and Western the transportation of all the mining company's coal, so long as the coal shall hold out in the mines, upon the current rates. The Scranton Coal Company was also formed a year ago last February in the same way and purchased the coal properties of the Lackawanna Iron and Steel Company's two large mines, the Pine Brook and the Capouse. The Ontario and Western Company made a similar contract with that company. That is in addition to the few individual contracts we have yet with individual operators, most of which were made in 1889 and 1890, and a few smaller ones since that time, all upon the same basis.

Q. What proportion of your tonnage, roughly speaking, would this absorption of these companies represent?—A. Over 80 per cent now. Less than 20 per cent of it comes from individual operators.

Q. (By Mr. C. J. HARRIS.) Does your company own and operate any mining companies as coal companies?—A. The company owns no mines and operates no coal properties except as stated.

Q. (By Mr. KENNEDY.) Are the same parties who are owners of the Elkhill Coal Company owners partly of the Ontario and Western Railroad?—A. No; the Ontario and Western Railway Company owns the majority of the stock of those companies.

Q. (By Mr. CONGER.) Does the Elkhill Coal Company and this other one you have mentioned ship any of its product over any other road than your own?—A. No; not unless it has what we call exchange coal. For instance, if we were long

of a grate and the Delaware and Hudson Company were short of that size, and we were short of egg and they long of that size, we would exchange car for car.

Q. Then to all practical purposes your railroad company operates a coal company, does it not?—A. Well, I am not a lawyer. I do not know that I want to go into the legal points of the case.

Q. I do not mean the legal standpoint. The railroad company owns the majority of the stock.—A. The Elkhill Coal and Iron Company has a charter running back 30 years or more, but it was secured for this purpose, and, as I said, the Ontario and Western Company loaned to that company money to enable it to purchase and develop these coal properties.

Q. And your probable purpose in doing that was to get coal for shipment, was it not?—A. To secure transportation was the primary object.

Q. Now, was there any economic or business reason or business condition that existed at that time as regards other railroads and other coal companies that practically forced your railroad company into this business?—A. Why, the reasons are purely economic. We built a branch line from our main line to Scranton, 54 miles, which was a very expensive line to build and to equip, costing in the neighborhood of two and a half to three million dollars. It runs from Cadosia to Scranton, and has many branch lines to the mines. We have invested millions of dollars in equipment in addition to the cost of construction of the line and branches, and it was essential, inasmuch as our bonds run for a long term of years, to secure, if possible, the transportation of coal to make that line profitable during those years. Contracts with individual operators running only for a few years could not be relied upon for traffic for any great length of time. We had some contracts that were to run during the life of the colliery covered by them, but many of the collieries are short lived. Some of them have already reached their largest output and are on the downward grade. The object was to secure the transportation of as much coal as we could at current rates, and that is embodied in the contract.

Q. Nearly all of the coal lines, so called, have been compelled to take practically the same steps for securing this transportation of coal, have they not?—A. I think as a rule they did that many years ago.

Q. And your road is simply following in the footsteps of the roads that have gone before in the same line of business?—A. Practically.

Q. (By Mr. RIPLEY.) Would it be possible for us to secure a copy of one of those contracts with all names stricken out, simply to indicate the general nature of them? Would you be willing to let us have one? Would you care to have one printed?—A. My impression is they are filed with the Interstate Commerce Commission at Washington. There is no objection to giving you copies, if you want them. (See copy, p. 505.)

Q. (By Mr. C. J. HARRIS.) About 20 per cent of the coal operators on your line are independent—that is, the independent operators produce 20 per cent of the product?—A. Yes, sir; nearly 20 per cent.

Q. And the railroad company buys their coal, allowing them so much?—A. Exactly the same terms as are given the coals of the companies.

Q. Sixty per cent?—A. Sixty per cent up to the present time.

Q. Do you have an agreement here with other railroads and other coal companies as to prices to be charged for coal?—A. I never knew of any agreement with any other company in relation to prices.

Q. The independent operator, if the price is raised here in New York, gets more for his coal at the mine?—A. Sixty per cent of the price, whatever it may be.

Q. If the price is less, he gets less?—A. That is right.

Q. (By Mr. KENNEDY.) Do the independent operators ever ship to tide water?—A. Oh, yes; a number of them have their own sales agents here in New York.

Q. Do they get cars as freely for their product as cars are given?—A. (Interrupting.) I do not know how that is on other lines. None of that on the Ontario and Western.

Q. They do, you say?—A. None of them on the Ontario and Western. As I said, they sell their coal that goes over the Ontario and Western on the 60 per cent basis at the mines. On other lines some of them have their own cars, and some of them have trackage arrangements, as, for instance, the Delaware, Susquehanna and Schuylkill, and have their own selling agencies here in New York.

Q. There is no independent shipping over your road?—A. No. Mr. Kemmerer is one of those men who sells his own coal. He elects to sell his own coal. He ships over the Ontario and Western.

Q. (By Mr. RIPLEY.) No company, then, actually owns the coal it transports?—A. The sales agents representing the Ontario and Western buy the coal at the mine and pay for it.

Q. You assume, therefore, all risk of accident and carriage?—A. Demurrage, commission sales, and all that sort of thing.

Q. Is that the usual practice on most of the roads?—A. Well, it is on a number of the roads.

Q. (By Mr. C. J. HARRIS.) What advance is there in the price of coal at the present time over last year at the same time, if any, at tide-water points?—A. The Ontario and Western's average at tide water in 1900 for prepared sizes—that is, everything above pea, was \$3.756. Our average from 1894 to 1900 was \$3.48. In December, 1900, it was \$3.75.

Q. What is it now?—A. I have not got the price for the last month. It has not been figured out yet.

Q. Is it an advance of 50 cents a ton or something like that?—A. No; about 25 or 30 cents.

Q. That is to say, February prices to-day compared with a year ago would be about 25 cents a ton higher?—A. Yes; 25 to 30 cents higher. Our tide-water average for 1899 was \$3.393.

Q. What is the cause of that advance?—A. It is supply and demand.

Q. Has the question of higher wages anything to do with it?—A. No; I think the scarcity of the coal and the demand for it makes it advance a little in price.

Q. (By Mr. KENNEDY.) When you say scarcity of coal are you referring to any particular field or to the entire anthracite field?—A. In the last year we had nearly two months, you know, of practical idleness during the strike, and a shortage of coal in consequence.

Q. (By Mr. C. J. HARRIS.) Were your mines affected by the anthracite coal strike last fall?—A. They were shut up. We didn't mine a pound of coal during the strike.

Q. Were there any advances in wages made?—A. Yes.

Q. How much was the advance?—A. It was supposed to be 10 per cent. The advance in wages together with the reduction in the price of powder made a 10 per cent advance.

Q. That, as well as supply and demand, would have some effect on the price of coal?—A. I do not know that it would.

Q. Why not?—A. You must sell coal at the price you can get for it. I don't think the question of what it costs has very much to do with it, but it ought to have.

Q. (By Mr. KENNEDY.) Is it true that the price of coal is fixed arbitrarily by the representatives of the coal companies? That has been frequently charged, and it has been said that supply and demand has nothing to do with it.—A. There has never been any agreement made for the price of coal.

Q. There has been an understanding, has there not?—A. No.

Q. Informally?—A. Not even that; no two companies sell coal at exactly the same price.

Q. The witnesses in 1892 before a committee of the House of Representatives were quite unanimous in their statements that there was an informal agreement.—A. Years ago sales agents used to hold meetings monthly, and I have attended some of them. The time was chiefly taken up by accusations. This and that one was accused of cutting rates, and as a consequence there was scrapping among themselves. But they haven't even held a meeting for about two years. The meetings never amounted to anything; they never succeeded in fixing a uniform price.

Q. There is a substantial similarity in the price, however, charged by all the different companies?—A. Yes. One company publishes a price and the other companies likely enough publish similar prices. When they come to sell coal, they don't often realize the price of those schedules.

Q. Is not the production of coal kept down in some of the fields?—A. Yes, necessarily at certain times when the market would not take the coal. With us loaded cars have accumulated to such an extent that we were unable to supply empty cars for the full working of the mines, and that meant a pretty serious restriction. Out of a total equipment of 4,900 cars I have had over 3,000 loaded with coal that there seemed to be very little demand for, and of course that condition restricted the supply of cars at the mine. In some cases that condition is relieved by storage.

Q. (By Mr. RIPLEY.) Does it pay to unload coal and store it and then reload it?—A. That is a mooted question. I have never in the past stored coal; never had a storage plant. The cost from waste and the cost of handling two or three times would amount in the neighborhood of 40 or 50 cents a ton. The quality of the coal is also affected by storage. We never can get as good a price for it after it has been stored.

Q. (By Mr. C. J. HARRIS.) Do some companies carry a large stock in store?—A. Nearly all of them do. In the last year I have been compelled to erect a plant, because at certain times when the cars get loaded up we are practically out of

business with one-half of our equipment, and if I can store that coal the market will take it in a few months, so I am just now completing a storage plant that will hold about 120,000 to 130,000 tons.

Q. (By Mr. RIPLEY.) Are you obliged to store because the demand is variable between different seasons of the year?—A. Yes; the output is in excess of the market usually for 2 or 3 months of the year. The excess often comes in February, March, April, and May, and my idea is that if I can store the surplus output during that period the market will take it in other months, when the demand is frequently in excess of the output, as it is in September, October, November, or it may be a month earlier, but it runs along about that time.

Q. If you could produce the year round up to your maximum capacity, how much percentage difference would the increased production make in your total output, approximately?—A. Well, I don't know; I can't make a guess at that.

Q. It would be very much larger?—A. Undoubtedly it would be larger.

Q. (By Mr. C. J. HARRIS.) Suppose your roads and companies should increase their output, say, 2 or 3 per cent from 3.70 per cent of the entire anthracite trade, you would run up so you would produce 5 or 6 per cent. Would there in that event be a protest from other anthracite coal companies?—A. I do not think so; we have been moving up within the last year or two.

Q. Are you not limited to a certain output?—A. There is no limit.

Q. As in relation to the whole anthracite coal trade?—A. We are not limited.

Q. Are other roads?—A. There is no agreement as to the percentage that these companies should take out.

Q. (By Mr. RIPLEY.) Was there formerly?—A. There never was; we never agreed on anything.

Q. What does "the table of allotment" mean as the phrase was used in former testimony?—A. Well, there was in 1896 an attempt made to allot tonnages and percentages, but we could not get inside of 100 per cent. It was never consented to and was never intended to be operative unless by unanimous consent.

Q. Your percentage of total production has increased very considerably in the last ten years?—A. Yes.

Q. Some roads have correspondingly decreased in their percentage, have they not?—A. They must have.

Q. Will you specify any of them?—A. I can tell you this: About 1896 we were getting about 3 per cent; we are carrying now, as you see, considerably more, and in coming years we will even exceed our present percentage.

Q. (By Mr. C. J. HARRIS.) What proportion of your coal goes West and what proportion goes East?—A. About one-half of our coal goes to tide-water points. We send some coal to Oswego, where we ship over the lakes to Canada and Western points, but we send very little coal to extreme Western points—Chicago, Milwaukee, and Duluth; that is, of late years.

Q. (By Mr. RIPLEY.) Do you purchase on the percentage basis for shipments West or anywhere else than to tide water?—A. To all points we ship to.

Q. Is it true that rates to New England are made up by a combination of two rates, one to some point on the Hudson River, or near it, and another the remainder of the distance?—A. Almost all coal we ship to New England is shipped by water.

Q. What roads ship over the Poughkeepsie Bridge?—A. We have shipped a little that way, and other roads do ship that way; but a very small amount goes by rail. The principal consuming points for anthracite coal in New England are near the coast. The manufacturing towns are near the coast, and the bulk of it goes by water from tide water points.

Q. Are any of the railroads interested in lines of barges so that they carry their coal to New England in their own carriers?—A. I think nearly all of them own barges.

Q. You therefore carry it and deliver it to New England in your own barges?—A. Certainly; we have barges, but we do not rely exclusively on them. We hire other vessels. We have barges of our own which we use for this shipment to Sound points and New England points.

Q. Does any particular proportion of the total output of coal go over any of the roads by rail?—A. Well, there is a small amount going over the bridge. There is some coal transferred by floats from New Jersey to points on the New Haven road, and which goes through in cars.

Q. The ownership by one company of a through line from the coal field to New England will affect that, will it not?—A. I do not think so. There are so many routes to reach New England points. All companies can reach all New England points. No one road could ever absorb the trade. You are speaking about the

making of rates via the bridge. It has been quite the rule recently for a rate from the mines to Highland to be on the same basis as the rate to Cornwall or Newburg, two old points they have been shipping coal to for many years on the west side of the Hudson, putting the coal to Highland at practically the same rates as at Newburg.

Q. You have nothing to do with rates on coal east of the Hudson River?—A. The rates are made by those roads. If an individual shipper went there and undertook to ship that way I suppose he would pay for carrying through to Highland just the same as to Newburg, and make his own arrangements beyond there; but, as I have said, the coal we ship there is coal purchased in the car at the mine, and nearly all of our New England coal goes by tide water.

Q. (By Mr. C. J. HARRIS.) I suppose the railroads can not compete with water transportation really, can they, taking Fall River and Boston?—A. Not for these near-by coast points, they never have been able to do so.

Q. Would there be any advantage in the railroads carrying it if they transported it on barges?—A. They have carried coal from Boston to other points within 35 and 50 miles. They send coal through to Boston by water and on from Boston to destination by rail.

Q. How much foreign trade is there in anthracite coal?—A. I never heard of any.

Q. None at all?—A. None, except in Canada.

Q. What do you say of competition in the anthracite coal trade from soft coal—bituminous coal: does that cut any figure at all?—A. Yes; it does with steam sizes to a certain extent. By steam sizes I mean the sizes we use to generate steam. The domestic sizes are egg, stove, and nut. The steam sizes are lump, broken, and the finer sizes below pea.

Q. If on account of the smoke nuisance they could not use bituminous coal in New York, they would be obliged to use anthracite?—A. They do use it; they have the smoke appliances.

Q. Would you say that there is really any competition to speak of that anthracite coal would have from the bituminous coal?—A. Yes; undoubtedly for steam purposes.

Q. What proportion would be steam coal?—A. Over 10 per cent.

Q. (By Mr. RIPLEY.) Is that proportion greater than it was formerly?—A. Yes; I think it has increased, because we are reclaiming more of the fine coal that formerly was thrown in the culm piles.

Q. Are any of these culm piles being worked over at the present time by any companies of which you have knowledge?—A. Yes.

Q. The old refuse heaps of many years ago?—A. Yes.

Q. (By Mr. KENNEDY.) Has not it happened in the past that when the price of anthracite coal was put up the advance was an inducement to the bringing in of bituminous coal, which displaced the anthracite to a certain extent?—A. Yes; undoubtedly, so far as steam sizes were concerned.

Q. Is there not a movement on foot now, in the interest of the anthracite coal production, to acquire interests in the bituminous fields to the end that the production of bituminous coal may be kept down in the interest of anthracite coal?—A. I do not know; that is beyond my ken.

Q. (By Mr. RIPLEY.) Has there been a relative increase in the demand for prepared sizes in the eastern part of the country as compared with the demand for steam coal?—A. I do not think the demand for domestic sizes has increased quite as much, as I said just now, as the demand for steam sizes. In fact, we are producing more of the steam sizes, and putting on the market fine coal that was formerly considered unsalable.

Q. Would not a decrease in the price of hard coal of prepared sizes for domestic use increase the demand for it?—A. Possibly.

Q. Have you ever followed the relation between the prices of coal and the amount which is used for domestic purposes, or the consumption of prepared sizes, which I suppose is mainly for domestic purposes?—A. Prepared sizes are chiefly for domestic purposes.

Q. (By Mr. C. J. HARRIS.) What is the maximum or limit to which you can put prices of anthracite coal and still do the business that you are doing now?—A. I do not know.

Q. You say there has been an increase of price of, say, 30 cents a ton during the last year, does that raise indicate any falling off in the volume of your business?—A. No; on the contrary, it has increased business.

Q. Business has increased with the increase in prices?—A. Yes; there has been a great demand.

Q. How far could that limit go?—A. I do not know.

Q. Suppose you raised it another half dollar, what would be the volume then?—A. I would not think it advisable to make that increase. I do not know what the effect would be.

Q. If the people had to have it they would have to pay the different companies what they charged, would they not?—A. I do not believe the price could be forced in that way; there are too many competing for the trade.

Q. (By Mr. KENNEDY.) Is there really much competition for the trade now?—A. Oh, yes, it is very lively.

Q. Well, has not "the community of interest" plan gone to such an extent that there is really very little competition?—A. I have not seen any effect of it on the trade.

Q. Do you dread such an outcome?—A. No.

Q. Do you anticipate it?—A. I do not know what to anticipate. There are a good many strange things done on Wall street.

Q. (By Mr. RIPLEY.) Is your road affected by this community of ownership, so far as you are willing to state?—A. It is not.

Q. (By Mr. C. J. HARRIS.) The demand for anthracite coal in Western cities, such as Chicago and St. Louis, is relatively very much smaller than in Eastern cities, is it not?—A. Yes; in proportion to the population.

Q. They would not use more than a tenth, would they?—A. Probably not. A larger amount of soft coal is used in the West for domestic purposes than in the East.

Q. Anthracite coal is considered rather a luxury there?—A. Yes. In the Northwest they burn corn.

Mr. KENNEDY. Wheat, sometimes.

Q. (By Mr. RIPLEY.) Will you say anything respecting the possible competition of coke for steam purposes in New England, for instance, with the anthracite, or steam sizes of the anthracite?—A. I do not know anything about that.

Q. It has not affected your business as yet?—A. I have not seen anything of it. Referring again to the matter of prices, the Ontario and Western's tide-water average 1894 to 1900 was \$3.48. That covers the period of seven years. In December, 1900, it was \$3.75.

Q. (By Mr. C. J. HARRIS.) You said there had been a 25 or 30 cent advance. That is about the same?—A. Yes; that is about 27. I did not have the exact figures.

Q. Has your railroad been in the hands of a receiver in recent years?—A. Not in twenty years or more.

Q. (By Mr. RIPLEY.) Since what time?—A. It was reorganized in 1880, I think. That was before my connection with the road. I came on later.

Q. Can you state from hearsay what were the conditions which led up to that receivership without specifying names at all?—A. Why, it would take a good while to explain that. I think in the first place the roads were built chiefly on town bonds, and when it was built it was called a road "without debts or traffic." After reorganization it was sold out for four million and some odd thousand dollars, and it had on it over fifty millions of bonds.

Q. It was sold for four millions?—A. Between four and five millions.

Q. What is the present capitalization, including stock and bonds?—A. About fifty-eight millions.

Q. Of course great improvements have been made in the line of property purchased, etc., representing part of that difference?—A. Oh, yes. That large volume of stock is accounted for by the fact that the purchasers of the road, in the reorganization, offered to allow the holders of bonds to take common stock if they would pay an assessment of 20 per cent, and nearly all of them came in, thus increasing the capitalization about fifty millions.

Q. More than was expected at the time?—A. Yes.

Q. By reason of the operation of the plan?—A. I do not think the reorganizers of the road expected them to come in, but they did.

Q. Fifty millions was the figure at the time it was reorganized?—A. Yes. The practical investment of the road at that time was an investment of two millions in preferred stock.

Q. Does it so remain at the present time virtually under the control of the preferred stock?—A. Yes; except that most of the preferred stock has been taken up in exchange for bonds.

Q. (By Mr. KENNEDY.) How many stockholders are there?—A. Oh, there are a great many. I would not undertake to say; about one-third of the stock is held by foreigners.

Q. Is the controlling interest of stock held in a few hands?—A. No.

Q. (By Mr. RIPLEY.) You say that the preferred stock practically controlled the road for a long time; does it do so at the present time?—A. The preferred stock is represented by a trusteeship, a voting trust, and will be until it is all taken up. Nearly all is in now.

Q. What proportion of the total stock and bonds, roughly speaking, would that preferred stock represent?—A. I can not say. I will give you a copy of the annual report. I would not like to answer all those questions from memory, but you will find it all in the financial statement of the report.

Q. (By Mr. C. J. HARRIS.) Have you had any strikes on your system recently?—A. Nothing except the coal strike referred to a while ago.

Q. Any on the road itself?—A. We have not had a strike on the road for 15 years.

Q. Do you know anything about the conditions of labor in your coal districts?—A. Having nothing to do with the practical operations of the mines I know very little on that subject except in a general way.

Q. (By Mr. RIPLEY.) What is the price of labor at the present time?—A. I do not want to go into that, because I am not familiar with the operation of the mines.

Q. Your road, as you said before, does not operate any mines directly?—A. No. That you do not is, however, rather exceptional among the coal roads, is it not?—A. No; I think it is practically the same thing on other roads.

Q. (By Mr. C. J. HARRIS.) I suppose your railroad company could not operate a coal mine as a railroad company; your charter would prevent it, would it not?—A. I think so.

Q. (By Mr. RIPLEY.) Will you make any statement respecting the alleged attempt in 1893 to combine many of the anthracite coal roads, especially respecting the reasons for which that combination failed? I refer to the attempt made under the leadership of Mr. McLeod.—A. I think Mr. McLeod's scheme failed because he bit off more than he could chew.

Q. What did he specifically try to do; can you state?—A. He tried to effect the consolidation of several railroads under one management.

Q. By direct lease or purchase?—A. By lease of the Jersey Central, the Lehigh Valley, and the Philadelphia and Reading. Then he branched out into New England and took the New England road and the Boston and Maine, and there he met his Waterloo.

Q. Will you make any statement respecting the causes that led up to the purchase of the Pennsylvania Coal Company by the Erie Railroad? Was it particularly with reference to the proposition to build an independent line to Kingston from the anthracite coal fields?—A. I think you had better get that information from the Erie Railroad Company. I presume that road will be represented here.

Q. (By Mr. C. J. HARRIS.) What chance would an individual operator on your line have to-day in the production of anthracite coal? Do these companies own nearly all the coal lands contributory to your road—these companies which you have mentioned?—A. The Elk Hill and the Scranton Company; yes. Nearly all the coal is shipped over our road.

Q. Those companies have taken up about all the coal lands that are there. There is very little lying about that an independent operator could get if he wanted it?—A. There are occasional sales. The ground is pretty much covered in the older regions, particularly in the Wyoming district.

Q. As a general proposition, would you say that the coal roads control about all the coal mining property tributary to them?—A. No; there is a large field down in the lower region. It is pretty well taken up in the Wyoming territory. There are large tracts of anthracite coal that have recently been offered for sale down in the lower region, in the neighborhood of Pottsville.

Q. Owners would have to have branch lines built to them?—A. Yes, from nearby railroad lines; that is, in the Reading territory.

Q. What would be the facilities for a man to open up. Suppose he was 15 miles away from your line, would it be possible for him to build a branch to connect with you?—A. If he had a large tract of territory, a good coal, we would probably build a line to him for the sake of getting the transportation, and give him the usual form of agreement, which is just the same in all instances.

Q. (By Mr. KENNEDY.) Is your company working all its coal lands, or has it a large reserve of lands to be worked in the future?—A. I suppose these two companies that I speak of have in the ground in the neighborhood of 50,000,000 tons of coal. Over half of it is owned in fee; it will take a good many years to mine that coal.

Q. (By Mr. C. J. HARRIS.) What was your tonnage last year?—A. It was in the neighborhood of 2,000,000. Last year it fell off on account of the strike. Year

before last it was 1,891,000 tons. In the month of January the output was 227,000, so that we shall probably put out in the neighborhood of two and a half or three million tons a year now.

Q. (By Mr. KENNEDY.) Where railroads have such large tracts of coal lands that they are not working, they are paying royalties upon part of it, you say?—A. All of ours is working, practically.

Q. I thought, according to the testimony, that practically these others were yours, the lands of these companies you speak about.—A. I say all of the mines owned by these two companies, the Elk Hill Mining Company and the Scranton Company, are practically in operation to-day.

Q. How much have you in sight?—A. In these two companies, about 50,000,000 tons.

Q. And your yearly production is about 2,000,000 tons?—A. Something over that.

Q. There must be a great many mines that are not actually worked?—A. My dear sir, they could not work the whole field in the year. Of course it costs a great deal of money to start operations, to put up your breaker, put down your shafts, and lay your tracks. You could not undertake to do it unless you had 500 or 1,000 acres to start with. Then it takes twenty-five years to exhaust the coal.

Q. It has been charged that some of the railroad companies own great tracts of coal land that they have acquired in fee and obtain royalties thereon, and that they can not work for 50 years.—A. That is not true so far as the upper region is concerned. It can be said of the Reading, probably, because during Mr. Gowan's time he did buy large tracts. The upper region is generally divided up into small tracts under different ownership.

Q. (By Mr. C. J. HARRIS.) If you take a company that owns large bodies of coal land that won't be worked up for 50 or 100 years and with a capitalization of \$30,000,000 or \$35,000,000, if it sells its present output of coal so as to pay dividends on that immense mass of property that is going to come into use 50 or 100 years from now, is not that an unnatural price of coal?—A. I do not think you have the right view of that condition. The company has a large amount of money there and usually it puts out bonds for a long period, and it would be the part of prudence to have coal enough to last as long as the life of the bonds, because you must pay your interest and the principal.

Q. (By Mr. KENNEDY.) I would like to ask you the number of days in the year the miners in your mines work?—A. I have not the data as to the number of days with me. It is a matter of public record. It is published and printed by the newspapers, and you can get it almost anywhere.

Q. Have you any knowledge upon the point as to whether the miners of the independent producers work as many days in the year as those in the mines of the railroad companies?—A. It is not true so far as the independent miners on the Ontario and Western are concerned that they work fewer days than others. If there is anything of that in the other field, you will find it, because the number of days worked in each mine is shown by itself. The statement is made by the inspector, who is an officer of the State, and it is printed. That shows you the days worked by individual operators' mines, as well as the mines which are indirectly controlled by the railroads.

Q. Has there been any attempt made to secure the control of your road for the community of interests or a consolidation?—A. If any attempt had been made I probably should not know of it. I do not know of any.

Q. What is your opinion about that; do you think the public and the stockholders of the Ontario and Western would be benefited by a community of interests?—A. I can not answer that question.

Q. Have you no opinion about it?—A. No; I do not know anything about the probable result of such a thing.

Q. Do you know the sentiment of the officials of the Ontario and Western in regard to that question? Are Mr. Morgan, Mr. Rockefeller, or the Vanderbilts stockholders in your road, or do you know?—A. I do not know.

Q. (By Mr. CONGER.) They are not represented on your directory, are they?—A. Mr. Depew is on the board.

Q. (By Mr. KENNEDY.) That would indicate a Vanderbilt interest?—A. I do not know that it does necessarily. He took the place on the board of his brother-in-law, who was a director for many years and died. I do not think he has any large block of stock. We do a great deal of business in connection with the New York Central. We interchange a large amount of traffic and rely upon that road for our western connection. Our working with them has been very close and very satisfactory. We use the same terminals at Weehawken, and have trackage rights over the West Shore from Cornwall to Weehawken. With two companies working so closely together it is only natural they should have representation in the board of directors. I do not think the connection means anything more than that.

Q. You do not know that the attempt has been made to bring that road into the community of interest scheme?—A. I do not.

Q. (By Mr. CONGER.) You ship part of your coal west? I think you testified that you did.—A. We ship some of the coal west via Oswego. We have a trestle on the lake and load the vessels there. It goes through the canal to Chicago, Milwaukee, Duluth, and other western points, as well as to Canada.

Q. Many of the other coal roads, I suppose, have termina's at Buffalo?—A. Yes; we have shipped via Buffalo, too. That goes over our line to Oneida and then over the New York Central to Buffalo, and is loaded into vessels at the dock in Buffalo.

Q. How does the price at Oswego compare with the price at tide water?—A. It varies a little, but on the whole it is about the same.

Q. Do you know about how the price of coal at Oswego compares with the price at Buffalo? Is it the same?—A. No, not the same; it is a little less.

Q. At Oswego?—A. Yes; a little less, the difference being about what the rate is going through the Welland Canal to the West.

Q. If a dealer in coal from the Western States should go into Buffalo or Oswego with the idea of purchasing coal, and should go to the various roads or selling agents who had it for sale, would he probably be quoted the same price, or would he get different prices from different dealers?—A. I think he would find it would pay to "shop."

Q. Is it a fact or is it not a fact that the price among the different dealers there is usually about the same?—A. Yes, practically.

Q. Yet you think there is no agreement between the roads?—A. One company might be long of a certain size and might shade the price a little to get rid of it. There is always a little variation in prices.

Q. How much of a variation, approximately?—A. Five to 25 cents a gross ton.

Q. You testified earlier this morning that so far as any actual agreement is concerned your road is not a party to it.—A. (Interrupting.) Agreement in relation to what?

Q. Agreement as to the selling price of coal at any of these terminals.—A. I testified that there was no agreement as to price.

Q. I wanted to ask whether you thought it probable or even possible that such an agreement does exist between some of the other roads, those who handle a large output—larger proportion of the total output—like the Reading and the Lehigh Valley?—A. No, I do not think it is. It would not be effective unless all were in it.

Q. Might it not be possible that those roads controlling 85 or 90 per cent of the total output could make a practical combination on price?—A. No; they could not do it without taking all the interests in. Two million tons could set the price for the whole fifty million.

Q. (By Mr. C. J. HARRIS.) Would not 85 per cent of the coal trade set the price for the whole production?—A. No; the lesser quantity could make the price.

Q. (By Mr. CONGER.) Take tide-water prices, for instance. Suppose the roads controlling 85 per cent of the total product should make an agreement to put the price at \$3.50, where it had been \$3 before; would not your road, putting out 3½ or 4 per cent of the total product, be willing to take the extra half dollar?—A. Certainly, we should be glad to get what we could. On the other hand, suppose there is a very dull period and a road that was not in the combination would shade that price and take the trade, could not that road compel the others to meet its price? I think it could.

Q. (By Mr. C. J. HARRIS.) Have you anything to volunteer?—A. Nothing more.

(Testimony closed.)

EXHIBIT IN CONNECTION WITH MR. CHILDS'S TESTIMONY.

Agreement between New York, Ontario and Western Railway and producers of coal.

[NOTE.—This agreement is identical with one submitted by Mr. E. B. Thomas as being in consideration by the Erie Railroad. Mr. Thomas denies knowledge as to whether the agreements on all the anthracite roads are identical, but Mr. Childs thinks all are alike.]

This Agreement, made and executed in the city of Philadelphia, Penna., this ____ day of ____, nineteen hundred ____, between ____ (hereinafter called the Seller), party of the first part, and ____ (hereinafter called the Buyer), party of the second part, Witnesseth:

FIRST. The Seller hereby sells, and agrees to deliver on cars at breaker to the Buyer, all the Anthracite coal hereafter mined from any of its mines now opened and operated, or which it may

hereafter open and operate on the premises intended to be covered by this contract, and any which shall be reclaimed from culm banks on said premises, viz:—

Shipments to be made from time to time as called for by the Buyer. The Buyer to give, on the twenty-fifth of each month, notice of the quantity as nearly as practicable Buyer will require for next month, and arrange to take the coal in as nearly equal daily or weekly quantities as in its judgment the requirements of the market will permit. The Buyer to use its best efforts to find a market for the Seller's coal so as to enable the Seller's collieries to be worked as many days as practicable, with due regard to the general market conditions, and to give orders for shipment which will enable the Seller to work its collieries as many days in each year as other collieries work similarly situated.

The Buyer agrees that it will not discriminate in favor of its own mines, or any persons, firms or companies with which it has contracts to buy coal, but that the quantity to be ordered monthly shall be a just proportion of the entire quantity of coal agreed to be purchased by the Buyer, measured by the colliery capacity of the respective Sellers. It being understood that so far as practicable the quantity ordered shall not be less than a just proportion of all the Anthracite coal which the requirements of the market may from time to time demand. The colliery capacity shall be determined as of the First of January in each year by the parties hereto, and, on their failure to agree, the President for the time being of Girard Trust Company shall select a suitable expert for this purpose. Should any market change take place affecting the productive capacity of the colliery, either the Buyer or the Seller may call for a new determination of the colliery capacity as of the beginning of any quarter of the calendar year.

SIXTH. The Buyer agrees to pay and the Seller agrees to accept the following prices for said coal, when prepared in accordance with the standard hereinafter set forth, and delivered 1 o b railroad cars at the breaker:

For all sizes above Pea coal, sixty-five (65) per cent of the general average free on board prices of said sizes received at tide points at or near New York, between Perth Amboy and Edgewater, computed as hereinafter provided.

For Pea coal, fifty (50) per cent of the general average f o b price for Pea coal at said tide points at or near New York when the said price is Two Dollars and Fifty cents (\$2.50) per ton or less, and for each advance of ten (10) cents per ton in the said f o b price above Two Dollars and Fifty cents (\$2.50) the proportion paid the Seller shall be increased one (1) per cent, until the percentage paid for pea coal reaches sixty-five (65) per cent.

For Buckwheat coal No. 1, forty (40) per cent of the general average f o b price at said tide points at or near New York when the said price is Two Dollars (\$2.00) per ton or less, and for each advance of ten (10) cents per ton in the said f o b price the proportionate price paid the Seller shall be increased two (2) per cent, until the said f o b price reaches Two Dollars and Fifty cents (\$2.50), after which the proportionate price paid the Seller shall advance one (1) per cent, for each ten (10) cents advance in the f o b price above Two Dollars and Fifty cents (\$2.50), as in the case of Pea coal above mentioned. Provided that nothing herein contained shall oblige the buyer to pay for Buckwheat No. 1 coal a rate higher than for Pea coal.

For all sizes smaller than Buckwheat No. 1 the Seller shall receive Twenty-five (25) cents per ton f o b railroad cars at breaker, and for each ten (10) cents increase in the general average f o b price above One Dollar and Thirty cents (\$1.30) a ton at tide, the price shall be increased five cents per ton; but it is understood that the Buyer shall have the option to decline to take these smaller sizes in excess of the proportion taken from the Buyer's own collieries and operations.

It is also agreed that if at any time, through changes of sizes of meshes or screens or of conditions of trade, the sizes smaller than Buckwheat No. 1, as described herein, shall be marketable at tide at the same prices as Buckwheat No. 1, the scale of prices on a basis of forty (40) per cent, when the general average f o b price at tide is Two Dollars (\$2.00) per ton or less, shall be substituted for the flat price at mines herein provided for during the continuance of such conditions.

And it is also understood and agreed that the Seller shall have the right to sell and dispose of on its own account and at such prices as it shall see fit the excess of the sizes of coal smaller than Buckwheat No. 1 when and as often as the Buyer refuses to purchase said excess of smaller sizes in accordance with the option hereinbefore contained.

THIRD. The general average f o b prices herein referred to shall be determined by a disinterested expert accountant satisfactory to both parties, to whom the Buyer shall furnish, not later than the 8th of each month, a statement of the quantity of each size sold during the preceding month, and the amount realized therefor by the Buyer at tide on all sales of each size of coal from the region, and the accountant each month shall make a true average price for each size sold at tide of all the coal from the same region, and the average prices thus obtained shall be furnished by the accountant to the Buyer and Seller, by whom they shall be accepted, subject to the right of appeal to the Arbitration Board, in the settlement between Buyer and Seller. All statistics given such accountant shall be treated by him confidentially, and the resulting averages only shall be given by him to Buyer and Seller.

It is understood that when the words f o b price occur herein the actual f o b price received is meant, without any deduction for commissions, demurrage or any other charges.

FOURTH. It is understood and agreed that the Seller shall have the right to sell or dispose of, at retail, on its own account, coal for use and consumption of its employees and others in the immediate neighborhood of Seller's colliery, provided that the coal so sold and disposed of shall not in any event be loaded into railroad cars, but shall be hauled from the Seller's colliery breaker by wagon.

FIFTH. Payments shall be made monthly in cash. A partial payment of at least one dollar (\$1.00) per ton shall be made on or before the twelfth (12th) of each month, and the balance on or before the twentieth (20th), for all coal delivered by the Seller under this contract during the preceding calendar month. Provided, that if default shall be made by the Buyer in any payment aforesaid, the Seller may, at its option, declare this contract forfeited by giving notice of such default for a period of at least five (5) days, and of its intention to terminate this contract, unless payment shall be made in the meantime; but in case of a like default of payment in the next succeeding month this contract may be peremptorily terminated by the Seller without such notice.

SIXTH. All coal shipped under this contract shall be subject to inspection under the direction of a Chief Inspector to be appointed by the Buyer, whose duty it shall be to see that the said coal, as well as all other coal coming under his jurisdiction, conforms to the following standard, viz:—

First. The coal shall be practically free from dirt as it leaves the lip screen before entering the car. Second. The coal shall be well sized and made through and over the following square screen meshes, or their equivalent, viz:—

Broken through a mesh 4" square and over a mesh 2 1/2" square.

Bgg through a mesh 2 1/2" square and over a mesh 2" square.

Stove through a mesh 2" square and over a mesh 1 1/2" square.

Chestnut through a mesh 1 1/2" square and over a mesh 1" square.

Pea through a mesh 1" square and over a mesh 3/4" square.

Buckwheat No. 1 through a mesh $\frac{1}{8}$ " square and over a mesh $\frac{1}{4}$ " square.

Buckwheat No. 2 or Rice through a mesh $\frac{1}{8}$ " square and over a mesh $\frac{1}{4}$ " square.

None of the above sizes shall contain an admixture of a larger size sufficiently great to render the coal objectionable, nor respectively a larger proportion of any smaller sizes than is usually present in good merchantable coal, and it is specially agreed that neither Egg, Stove nor Chestnut coal shall contain more than five (5) per cent. of larger sizes; that Chestnut coal shall not contain more than ten (10) per cent. of Pea and five (5) per cent. of Buckwheat No. 1; nor Pea coal more than fifteen (15) per cent. of Buckwheat No. 1 and five (5) per cent. of Rice, nor Buckwheat No. 1, more than fifteen (15) per cent. of Rice.

Third. The sizes above mentioned shall in no case contain more than the following percentages of refuse (consisting of slate, rock and fire-clay), viz.:

Broken, one (1) per cent.; Egg, two (2) per cent.; Stove, four (4) per cent.; Chestnut, an average of not more than five (5) per cent., and at no time to exceed a maximum of seven (7) per cent. Pea, ten (10) per cent.; Buckwheat, fifteen (15) per cent.

Nor more than the following percentages of bone (containing a proportion of fixed carbon ranging between forty (40) and sixty-five (65) per cent.), viz.

Broken, two (2) per cent.; Egg, two (2) per cent.; Stove, three (3) per cent.; Chestnut, five (5) per cent., Pea and Buckwheat coal shall not contain such proportion of said bone as to reduce the price below the average market price of those sizes.

SEVENTH. If the conditions of the trade shall at any time or times require a higher standard of preparation than as aforesaid, the Seller shall prepare the coal so as to conform to such higher standard, provided, however, that the Seller shall be reimbursed for any increased expense involved; and, if the parties hereto shall not agree as to the amount of such reimbursement, the question shall be referred to the arbitration board as hereinafter provided. All coal shall be inspected at the breaker.

EIGHTH. When the inspector is making a test for impurities in the coal, he shall, whenever possible, take the sample from the coal as it flows from the chute into the car. If at any time the first test is unsatisfactory to either party the inspector shall make two other tests of the coal in question, and the average of the three tests shall be final. If at any time it is necessary to test a car after it leaves the chute, a sample shall be obtained by taking equal quantities of coal from the middle and each side and each end of the car in order to ascertain the average quality of the coal tested in that car. In case the inspector shall condemn coal which is believed by the Seller to be up to the standard, the Seller shall in that case make complaint to the General Superintendent of the Buyer, and, if it is found by him to be up to the required standard, the coal shall immediately go forward, and the instructions to the inspector shall be so modified as to remove as far as practicable cause for similar complaints hereafter by the Seller. The cost of all inspections shall be equally divided between the parties hereto, except that the Chief Inspector shall be paid by the Buyer.

NINTH. It is understood and agreed that the Seller will ship to the Buyer all the coal mined and prepared at the said colliery or collieries (with the exception of coal required in the Seller's mining operations and the coal retailed at the breaker as heretofore provided), prepared according to the standard hereinbefore recited, and, in case any coal is condemned and rejected by the inspector on account of its preparation, the Seller will re-prepare the same until it conforms to the required standard.

TENTH. A ton of coal under this contract shall consist of twenty two hundred and forty (240) pounds, and all coal shipped by the Seller under this contract shall be weighed either upon scales at mines, tested and approved by the Buyer and by the weigh-masters approved by the Buyer, or upon the weigh-scales of the Railway over which it passes on its way to market, and the amount of coal in each car shall be determined by the certificate of the weigh-master at said scales. An allowance for waste shall be made of such amount as is currently allowed by the Railroad Company transporting the coal, but not exceeding one (1) per cent.

ELEVENTH. The Seller will convey and manifest said coal to such points and parties as the Buyer shall from time to time direct, and will furnish and send to the Buyer and to the consignees named by the Buyer, and to such other parties as the Buyer may direct, such copies of manifest and such notice relating to coal shipped as the Buyer may direct, and the Seller will generally do and perform all acts usually and properly attendant on and connected with the mining and shipping of coal from the said colliery.

TWELFTH. If, by reason of any strikes among the employees of either party, or by reason of injury to the works, buildings, fixtures, railroad, terminal facilities or other property of the Railway Company or Companies by which the coal is transported to market, or of either party hereto, or of unavoidable delays or obstructions in the mining or transportation of the said coal, either party shall be unable to respectively furnish or take the coal as herein agreed, such party shall not be liable for non-fulfillment of this agreement during the period of such disability, provided every reasonable effort be made to resume operations at the earliest practicable period.

THIRTEENTH. The percentage of the various sizes of coal to be delivered under this contract shall be the same as the average produced at the several collieries operated by the Buyer in the same region.

FOURTEENTH. In the event of any disagreement as to the quantity to be ordered, or the actual price of coal at tide, or any other question to be decided under the terms hereof by arbitration, it shall be determined by a Board to be known as Permanent Board of Arbitration, which shall consist of three persons, one person selected by the Seller—viz.,

the President of the Buyer company to be the second person; and

the President for the time being of General Trust Company to be the third person. The name of the person to represent the Seller shall be inserted in this agreement, or, if not named before its execution, shall be endorsed in writing on this Agreement, and when and as often, by reason of death, resignation or vacancy, or for any cause, another person shall be selected, the name of such person shall likewise be endorsed hereon, which endorsement shall have the like effect as if the name had been originally inserted in this agreement. The Arbitration Board to have full power over costs of reference, and to decide by whom they shall be paid.

FIFTEENTH. If by reason of changes in trade or colliery conditions the Seller is unable to operate its mines without financial loss on the basis of this contract, and the Buyer declines to modify this agreement, the Seller may submit the questions involved to the said Board of Arbitration, and, if the Board decides that the Seller cannot operate its mines without loss on the basis of this contract, and if the Buyer and Seller cannot agree on a modification of this contract, then this contract shall cease and determine.

SIXTEENTH. It is also understood and agreed (anything herein contained to the contrary notwithstanding) that if at any time or times the average l. c. b. price at tide for sizes of coal larger than Pea coal shall be less than Three Dollars and Fifty cents (\$3.50) per ton, then the Seller may at its option temporarily suspend mining and cease all deliveries hereunder until the said average price shall reach Three Dollars and Fifty cents (\$3.50) per ton; provided, however, that two weeks' notice of

intention to stop deliveries shall in such case be given by the Seller to the Buyer; and, if any question arises as to price being less than \$3.50, it shall be submitted to the permanent Arbitration Board.

SEVENTEENTH. This agreement shall inure to the benefit of and be binding upon the executors, administrators, successors and assigns of the parties hereto respectively.

IN WITNESS WHEREOF, the parties have caused their respective corporate seals, duly attested, to be hereunto affixed the day and year first above written.

Signed, Sealed and Delivered in the Presence of

NEW YORK CITY, February 18, 1901.

TESTIMONY OF MR. FREDERICK E. SAWARD,

Editor The Coal Trade Journal.

The special subcommission met at 2.30 p. m., pursuant to the motion for recess, Mr. C. J. Harris presiding. At that time Mr. Frederick E. Saward was sworn as a witness, and testified as follows:

Q. (By Mr. C. J. HARRIS.) Will you give us your full name and your address, and also state your position?—A. My name is Frederick E. Saward; my address, No. 41 Park Row, New York City, and my position is that of editor of *The Coal Trade Journal*.

Q. For how long a time have you been engaged in this work and been familiar with the coal trade of New York?—A. I have been publishing the paper for 31 years.

Q. Will you go on in your own way and state what the situation in regard to the use of anthracite coal is in New York?—A. I should think that the greater city of New York uses about 7,000,000 tons of anthracite coal in a year. The coal is brought to tide-water docks on the Jersey side by the different railroad companies coming from the coal regions. The Pennsylvania Railroad goes to Perth Amboy; the Lehigh Valley to South Amboy; the Reading to Port Reading; the Jersey Central down to Port Johnston, Elizabethport; the Delaware and Lackawanna to Hoboken; Delaware and Hudson and Erie to Weehawken. Those lines comprise the carriers. The individuals that you have lined out in black there [referring to a map] ship their coal over those several lines accordingly as they are situated most favorably in those regions that are marked out [referring to the map]. The lines go to those several shipping points. The Lehigh coal naturally flows down to Perth Amboy and to Port Johnston. The product of the Schuylkill district runs to Port Reading. The northern district pulls into Weehawken, Hoboken, and during the summer season to Newburgh.

Q. Who are the largest producers of anthracite coal for this market?—A. I think the Reading puts in the largest portion of the coal, of the harder coal; the two Delawares, the Erie, and the Pennsylvania Coal Company what we call free-burning coal.

Q. How is this coal marketed, by the independent operators or by the railroads?—A. By both. The railroad companies have their wholesale agents here in town, and some of the individual operators sell their coal to what are known as commission houses in the trade for sale again.

Q. Do the railroads buy coal of the independent operators and ship it and sell it themselves?—A. In a large degree; the coal that is called independent is now sold to the several railroad companies at the collieries.

Q. There are independent operators who do not sell to the railroads?—A. There are a few; yes.

Q. Who are some of them?—A. John C. Haddock is one of the largest.

Q. (By Mr. KENNEDY.) On what line does he ship?—He ships over the Delaware, Lackawanna and Western.

Q. Is he given cars freely to send as great production to tide water as he desires to send?—A. Perhaps that would be better answered by himself.

Q. (By Mr. C. J. HARRIS.) Do you know of any complaints among independent operators of failure to get plenty of cars for shipment, or anything of that nature?—A. No; I guess not. Practically, in the coal trade there is always a season, both

in hard and soft coal, when there is complaint that cars can not be had in sufficient number, and all that sort of thing, but that is soon over; that occurs usually in the fall of the year. Soft coal people ship to the lakes and to the seaboard; anthracite people ship to the West, and all that sort of thing; so they can not get cars enough. That is not a subject of general complaint in ordinary times.

Q. Would you say what proportion of the anthracite coal used in New York, or shipped to New York, comes from independent operators?—A. No; I could not answer that question offhand.

Q. Is it not a very small proportion?—A. Oh, yes; naturally, it is a very small proportion. The independent operators, taken in the aggregate, possibly represent one-fifth of the production, of which part is sold directly by them to the companies. That leaves a very small proportion that is independent.

Q. (By Mr. CONGER.) Can you tell what the economic or business reason is for these railroads going into the coal business? In other words, why is not coal produced by independent operators, the same as wheat is grown or lumber manufactured or any other of the great products or great items of railroad transportation produced?—A. Well, a reply to that question— that takes you back to ancient history, the history of the industry.

Q. Can you give that in a short way, if there is any salient reason for it?—A. I should say that in the last thirty years, or nearly, it has not been practicable for many individuals to go into the coal business as producers of coal. In those early days, when the mines were little bits of what we call rat holes—little bits of properties that produced perhaps 100 to 150 tons of coal a day—individuals were in business, a great many of them men of small capital. The business did not require very much capital. They soon played out, and, in order to furnish transportation to the railroad companies that were built into the districts, the railway companies themselves, or their friends, or mining companies, went into the securing of these properties round about, which you see there [pointing to map], in order to have traffic forever for the railroads that were built to carry on the business.

Q. (By Mr. C. J. HARRIS.) Are most of these anthracite coal lands now already owned by the different coal roads or the subsidiary companies?—A. Yes; very largely indeed.

Q. They virtually control the situation, do they?—A. They virtually control the situation; to put it that way, yes.

Q. (By Mr. KENNEDY.) Do the railroads in the soft-coal fields control the bituminous production and output to such a degree as the anthracite production is controlled by the so-called coalers?—A. Yes; I should think even more so.

Q. The soft coal coming to New York over the Pennsylvania Railroad, for instance, is that coming in as the property of the Pennsylvania Railroad or of the independent operators?—A. Of the independent operators. The Pennsylvania Railroad does not operate any collieries at all.

Q. Well, soft coal would come in over other railroads to New York, would it not?—A. Soft coal is coming to tide water over the Baltimore and Ohio, Chesapeake and Ohio, and Norfolk and Western and producers mainly in the soft-coal districts pool their issues; then they come to market, and the coal is sold by one concern in town.

Q. Then the coal comes in, not as the property of the railroads, but of the producers?—A. Of the independent producers, not of the railroads; they have but one general agency. The Norfolk and Western has one; the Chesapeake and Ohio has one.

Q. Have you in your mind the figures for the transportation of coal—hard and soft—in mills per ton per mile?—A. No; we do not concern ourselves with those facts in the coal trade in our paper any more. That is a thing that has gone by. We used to have at one time what you might call schedule rates of transportation of hard coal; but, as has been said, the bulk of the coal is the property of the railroads. They make the division as they see fit. The coal of the individual operators which is still brought to tide water is carried on the basis of 40 per cent of the tide-water price, so that the individual operator is just as anxious to get a high price for his coal as one can be. The proposition that they made last year, when they had that independent road under way, that they were going to be friends of the public and sell the coal for \$2.50, was simply to get a right of way, that is all. They are interested in getting a high price for coal. Forty per cent of \$4 is \$1.60; that leaves them \$2.40 for the coal at the mines. Forty per cent of \$3 is \$1.20; they get \$1.80 on that basis.

Q. I have been informed that the rate for carrying hard coal to tide water is something like 10 mills per ton per mile, and that the charge for carrying soft coal is 2½ mills per ton per mile. Now, you should be familiar with that subject. Can you say whether there is any such difference as that between the charges?—A. One hundred and sixty cents, the average for 100 miles, is 10 mills—a cent a ton a mile,

isn't it? That is a mathematical calculation easy to be proven. The soft coal that is brought to tide water is carried for less money; but they are two different items, and they do not enter into competition at all.

Q. Is it true that they do not enter into competition at all?—A. It is.

Q. Is it not true that in the past, when the price of anthracite coal has been put up to a pretty high rate, that soft coal has been induced to come in for that market?—A. For what purpose?

Q. Well, for general purposes.—A. It is not used for general purposes. You do not burn soft coal in your house. Some of the minor grades of anthracite coal have latterly been pushed as steam coals. Up to within a few years those were all thrown on the dirt bank, as they call it. Now we are going through the problem of reclaiming the dirt bank, or shipping as much as we can of the product of the mine to market, without sending any to the dirt bank. Those junior sizes are brought into the market and sold for a price.

Q. (By Mr. CONGER.) They compete with the soft coal, do they not?—A. They generally sell for less money. I do not see that there is any competition in that when soft coal is worth \$3.50 and they sell that for \$3.

Q. Was it not proposed to use soft coal in the city of New York in manufacturing at the time of the strike?—A. Soft coal was used; soft coal is used in this town; soft coal is used here constantly; a large amount of soft coal is used here. Soft coal can be burned here or anywhere else without making a smoke nuisance of it. The health code does not say anything about the nuisance of soft coal; it is only that it shall not be used so as to make it a nuisance to anyone. That is all that the section in regard to the burning of soft coal is: that it must not be used to make a nuisance. Soft coal can be burned. Soft coal is burned all over the United States, you might say, without being a nuisance.

Q. Do you know what percentage of the product of the output of the anthracite mines is now used for steam purposes?—A. Perhaps 25 per cent.

Q. Would it be as high as 40 per cent?—A. No. I don't think it would. We used to take about 40 per cent, but in the changes of the trade we are gradually making domestic coal of pea coal that used to go into these small sizes and be thrown away or used for steam at the mines. Trade is changing continuously.

Q. Well, if soft coal is used generally for steaming purposes, and some of these junior sizes of hard coal are sold to a man who uses it to make steam with, does it not come into competition with the soft coal?—A. I do not consider that they come into competition at all. I think they both have their use and value. I do not put them parallel, coming into competition with each other.

Q. Do you think there is any connection between the prices at which the two kinds of coal are sold?—A. The prices are regulated by the demand. That is all that you can say. Last fall the junior coals were in very, very short supply, owing to the strike. The strike lasted 6 weeks, our stock of small coal was eaten up.

Q. Did not that circumstance increase the consumption and, naturally, the price of soft coal?—A. It made a demand for soft coal, and in some instances the price was advanced.

Q. What is the present price of the domestic sizes of this hard coal at tide water; do you know?—A. About \$4.25 wholesale.

Q. And the roads get 40 per cent of that amount for the haul?—A. The railroad gets 40 per cent.

Q. (By Mr. C. J. HARRIS.) That means delivered on the other side of the river?—A. Yes.

Q. What other terminal charges are there to get it to New York and Brooklyn?—A. The terminal charges are covered by the rate of freight, as it is called, for the boatmen, whose boats go to the Jersey side and bring the coal over to New York and Brooklyn.

Q. About how much would that charge be a ton?—A. About 20 cents.

Q. (By Mr. CONGER.) You say the present price is about \$4.25?—A. About \$4.25 wholesale; yes.

Q. Do you know what it averaged last year approximately—is it higher now than it was a year ago?—A. No, I think not. I think I could make the statement that practically the average to-day is about the average of last year.

Q. Is it higher now than it was a month or two months ago?—A. No; two months ago there were some spot cargoes of coal selling for \$5.50.

Q. Is it higher now than it was—say, five years ago—in 1895 or 1896?—A. Yes; I reckon it is, and it will be higher.

Q. Have there been many changes in the past five years in the price of this coal at tide water?—Yes; prices have changed very much, indeed, even within a year—in a year's time, that is; not within the past year, but within twelve months' time, you know.

Q. How wide has the fluctuation been?—A. Fifty cents at least, possibly 75 cents.

Q. Not more than 75—there has been 75?—A. I think so; say from the spring prices to the winter prices.

Q. That change in the price has been on account of seasons particularly?—A. On account of the seasons. They all sell at low price in the summer.

Q. How low a price have you ever known at tide water for coal?—A. Two dollars to \$2.25.

Q. You have known it as low as \$2 and \$2.25, as against \$1.25 now?—A. Yes.

Q. What reason do you give the commission for that radical change in price?—A. To reply to that question it is necessary to go back to the date of the auction sale in 1876, in Hanover Square, when they sold 500,000 tons of coal. The price began to go down, and the people had the coal at their own price. Coal was sold within half an hour after the sale was over at \$1.50 advance by the people who bought it there. So that sale is no criterion. [In 1879 there was another low range of sales at auction.]

Q. That price, then, of \$2 was an extraordinary price?—A. You asked how low coal has sold. Coal has sold as low as \$2 a ton in this harbor, but a comparison between that price and \$1.25 would hardly be fair.

Q. What would be a fair comparison between the price now and that of twenty years ago?—A. I think they sold coal for \$6 twenty years ago, during the whole season.

Q. Six dollars at tide water?—A. Yes.

Q. Perhaps I should have said twenty-two years ago; that was after this low period, or the period of low prices.—A. That was the period of low prices, due to overproduction—throwing too much coal on the market.

Q. In your opinion the low prices of twenty-two years ago were occasioned by overproduction?—A. Yes.

Q. (By Mr. C. J. HARRIS.) What was the average price of the coal at that time compared with now, leaving out this—this auction sale; this one item?—A. Well, I venture to say we were getting from \$4 to \$5 a ton.

Q. About the same as now?—A. Yes.

Q. Has there been an improvement in the use of machines in mining that would lower the cost of mining since then?—A. No; on the contrary the expenses are greater.

Q. Do they use any coal machinery in mining in anthracite mines?—A. No.

Q. The price of powder has materially declined since that time, has it not?—A. Yes; we thrashed that question over last fall. The price was \$2.75 some 20 odd years ago. Powder can be had now for \$1.50 a keg.

Q. Is powder an important item in anthracite mining?—A. No, not a very large item. They use something like 1,500,000 kegs of powder, and about 4,000,000 pounds of dynamite; they get out about 60,000,000 tons. We are working coal at greater depths to-day than 15, 20, or any other number of years back. We have more water to pump; we have thinner seams.

Q. (By Mr. KENNEDY.) You said the low prices of this period you spoke about, when coal was sold in Hanover Square, were due to overproduction. Is the production regulated now so that there is no overproduction?—A. Do not think there is any regulation to-day at all. Sometimes I wish there was. It would keep the trade in better shape. Trade is always in better shape when the production is even and the price is even throughout the year. If that could ever be done, if we could divide the tonnage into 12 monthly proportions, we should have trade in very much better shape. We are producing to-day at the rate of something over 60,000,000 tons a year. Last month and December we have been running at the rate of 5,000,000 or 5,250,000 tons a month. Well, the market won't take 60,000,000 tons of coal, so there must be some months during the year when we must reduce that production. Now, if you call that regulating the coal trade, there you are; that is all I can say.

Q. Can you say how much difference there is between the price of coal now and the price in the recent years of depression—1893 to 1896 and 1897?—A. I think the market is in very much better shape so far as prices are concerned, but I think that condition is entirely due to the increased demand for coal.

Q. I wanted to know if the price went down to anything like it was at this period you spoke about when the auction sale occurred; if it was so low or if it remained comparatively steady and strong during those years of depression.—A. If we had again a period of depression, the price would be reduced, I have no doubt. In 1893, 1896, and 1897, it was pretty slow business everywhere.

Q. How much fluctuation is there in the total consumption of coal between those years, for instance, as between a poor year—1893-94-95—and a good year preceding or following?—A. That is, in the consumption of coal for domestic purposes?

Q. Yes.—A. That is an economic question, isn't it—a social economic question? It is very interesting, too. I have looked into it a good deal myself. I should think about 15 per cent.

Q. (By Mr. CONGER.) It might be well if Mr. Saward would say what the total consumption is now, approximately.—A. We are working to-day at the rate of 60,000,000 tons a year; that is, of anthracite coal. That is the production.

Q. And what do you estimate will be the consumption?—A. If we have a continuance of the demand of these last three months, it is all going to be burned up. There is no stock on hand anywhere to-day. In addition to that you must understand we are producing about 180,000,000 tons of bituminous—just about three times as much.

Q. Yes; but you testified that the consumption of bituminous coal, in your opinion, at least was not affected by the consumption of anthracite coal.—A. It is not. One does not affect the other, practically. I only gave you that fact so that these gentlemen might not think that anthracite coal is "the only thing." We get something else besides anthracite in the United States. We have 240,000,000 tons of coal this year, which beats Great Britain by about 15,000,000 tons. We have the greatest country in the world to-day in coal production, as we have in almost everything else.

Q. Do we export any of this anthracite coal?—A. Our best outside customer is Canada, which takes about 1,500,000 tons.

Q. I was referring to the European trade.—A. Across the water? No; we do not send any anthracite to Europe.

Q. Do we have any export trade in soft coal?—A. We have. We are increasing very largely in soft coal. You can not send any anthracite abroad till you send people over there with stoves, and show them how to burn anthracite coal.

Q. You testified the price now at tide water was about \$1.25 a ton?—A. Yes.

Q. Is that price practically uniform for the same grade of coal between the different producers or people who have it to sell?—A. I understand it is. That is the price.

Q. And the price is the same with all of them, practically?—A. For that grade of coal. There might be some discount—a few cents.

Q. How is that price fixed?—A. A man comes to the office who wants to buy five cars of coal. "What is the price?" he asks. The price is given him. He won't give it. He then goes down to Tom Jones and inquires, "What is your price?" Perhaps he is told \$4.25. He then goes back to the first man, if he feels like it. There is no such thing as fixing the price.

Q. The dealers will ask the same price, it seems?—A. Certainly they do, because each knows that his coal is worth the same money as the other man's.

Q. Do you think there is any union of action there—any agreement between them?—A. I do not think there is any agreement between them. They understand the value of their product. One man is not going to sell his for less than the others, because he says his is just as good as the others'. I do not think there is any cut-iron agreement, or anything of that kind.

Q. Is there any tacit understanding?—A. You will have to ask some of the gentlemen connected with the business for that information. If they have any understanding, I do not understand it to be so—that there is any tacit understanding. Some of these gentlemen connected with these companies, if they were brought before you, might answer the question yes or nay.

Q. (By Mr. KENNEDY.) I have often read in the New York papers that there was an anthracite-coal trust, and I have heard people testify to that effect. You should be an expert in that subject, conducting The Coal Trade Journal, and I should like to ask you whether there is an anthracite-coal trust or anything that partakes of the character of a coal trust?—A. I do not know that there is.

Q. Would you say that there is not?—A. Who are these gentlemen who testify that there such a thing as a coal trust?

Q. Well, an independent producer is the gentleman I have reference to.—A. What is the definition of the word trust?

Q. I will call it combination. I know your technical point there.—A. No; I do not want to ask you any questions there at all. I only want to use that means to enlighten you as well as some of the others who say that there is such a thing as a coal trust. Now, in order to have a trust or agreement there must be parties to the agreement.

Q. (By Mr. RIPLEY.) Is it not true that a large number of the coal-carrying roads are owned by the same people?—A. It is true that a very great many of our rich people to day are interested as shareholders in the various anthracite coal-producing and coal-carrying companies.

Q. Are not the same men directors in a number of these companies?—A. To a considerable extent. You will find that the Vanderbilts and the Rockefellers, one and another, are interested in these various companies.

Q. Can you state which of the companies apparently have the same men as directors, so far as your knowledge goes?—A. You will have to get Poor's Manual and work up those details from that. I could not tell you offhand.

Q. Is it not a fact that the Lehigh Valley, and the Erie, and the Reading, and the Central of New Jersey are supposed to be more closely united than the other roads?—A. There is where you get community of interest, in that several people are in those various enterprises; yes. If that is what you call a trust, combination, there you are. I do not call it so. As I said before, I have known this trade about 40 years, and I have been running the paper 31 years, and I have seen trusts or combinations, one thing and another of that sort, too often. I do not call this anything like a trust or combination that we have to-day. It is not like we had—a little bit of ancient history—in 1874. Then there was a meeting; an agreement was come to that such and such things should be done, and if other things were not done there should be a penalty. That agreement went to pieces of its own weight in 1876.

Q. Was there not another attempt in 1886 or 1887?—A. It ran along from 1886 to 1888.

Q. Yes, and was there not another attempt made in 1893?—A. No, no; 1891 and 1892.

Q. Under the leadership of what road?—A. Mr. McLeod tried to bring about a combination.

Q. And what was the cause of the failure?—A. Invading the territory of some of the other railroad magnates when he crossed the Hudson River.

Q. Will you give in somewhat greater detail your opinion in the matter as to the cause of the failure of that attempt to consolidate the anthracite coal roads?—A. I do not think it received the financial support that Mr. McLeod expected; I think that was the primary reason.

Q. If there had been sufficient financial support at that time, such a combination might reasonably have taken place?—A. That was a combination that ran the price of coal up \$1.75 a ton inside of 5 months.

Q. What was the relation between the roads, which took place in that combination; was it in the nature of a purchase or a lease?—A. Those were leased roads at that time.

Q. What has taken place recently between the Reading Railroad and the New Jersey Central? Have you any knowledge respecting that point?—A. As I understand it people connected with the Reading Company have bought sufficient shares in the Central of New Jersey to acquire the commanding interest there.

Q. Has it been an actual purchase? Have they bought stock, or have they actually purchased the road?—A. No; bought shares of stock.

Q. But leading virtually to the purchase of the road?—A. The transaction might lead in that way. The man that owns the stock owns the road, if he has enough of it.

Q. In other words, would this meet the situation—that in 1893 they attempted to combine by leasing, and in 1901 they attempt to combine by purchase?—A. Several of these people have increased their holdings in all these other lines, and in that way secured the control.

Q. (By Mr. CONGER.) Such a community of interest between these railroads might be a very good reason for asking the same price for coal, might it not?—A. That would be. There will be no higher price asked for coal. It would be the greatest fallacy for these gentlemen to attempt to get any more money for coal than the prevailing price.

Q. In other words, you think the present price is high enough?—A. The present price is a fair price. The present price is a profitable price. At the present price there is no danger of a decreased consumption unless they strike a bad year. If they are so unfortunate three or four years hence to get back some of those bad years like 1893 to 1896, the consumption of coal will be decreased from natural causes; but there is nothing in the situation from the trade standpoint to warrant any advance in price, and there are very good trade reasons for saying the price should not be higher.

Q. (By Mr. KENNEDY.) Perhaps economic reasons will prevail, but if this community of interest scheme is carried to a successful conclusion, will they not have it in their power to put on arbitrarily the very last penny that the public will stand for coal?—A. Now, I think I have answered that question in my own way. "The very last penny that the public will stand for," you put it in that way. Now, I said, for very good trade reasons they should not increase the price beyond what it is at the present time. So that I think you are putting it in one way; and I put it in another. I would say no to that question; there is not any probability of such a course.

Q. You say they would not have the power?—A. They might have the power, but they would not exercise it.

(By Mr. RIPLEY.) What proportion of the total tonnage is produced by the Reading road, can you say, approximately?—A. Of last year's tonnage it was about 21 per cent.

Q. Is that greater or less than its proportion of the tonnage 10 or 20 years ago?—A. O, I think the Reading was running about 20 per cent even in those days.

Q. Did it not run as high as 43 per cent on paper at one time?—A. No; 42 per cent when they had that Jersey Central-Lehigh Valley lease, was it not? Not the Reading of itself.

Q. Has not the allotment to the Reading, made 10 years or so ago, been at least as high as 30 per cent or 33 per cent?—A. No; I have no such recollection; I don't think you could find confirmation of that opinion in the statistics.

Q. Testimony to that effect was offered in 1892 before a committee of the House of Representatives.—A. That allotment must have included the Lehigh Valley or the Jersey Central. That is, when those roads were leased, you know.

Q. Was there then any change in the relative proportion of the coal produced or shipped by the different roads?—A. There has been very little, indeed, in the last 10 or 15 years.

Q. Have not some new roads come into the territory within the last 10 years?—A. Yes; we have the Ontario and Western, and the Delaware, Susquehanna and Schuylkill. Those are two new roads.

Q. Would the Erie and Wyoming Valley come in there?—A. Oh, yes; the Erie.

Q. The Erie and Wyoming Valley?—A. That is a part and parcel of the Pennsylvania Coal Company.

Q. Yes, or was it sold at the time the Pennsylvania Coal Company was sold to the Erie Railroad?—A. I understood so.

Q. And is operated by the Erie Railroad?—A. Yes; operated by the Erie.

Q. You say the relative proportions of coal shipped by these roads is not changing much at the present time?—A. It has not changed very much in all these years.

Q. Suppose one of the roads were to ship more than the usual or customary percentage, what would happen? Suppose, in other words, that the Reading roads would begin to ship 30 per cent of the total output?—A. Thirty per cent, being entitled to 21 per cent?

Q. What do you mean "being entitled to 21?"—A. That is the proportion of the tonnage; that is the way it works out.

Q. Do you mean anything specific by "being entitled to 21 per cent?"—A. The coal shipments are divided up into percentages.

Q. Is that division made at the present time?—A. Their proportion is, they say, 21 per cent.

Q. Who says 21 per cent?—A. Well, I say that is the way it figures out. If you take last year's production, their tonnage is 21 per cent of it.

Q. Is the Reading Railroad producing up to its maximum capacity? Could it not produce much more coal than it does at the present time?—A. You would have to ask Mr. Luther, of Pottsville, that question; I wouldn't answer it.

Q. Your statement is, then, that this proportion of tonnage to each road is purely a result of chance?—A. Not of chance at all. It is controlled by what they do in each year.

Q. Whom do you mean by "they?"—A. The several companies.

Q. They come together, then, and agree upon allotments?—A. No; there is the production last year of 47,000,000 tons; out of that the Reading gets 10,000,000 tons. That works out something like 21 per cent, and the others work up to their several percentages.

Q. But it could produce more?—A. It could produce more; it has the colliery capacity.

Q. You think the anthracite properties generally could produce more coal than they do?—A. Yes; they could all produce more.

Q. Suppose any one of them should attempt to produce more than the allotted proportion what would happen? Would there be any safeguards for the other roads? Suppose, in other words, one of the roads should attempt to double its output in a given year?—A. Don't ask such foolish questions as that. Why should they attempt to double the tonnage; they can't sell more than so much coal?

Q. So much is sold as a total in a year, but one company might increase its proportion of that total, might it not?—A. Do you mean to ask whether a given company has the capacity for doing more?

Q. Certain of the roads have come into the field in the last ten years and have built up a trade of their own, have they not? You mentioned the Ontario and Western.—A. They have taken care of the increased tonnage that has been demanded.

Q. (By Mr. CONGER.) You say these roads could produce more coal; why don't

they do so?—A. Because they can't sell at a profit. Why, it is like that chapter in Henry George's Political Economy where a man sells 100 things for one price, and if he increases the quantity by 10, the increase has an effect not only on that 10, but on all the rest. I have noticed it many times in the last number of years when they produced too much coal.

Q. (By Mr. KENNEDY.) It would look as if there was an agreement, then, if some of them did not produce up to something like their maximum producing capacity, to keep the production down?—A. I gave you information on that point. I said that during this month and last we have run at the rate of 60,000,000 tons a year, and when it comes summer time we will have to reduce. We can not sell 60,000,000 tons at any price in this market.

Q. (By Mr. RIPLEY.) What do you mean by "their tonnage," referring to the Reading company?—A. Their proportion or percentage that has been divided in the course of years, 20½, 20½, 21½, 20½, or what it averages for 5 years.

Q. Does the Pennsylvania Railroad participate in a proportionate arrangement of that kind?—A. Never.

Q. Why not?—A. I do not know.

Q. Can you give any answer why it does not?—A. Simply because it has been a free lance.

Q. Free lance against what?—A. Against the rest of them.

Q. Has their proportion remained fairly constant?—A. I think so.

Q. About what figure?—A. About 10 per cent: 9, 10, 10½, 11.

Q. Is it not true that at various times when the companies did agree formally upon prices, that the Pennsylvania Railroad refused to accede to such an agreement?—A. I think you will find they have always refused.

Q. Always stayed outside of any agreement? The agreement, then, between roads as to such allotments and of prices which were formerly made does not exist?—A. I do not know of any agreement at the present time.

Q. But there was one formerly, say 10 years ago?—A. Yes; we have had several in the last 30 years.

Q. (By Mr. C. J. HARRIS.) Has there been an increase in the price of coal—an unusual increase in the price of coal in the last 5 months—1 or 5 months?—A. Eliminating that period of the strike and shortly after it. No.

Q. Are prices about where they were last winter at this same period of time?—A. I think so.

Q. I should like to ask if you know anything about the condition of labor in the anthracite mines?—A. At the present time, since the resumption of work after the strike, labor has been better employed at the anthracite mines than at any time during the past 20 years. There has been more constant labor, the wages received have been better, and the outlook is for a continuance of such good conditions during the present year, with the possible exception of a little less demand during the summer months of July and August, as usual.

Q. (By Mr. RIPLEY.) Have you any data as to the cost of the production of coal at the mine mouth in different parts of that territory?—A. No; I have not. I have seen so many statements in the last 30 years that it is hardly worth while to make an answer to that question.

Q. Are not some of those figures published in the companies' reports?—A. I think there are figures published in these reports; but if so, you can divide the amount of dollars of the cost by the number of tons produced and thus get a certain figure as to the cost per ton.

Q. You have reason to suppose they are reliable?—A. I think all such reports are misleading, whether a man makes his price \$1.10 or \$1.64, or any other price. It is so because I do not think that they charge up against the mining cost all the items that should go to it.

Q. You mean, in other words, that certain items which are charged against the mining cost really belong to the railroading cost, or vice versa?—A. No; I think it would be directly the other way, that certain items have gone into the improvement accounts that ought to go to the actual cost account.

Q. Will you specify, not by name or particular company, but by naming the item for the sake of the record?—A. In some of these statements when you find people inclined to talk about what they have done in the past years, and so forth and so on, they make the cost all the way from \$1.10 to \$1.64. I have seen other people make it from \$2.10 to \$2.46. One might be a first rate year and the other a bad year; one man would charge up one thing to an account and another man nothing to this account.

Q. Can you state what proportion roughly of the cost of coal is due to labor at the mine mouth—a mere approximate figure?—A. A ton of coal in a car underneath the breaker ready to be shipped to market, what proportion labor is getting out of that price, whatever it may be?

Q. What proportion of the cost of producing goes to wages?—A. Eighty-five per cent.

Q. And what increase in the price of coal has taken place since the strike last year?—A. Increase in price?

Q. The price of coal is higher at the present time than a year ago.—A. Higher than it was before the strike?

Q. Yes.—A. September was a low time. We had gone through July and August, and the strike was started on the 17th of September; we were at a low ebb of prices. Then we had a strike and the strike put up the prices.

Q. How much?—A. Two dollars. Coal sold here at \$6 owing to the scarcity, etc. People bought it at \$4 or less, and sold it again at \$6; but after the strike was over and there was a resumption of work and tonnage came through rapidly the price was perhaps 50 cents a ton better than it had been during the months of July and August.

Q. Better than it had been during the corresponding months of preceding years?—A. No; I do not think quite up to that point.

Q. Is it higher this February than one year ago at this time?—A. I think it is.

Q. By about how much?—A. Twenty cents or 25 cents. On the general conditions, I will say about 25 cents better.

Q. And what proportion of that increase of 25 cents is due to the fact that wages are higher?—A. Take 85 per cent at the mine; the increase in wages was from 13 to 16 cents a ton; so I am not very far out of the way. I said 85 per cent; you might modify that a little. But you know in addition to the wages of the miner you have a great many other items that go into the cost per ton. Now, here is a question of employment in your plan of inquiry; "the number of children employed;" who said there were any children employed?

Q. (By Mr. C. J. HARRIS.) Well, what do you say—are there or are there not?—A. The law of the State of Pennsylvania says that no one should go below ground who is less than 14 years of age.

Q. Well, are there children employed over 14 years of age?—A. Below ground? Boys? Yes; but very few. They are simply door boys.

Q. (By Mr. CONGER.) Considerable of this hard coal is shipped West, is it not?—A. No. You can not say "considerable;" 10 per cent is not considerable.

Q. Is that all that is shipped West?—A. Yes, sir.

Q. Is not Buffalo quite a market?—A. 2,000,000 tons are the figures for the year.

Q. Are you familiar with the prices of coal at those Lake Erie ports?—A. Yes, sir.

Q. Summer prices there are usually lower than late fall and winter prices?—A. Yes.

Q. About a third difference, is there not?—A. The same difference that prevails round about here: 50 cents a ton is the range.

Q. Usually 50 cents a ton?—A. Yes.

Q. Now, about what time does that change, or the increase in price, usually take place—the 1st of October?—A. The 1st of October, call it, last year; but we had a strike last year.

Q. That interfered with the regularity?—A. Yes; upset the regularity.

Q. Is it or is it not a fact that when the increase from summer to winter prices on coal takes place it takes place with all dealers and all producers on the same day?—A. No; I am sorry to say it does not. There are a lot of "suckers" out there that don't change their price. They have a lot of old orders on their books.

Q. (By Mr. KENNEDY.) Don't the dealers in the distant cities receive word upon the same day—all of them—that the price has changed?—A. Oh, yes; there is a circular issued—a circular that prices are so and so. Why, there is some coal going up there now that they claim was sold last summer.

Q. (By Mr. CONGER.) Who makes this claim, the dealer?—A. The dealer.

Q. Is this dealer you refer to acting independently or acting for a producer of one of the railroads?—A. I guess he is acting for himself. He does not give the producer a chance. He claims he has contracts at last year's prices which are still good.

Q. Is it or is it not a fact that on a certain day all of these producers raise their prices to the wholesalers and to the jobbers? Is it not usually the case that the increase from the summer to the winter price takes place with all producers at a fixed day?—A. Circulars are issued by one and another, and if you are a dealer in town, the first or second mail after the first of the month you are apt to get a half dozen circulars and the prices quoted will be all alike.

Q. How can you explain this uniform action if there is no agreement?—A. Oh, I don't know. It is the advance in civilization, I guess. Possibly it is the hypnotism that prevails—the unity of minds; all think alike. I do not know but there is a telephone that might be used by somebody to ask, "What are you going to ask for coal? I have my circulars all at the printer's, and I am ready to send

them out. I am going to ask so and so." "All right," might be the response: "I will ask the same."

Q. (By Mr. KENNEDY.) Community of interest fellows, they are?—A. Yes; there is a mutuality of interest.

Q. (By Mr. CONGER.) You would not call that a combination, however?—A. No; I would not call that a combination. I'll tell you why I would not call it a trust or anything of the kind—because there might be somebody who would say, "No, I won't put up my price; buyers all go somewhere else." Such things have been known even within the last twenty months.

Q. (By Mr. RIPLEY.) Can you specify a time at which that happened within the last twenty months?—A. No: I do not recall a specific time at which that happened, but as a general thing there have been times when dealers wanted to put the price up and it would not pay to put it up.

Q. That is, those who wish to raise the prices have to keep at level with those who refuse to raise?—A. With those who refuse to raise.

Q. And has the Pennsylvania company always refused to go into such an arrangement?—A. Yes; I think the Pennsylvania has always been on the outside, as the saying is; but there are shippers down here who have coal to sell, and they generally come pretty near the market.

Q. (By Mr. CONGER.) This communication by telephone or wireless telegraphy, whatever you might call it, answers the same purpose as the combination would, does it not?—A. It seems to be a wonderful invention; it beats writing on a piece of paper and putting a signature to it.

Q. In what way does it beat it?—A. No record kept.

Q. In other words, if there were a record kept, would it be an illegal combination, conspiracy, or something of that kind?—A. So construed by a good many lawyers in Congress, you know.

Q. It might be conspiracy in restraint of trade?—A. It might be.

Q. But if it is done by telephone or wireless telegraphy it is not? That is the advantage, I suppose.

(No reply by the witness.)

Q. If this uniformity of action did not take place, in your opinion would not the price of coal be less? In other words, there probably is not free competition at all times now, is there? They do not cut each other's throats very much at the present time?—A. No; they are not cutting each other's throats. It is a good thing they are not. If there was not some understanding as to what this coal should sell at, the consequence would be ruin—ruin to the State of Pennsylvania, to the principal industry of the State, and to the mining and shipping of anthracite coal. The railroads would go into bankruptcy, once more in the hands of receivers. The Reading has been in the hands of the receiver several times within my knowledge, simply on account of that free and open market that people are talking about.

Q. You do not believe in a free and open market?—A. At the time coal sold at \$2.00 that was a free and open market. We had a combination then, but the parties to it could not agree. Some fellow was shipping more than his tonnage. They said, "All right; we will find out what the market price of coal is," and they put it up at auction. They found out what the price was. It was only that price for half an hour. As I said, it afterwards sold—the same coal—at an advance of \$1 and \$1.50, and the market price of coal that day was not really \$2.00, but \$3.50.

Q. I will have to ask you what was the market price that day?—A. It was the average price obtained for the whole lot—nearer \$3.25 than anything else.

Q. Your idea is that the fact of these coal roads going into the hands of receivers, as many of them did a few years ago, was caused by competition, by this free and unrestricted competition we hear so much about, and that this competition is not a good thing?—A. Not a good thing. How many times has the Reading been in the hands of a receiver in the last ten years?

Professor RIPLEY. I should say, on a guess, you are right in your estimate of five or six times.

Q. (By Mr. C. J. HARRIS.) Was that condition entirely caused by the low price of coal?—A. I think so. Coal was their principal tonnage—anthracite coal.

Q. But was not the road overcapitalized?—A. It has not paid a dividend in a great many years, so it would not be from paying out dividends.

Q. The road might be overbonded or overstocked?—A. As long as it doesn't pay any dividends, why, you can't say it is due to that cause. If they had been paying, as some of these people were paying, 10 per cent dividends, 12 per cent dividends, long years after they ceased to earn such, then you might say that it was due to that sort of thing that they failed.

Q. (By Mr. RIPLEY.) Are there not a number of these roads that hold territory

for future development, and which they are not mining at the present time?—A. Not a number of them.

Q. Not a number of them? For instance, the Reading Railroad in the Schuylkill region. Is it mining from all its extent of territory?—A. That company has coal for 100 years.

Q. When was that land purchased?—A. In the seventies, I think.

Q. And it has been undeveloped, a large part of it, since that time?

(No audible response by the witness.)

Q. What has paid the interest charge on carrying that amount of undeveloped property?

(No response by the witness.)

Q. Has that holding been an influence in putting this road in the hands of a receiver—the carrying of such a large amount of undeveloped land with a debt on which it has to pay interest?—A. You must say they issue bonds to pay for that property? If they issued stock they would not have to pay any interest, would they?

Q. I asked you the question.—A. I am asking you another.

Q. Did they issue any security, either stocks or bonds, for the purchase of those coal lands?—A. They must have issued bonds for it; they must have issued something for it.

Q. And is not that land carried at the expense, to some degree, of the present consumer of coal? In other words, is not the present consumer of coal paying the carrying charge on the investment for the next one hundred years?—A. You might say yes to that question; then the next thing to be answered would be, How much does that amount to per ton? or else it is not a fair question.

Q. Have you any means of judging?—A. No, I have not; but I should think it was not very much.

Q. Can you state what the debt of the Reading Railroad is at the present time, approximately?—A. I think its stocks and bonds approximate about \$150,000,000.

Q. And can you state about what proportion of the total coal territory of the Reading road is being developed and worked at the present time?—A. I can not; because it is working out some of its territory every day and every year. Understand, coal does not grow; we've got to have it for the future. Ten years hence some people up in the northern district won't have a pound of coal; then you will be glad the Reading has it.

Q. Are there any other companies carrying undeveloped coal lands at the expense of present earnings?—A. To a very small degree. The Reading has by far the greatest bulk.

Q. When was that purchase of land made as a whole?—A. I think it was made in the early seventies, under Mr. Gowan.

Q. Were any further purchases made to any large extent under the management of the years 1890 and 1893?—A. Very little indeed; very little.

Q. Is that coal in the southern territory as accessible, and can it be mined as cheaply as coal in the Wyoming region?—A. No.

Q. And for what reason?—A. The coal lies deeper.

Q. Is it of equal quality?—A. The best quality of coal in the world is right around there in the middle of that green patch [referring to map].

Q. In the Schuylkill region?—A. Yes; there's hard, bright coal down there.

Q. And why was the development of individual operation so much less marked than in the northern territory? You say the coal is of better quality?—A. The operators came in afterwards, after this lower territory had been acquired.

Q. But it is impossible for any coal lands to be procured in that southern territory at the present time: they are all bought up?—A. The Reading bought out the individual operators down there.

Q. And it carries those lands at the present time as an asset?—A. Yes; I think it has a good one. I would like to have it.

Q. I agree with you perfectly. The question is as to what pays the interest on the debt contracted for it?—A. The interest cost per ton is not very much on that.

Q. (By Mr. CONGER.) How much would it be, a few cents or a dollar?—A. A few cents.

Q. How much would it be approximately?—A. I should say not 5 cents a ton.

Q. (By Mr. KENNEDY.) Then the public pays that charge, on each ton of coal—5 cents?—A. You might say they pay that, and might economize in some other way to offset it. You can't run a scheme cheaper than the Reading is running its business.

Q. (By Mr. RIPLEY.) You say the debt of the Reading is approximately \$150,000,000?—A. I think so.

Q. At 4 per cent the interest would be about \$6,000,000 a year?—A. Yes.

Q. What is the total coal output of the Reading, approximately, at the present time, the total tonnage hauled?—A. Do they carry coal altogether?

Q. No; I ask concerning their shipment of hard coal?—A. They carry about 15,000,000 tons of coal of all kinds.

Q. And you say that \$6,000,000 a year is required to pay the interest charge on carrying the lands?—A. That is what you said; they have a debt of \$150,000,000; that includes a lot of stock that does not pay any dividends.

Q. I was simply trying to get at the relative burden.—A. According to that you have 50 cents a ton on hard coal; but what else do they do? They carry 12,000,000 passengers; they carry 30,000,000 general freight; they carry about 5,000,000 tons of bituminous coal; so you can't throw all that expense on the hard-coal business.

Q. (By Mr. KENNEDY.) You made a statement a while ago that I think was a little bit astonishing to most people, perhaps, that there is no such thing as competition between soft and hard coal?—A. Yes.

Q. Did you read an article in the New York Times a week or ten days ago, by somebody writing under the nom de plume of "J," on that subject?—A. I said in my paper that he was a "jay" in more ways than one.

Q. (Continuing.) I wanted to ask if there was any truth in the statement the writer made that the great magnates are acquiring an interest in the soft-coal roads so as to control the production of anthracite coal?—A. Yes; I know the fellow that wrote that story. It is one of those things the air blows back and forth.

Q. Would you care to say whether you believe the interests of the public and the coal producers will be subserved by a community-of-interest arrangement between the different coal roads, by which they will have an understanding as to what the production shall be?—A. I think the interests of the public will be conserved far better than they ever were before. Put that on record to the fullest degree. We will have more regularity, better and more even conditions than we have had.

Q. (By Mr. CONGER.) Do you think the public would have to pay a lower or a higher price for coal?—A. I have covered that. I said it would be no higher.

Q. No higher than at present, you said?—A. The present is not a high price for coal.

Q. By what standard do you measure when you say that the present is not a high price for coal? Would not the public be better off if it could buy for \$3.25 instead of \$4.25?—A. How many tons of coal do you burn a year? It does not amount to anything—all those things have come up from time to time. The present is not a high price for coal compared with the price of 5, 10, 15, or 20 years ago. The price will probably be reduced after the 1st of April for the summer trade.

Q. You think the present price of coal is not high compared with its cost?—A. I do think so; it is not a high price.

Q. (By Mr. KENNEDY.) I would like to ask if there are anthracite deposits to any considerable extent in other parts of the country than Pennsylvania?—A. No.

Q. Are there anthracite deposits in Colorado?—A. Yes; I think there is some coal in Colorado. I think they dug out some 90,000 tons last year.

Q. Do you think the area is very small?—A. It is very small, indeed.

Q. (By Mr. RIPLEY.) Does any anthracite coal go to the Pacific coast?—A. From here?

Q. By water?—A. Occasionally a cargo. Omaha is about our farthest western point.

Q. (By Mr. C. J. HARRIS.) Have you any further observation or testimony that you would like to give us before you go?—A. No; I think not. I think we have run along on this subject pretty thoroughly. We have not followed these questions, but still, at the same time, we have given the essence of answers that might be made to them, although not in categorical order. The anthracite trade is an enormous trade, and it has gone through a great many hardships since the time that we mined, say, 10,000,000 tons of coal a year. Some people have made a great deal of money; there have been a great many other fortunes lost; people hung on too long. The best man to-day in the trade is the land owner. He sits by and does nothing, and gets his 25 cents a ton royalty. That is very largely paid in that upper district there where you see all those patches [referring to map].

Q. Is labor adequately compensated in the anthracite region?—A. I think so. I talked with men above ground and under ground during that last strike. I made it my business to be there and talk with them, and as long as they get full work at good prices they are satisfied.

Q. (By Mr. KENNEDY.) Have they full work?—A. That is, work such as they are getting to-day.

Q. (By Mr. RIPLEY.) They don't work six days in a week, ten hours a day?—A. They tell me they can't work six days in a week and stay at it many weeks at a time. Coal mining is hard work; they don't want to work three hundred days in a year. They can't do it. Two hundred and fifty days is about right.

Q. Do they work two hundred and fifty days?—A. They have not averaged two hundred and fifty days, but they probably will now.

Q. (By Mr. KENNEDY.) Have not two hundred days been about the average?—A. Two hundred, two hundred and ten; some two hundred and fourteen; some even more than that number; others less. Some of them ran down as low as one hundred and seventy-four, I think, last year, and others ran up to two hundred and forty-four.

Q. Do you look with approval on the work done by the United Mine Workers' in that region within the last year?—A. I think they were very largely right, very largely right. Mitchell did what nobody else could do, that all of these presidents never were able to do—brought about absolute cessation of work in order to restrict the production. All the joint agreements ever made never brought about such a result as he brought about.

Q. How does his work tend to restrict production?—A. Didn't he order the men all out? He got them all out—150,000.

Q. Do you mean to say that the railroad presidents have tried to do that in the past and could not succeed?—A. They tried to agree among themselves that they would not work this week or that, and there was generally some "hocus pocus" above ground or below, and days they were supposed not to be shipping they were getting coal ready, and when it came time to ship they shipped as much in one day as ordinarily in two.

Q. Do you believe in arbitration in disputes between labor and capital?—A. Yes; I have advocated it thoroughly for the last thirty years.

Q. Do you think when the interest is largely public, as in an affair of that kind, that both sides should be compelled, if they will not do it voluntarily, to arbitrate their differences?—A. Where does the public come in in that?

Q. Is not the public a great sufferer when the production of a great article like coal is shut off and the prices go sliding skyward?—A. It is.

Q. Has it not a great interest then?—A. I don't think the public had very much interest in this last strike. I think the people to fight it out are the people most directly concerned. They don't want to bring in a third party.

Q. Is not the third party the entire American people in matters of that kind? Did not the prices go up 25 cents a ton on the people as a result of that strike?—A. The price went up 25 cents a ton as a result of the strike. That means that labor is the cause of the increased cost to the American public.

Q. (By Mr. RIPLEY.) But the companies receive the same return that they did before?—A. Net.

Q. Net or nit?—A. I think so. [Laughter.]

Q. (By Mr. KENNEDY.) I would like to get your opinion as to whether both sides should not be compelled to arbitrate if they will not do so willingly?—A. Why, I don't think you could legislate on that subject.

Q. They have legislated on it in New South Wales, have they not?—A. Compulsory arbitration would not be worth a stick at all. You have got to take the men on both sides. I have seen them, the operator on this side of the table and the men on that side of the table, about the right width so they couldn't hit each other, and they generally stay there for about three good sessions. At the first meeting they may almost come to blows; the second they sober down a bit; and the third time they straighten it out. Mutual concessions are made on both sides of the table, and the thing is done and carried forward and made good for a year or two. They had a session at Indianapolis during the current month; there were 200 people present there representing the soft-coal interests of the country. The dispute is all settled pleasantly for another year.

Q. I don't know but that I gather the idea from what you said that the railroad presidents were much gratified to have Mr. Mitchell bring about that shut down?—A. I think they are gratified at the result.

Q. Did they have any gratification during the strike and previous to the strike over the prospect?—A. No, they did not; it was the contrary, a good deal of bad feeling.

Q. Could not the result of that strike have been advantageous to the men as well?—A. Yes, it has been of great advantage to the men; they are getting more money, and they are getting steady work, and they were relieved of some of those conditions that existed there in regard to the powder charge, and so on.

Q. Are practically all the anthracite miners in the union at the present time?—A. I think Mr. Mitchell claims now he has about 80 per cent of the actual workers in it. There are about 140,000 people altogether. Of course there are a great many boys that naturally would not drift in, can't, on account of age; so if you take 80 per cent you have practically all the mine workers in the anthracite district.

(Testimony closed.)

NEW YORK CITY, February 19, 1901.

TESTIMONY OF MR. JOHN C. HADDOCK,

Independent anthracite-coal operator.

The special subcommission met at 10.50 a. m., Mr. C. J. Harris presiding. At that time Mr. John C. Haddock was sworn as a witness and testified as follows:

Q. (By Mr. C. J. HARRIS.) Mr. Haddock, will you give us your full name and your address, and state the position you occupy?—A. My name is John C. Haddock, my address in New York is No. 1 Broadway, and I am the president of the Plymouth Coal Company.

Q. How long have you been engaged in the anthracite-coal business?—A. I have been identified with the business since 1866, and engaged in the mining of coal since 1878.

Q. We would like for you to go on and give to the commission, in your own way, the position of the independent anthracite-coal operators. I would ask you, first, about what proportion of the anthracite-coal mining is done by the independent operators?—A. It is a very difficult thing to determine just what is an independent operator. I make that answer, not with any desire to evade your question, but in order that we may treat the matter accurately. The independent operator—I mean by that, the operator who mines his coal and sends it into the market, selling the coal himself or having the coal sold for him—represents to-day a very small percentage of the anthracite production. I think the majority of the independent operators or mining companies dispose of their coal under purchase contracts to the various railroads tributary to their operations. So, if you wish to know how much coal is mined by all the independent mining companies—I mean companies without any railroad ownership—that is one thing; and how much coal is being shipped to the market and sold by the independent operators, that is quite another thing.

Q. (By Mr. CONGER.) Suppose you give us, Mr. Haddock, those two different items. —A. If you will defer those questions, as they are questions involving facts and figures, I think it will be possible to get that information for you. Now, it will be simply a guess.

Q. If you could tell us now, approximately, your testimony could be submitted to you; and then if you desired to correct or submit the exact figures you could do that later.—A. Owing to the recent changes, it would be simply a wild guess. If you would let the matter rest that way, I think it would be much more satisfactory to you and more satisfactory to me.

Q. (By Mr. RIPLEY.) For instance, what are some of those recent changes?—A. Well, about two years ago the independent operators projected a new railroad from the Lackawanna regions to tide water.

Q. At what point?—A. I do not remember. I doubt very much whether that was given out—just what point. But they felt that it was impossible to get reasonable rates of transportation, and that there was enough in the prices asked for the carriage of coal to justify the building of a new road, and they secured a charter and made a rather vigorous attempt for the road's construction. They had a certain amount of tonnage pledged to it. If I remember aright, it was known as the New York, Wyoming and Western Railroad.

Q. (By Mr. CONGER.) Was that road ever built?—A. No; the parties who had pledged tonnage to the support of it sold their properties to what is known as the Temple Iron Company. If I am advised correctly, the Temple Iron Company is a syndicate that has been made up of the various railroad companies—the anthracite carriers—and the road was not built; for the reason, of course, that this tonnage had been secured.

Q. (By Mr. RIPLEY.) Was that the road projected along the line of the Delaware and Hudson Canal?—A. No; that was a later effort.

Q. You will speak of that later?—A. It comes in this connection. When this enterprise that I have spoken of, namely, the New York, Wyoming and Western, was abandoned, then some of the remaining operators saw an opportunity of constructing another railroad to tide water, and they secured the bed, as a right of way, of the Delaware and Hudson Canal, and that enterprise received the cooperation of one of our strongest companies, that is, the Pennsylvania Coal Company, and that passed, you know, by a recent trade here into the hands of the Erie, and, of course, it was abandoned.

Q. (By Mr. C. J. HARRIS.) What was the object of these operators inaugurating new roads?—A. The object was to get through rates for transportation, or to get higher prices for their coal. Many of us looked upon the building of new roads

as an economic waste. We felt that it would be wiser and better, in the long run, for the trade to insist upon having reasonable rates for transportation.

Q. Were the rates that the railroads then in existence were charging unreasonable, in your mind?—A. Certainly. The fact that they were was the reason and the justification for the building or projecting of these new roads.

Q. (By Mr. RIPLEY.) Had those attempts anything to do with the present promise of an increase of the percentage, paid to coal operators, to 65?—A. Undoubtedly.

Q. That increase is contemplated, you understand?—A. Undoubtedly.

Q. And will go into force before a great while?—A. That I do not know. The presumption is that this higher price that the companies agree to pay for the coal will be inaugurated sometime in the near future.

Q. (By Mr. KENNEDY.) Could you dispose of your production to the railroads at 60 per cent of the tide-water price?—A. That is the price that has been paid for the coal generally, ever since what is known as the McLeod combination. Mr. McLeod, in order to satisfy the individual operator, who at that time were protesting very vigorously against the rates being charged for transportation, made arrangements, or rather the Reading Company at that time made arrangements to buy coal of the individual operators, paying therefor 60 per cent of the tide-water price—that is, on prepared sizes.

Q. Could you dispose of your production to them at that figure?—A. I presume that I could.

Q. Do you find it more profitable to bring your coal here in their cars and dispose of it yourself?—A. I would have received better results had I disposed of the coal to the company.

Q. (By Mr. C. J. HARRIS.) When I asked you what proportion of the coal is mined by the independent operators I wanted to know, in a general way, something of what the force of the independent operators is—whether it is 10 or 20 per cent at the present time, or 3 per cent; whether it is of considerable magnitude or very small. I did not want the exact percentage. I wish you would state to the commission now about the amount of coal.—A. (Interrupting.) It has been claimed that the independent operators or mining companies represent about 30 per cent. But those figures, you understand, are subject to correction.

Q. Another thing I want to bring out is this, Are the independent operators growing fewer and fewer each year?—A. Oh, yes.

Q. And the present tendency is for the coal to be mined by the coal companies affiliated with the railroad companies?—A. Yes.

Q. And that becomes more and more the case every year?—A. That has been the record of the past.

Q. (By Mr. CONGER.) Mr. Haddock, what was the percentage of the anthracite product that was mined by independent companies, say two years and a half ago, before this road of which you speak was projected? Was it larger than 30 per cent?—A. I could not answer that question offhand.

Q. (By Mr. RIPLEY.) Were those sales which have been going on of independent operators to the railroads entirely voluntary, so far as your knowledge extends? That is to say, do the operators sell out willingly to the railroads, or is the selling a matter of compulsion?—A. Well, I gather that from the prices some of them received it was a voluntary disposition on their part.

Q. It was more profitable to sell out to the companies than to operate?—A. Oh, certainly. That is, I am simply now venturing that opinion on the information that we get.

Q. And that would still remain, perhaps, if an increase of the percentage to 65 were put in force. Would not that be an inducement to the individual operator to continue independent?—A. You can readily see that at some of the prices paid, if the properties represented a very large amount of money, the big prices were very influential with many of the operators, making them secure against the hazards of mining and against the hazards of business.

Q. In what part of the coal fields is the larger proportion of the independent operators at the present time?—A. There are rather more of the independent operators in the northern field than in the Schuylkill regions.

Q. Has the larger proportion of absorption of these independent operators taken place in the northern field during the last few years?—A. I should say yes.

Q. Are there very many independent operators still remaining in the Schuylkill field outside of railroad control?—A. I think not.

Q. And what is the situation in the middle field—in the Lehigh region? That map [referring to map of the various coal fields], if it is correct, would tend to indicate that there is a fairly large proportion of independent operators in that field?—A. I should say there have been many changes in the Lehigh field.

Q. Is that partly because, perhaps, the Delaware, Susquehanna and Schuylkill

road, which is largely a mining company, operates through that territory? In other words, can you explain the difference in the movement, the tendency toward absorption, in the different parts of the coal fields?—A. Well, so far as Schuylkill County is concerned, the work of absorption began in the early seventies by the Philadelphia and Reading Railroad, and that company was driven to it, strange as it may seem, by the action of its competitors.

Q. (By Mr. CONGER.) What action on the part of competitors do you refer to?—A. I mean at that time Mr. Gowan, who was president of the company, did not believe that a railroad company should be engaged in the mining of coal; but his competitors were coming down into his territory and were acquiring coal properties.

Q. (By Mr. RIPLEY.) Do you refer to the New Jersey Central?—A. No; I am speaking now of the Philadelphia and Reading.

Q. I mean the competitors who were coming in.—A. Yes; at that time the New Jersey Central, the D., L. and W., and also the Lehigh Valley and the Pennsylvania; they were coming down into that field. So, to save that tonnage against all possible competition Mr. Gowan and his friends bought 100,000 acres of coal lands, and that was transferred to the Philadelphia and Reading Coal and Iron Company, which was the ancillary company of the Philadelphia and Reading. That, then, was the basis of the absorption of the colliery operations down in the Schuylkill region at that time. And another factor that contributed very much to this consolidation of interests was the distressing labor situation at that time, growing out of the Molly McGuires.

Q. (By Mr. CONGER.) In just what way did the labor situation have its influence on this consolidation of coal lines?—A. The Molly McGuires were so thoroughly organized at that time, and they carried out their threats so effectively and so wickedly that it was a very unpleasant thing for a man to become identified or to continue to be identified with coal mining in Schuylkill County.

Q. And for that reason he was willing to sell out?—A. He was quite willing to sell out. It was this unfortunate influence, very unfortunate, that came into the situation at that time.

Q. (By Mr. RIPLEY.) Were practically all the purchases of coal lands, then, made at this time, along in the seventies?—A. No, that represented the great purchase, really in the early seventies, by the Philadelphia and Reading Railroad.

Q. And have no other great purchases taken place by that company since then? Or was the territory practically all bought up?—A. That question I could not answer definitely. There have been acquisitions of coal properties by the companies, either by the purchase of the coal or by securing control of the product of the collieries. Sometimes the railroad companies would make advances in the way of money for the development of the properties, with the understanding, of course, that they would control the tonnage therefrom.

Q. (By Mr. KENNEDY.) I want to know something more about these two classes of independents, the independents who mine and sell to the railroads and the independents who mine and ship their own coal. I want to know something about the conditions now; why some continue in the business of selling to the railroads and others bring their own coal to the market. I do not know whether you made it quite clear that it was more profitable for them to bring it to the market and sell it or not.—A. I think I made it clear that because of peculiar conditions which enter into our business it would have been more profitable had we disposed of our coal to the company. But I very early took the position that when the railroad company was buying coal at 60 per cent of tide-water prices it was thereby getting a rate of 40 per cent of tide-water prices less selling expenses, and it took a long time to convince our railroad friends that that was a correct theory.

Q. (By Mr. RIPLEY.) What do you mean by "10 per cent less selling expenses?" Will you explain a little more fully?—A. What I mean by that is this: When a railroad company is buying at 60 per cent, then of course there is only 40 per cent left, and there should be an allowance made for selling expenses, or for waste and handling, if an individual operator, who is selling his coal at the mines, should be placed on a parity with the operator who prefers to send his coal to tide.

Q. (By Mr. KENNEDY.) Your operators believe it is more profitable to sell to the railroad companies than to ship it or sell it themselves?—A. Yes, under those conditions.

Q. I would like to know if all the independent producers can freely get cars along the different lines to ship coal to tide water if they so desire, and if it is more profitable to ship in that way. Do you get cars freely on the line you use?—A. I do now, and have for some years.

Q. (By Mr. RIPLEY.) You have had difficulty?—A. Yes.

Q. (By Mr. KENNEDY.) You might tell about the difficulty you have had in the past, and state the condition at the present time. I want to ascertain whether

the independent producers can get cars freely, and also whether it is more profitable for them to sell to the railroad companies or not, and whether if they could get cars freely they would do so and bring the coal to tide water themselves?—A. Of course, it is much more profitable for them to sell to the railroad company and obtain 60 per cent for the production rather than send it to market if they are obliged to pay a 50 per cent rate of transportation. I use those figures illustratively.

Q. Will you explain the difficulties you have had in the past, and how it comes about that you have no difficulties at the present time?—A. Some years ago we were very much disturbed in this matter of getting an adequate supply of cars. It was of great concern to us, not only from the standpoint of our own investment, but also from the standpoint of our men. If I remember right, it was the winter of 1884 and 1885 we were allowed to mine 27 days in 3 months. That was about 9 days a month, and the situation became unbearable. I tried very hard, indeed, to get a better supply of cars, and finally after worrying over the matter for about a year or year and a half, I had to serve notice on the railroad company that if it failed to supply us with an adequate supply of cars, it would be necessary to hold them for all loss and damage. Now you can readily understand that an independent operator dislikes very much to take that position with the railway company; but we had to take it; we were driven to it, and the result was that after that time we had little or no trouble in getting our cars.

Q. (By Mr. CONGER.) You said you were "allowed" to mine about 27 days in 3 months. Do you mean by that that the inadequate supply of cars forced you to restrict your production to these 27 days, or were you a party to some agreement?—A. I was a party to no agreement.

Q. Who "allowed" you, then, to operate your mines only 27 days?—A. The short working time simply grew out of inability to get a car supply.

Q. It was lack of cars that brought about this restriction of production?—A. Yes; that was true at that time; but that, you will notice, was some time in the past, and we have had no reason to complain since then.

Q. How long ago was that?—A. That was in the winter of 1884-85.

Q. No serious difficulty since then?—A. We have had no serious difficulty since then.

Q. (By Mr. KENNEDY.) Do you know of others having such difficulty?—A. I have heard some complaints, but just how true they are I can not say. You understand that the operator who is mining and shipping his own coal has an advantage over the operator who is selling his coal to the company. He occupies a position of absolute independence, and can insist upon an adequate supply of cars. Where he is bound down to the railroad company to furnish coal, and it is stipulated that the railroad company shall determine the amount, that is a different proposition.

Q. Is it true that your class of independents is such a small factor that they are not worth considering by the railroads, and they come to the conclusion it makes no difference whether you have cars or not? Is that the situation with respect to your class of independents getting cars freely at the present time?—A. Well, if we have got to that point that we are so insignificant that we are going to be well treated, it seems to me it is a very desirable position.

Q. (By Mr. C. J. HARRIS.) Suppose a man—an independent operator—makes a contract with the railroad for 60 per cent of the tide-water price, is he limited in his output in that contract?—A. Oh, yes.

Q. They give him a certain proportion—what they think is about right—do they?—A. Presumably, yes.

Q. Do they cut down independent operators by any indirect means in the amount they shall ship at the present time?—A. I could not testify as to that.

Q. Are you independent operators allowed, in your schedule, a certain pro rata of the total shipments, or of the anthracite output?—A. Now, are you speaking of the operators who are selling the coal to the companies?

Q. I am speaking now of the independent operators who mine and sell in the open market in competition or in conjunction with the railroads.—A. Just what might be the treatment of other independent operators by other railroads I can not tell. I can only give you the experience that I have had with the company over whose road I am shipping.

Q. Now, as an independent operator, what do you say in regard to the curtailment of the output; is it a good thing, or is it not?—A. Before I answer that question I would like to make an explanation here in regard to the anthracite situation. The use of anthracite coal in prepared sizes is now almost exclusively confined to what we call the domestic market. Take the sizes known, for instance, as broken egg, stove, and chestnut: their sales are dependent largely on household use. Now, I doubt very much if during the summer months over 15 or 20 per cent of these

prepared sizes are used. So you can readily see that it is very necessary that, if you can not find a market or storage facilities for the coal mined during the summer time, that there should be a restriction somewhere. As to whether the restriction is a wise one; as to whether the restriction is always a just one; whether it is bearing with due proportion—equitable proportion—upon the operators or companies, is quite another question. It is a peculiar condition that is now surrounding the anthracite industry that is to be considered when we approach any discussion of the question. Some of us, in all these matters of restriction and market requirements, prefer to have a voice in them.

Q. (By Mr. KENNEDY.) Do you have a voice in them?—A. Well, thus far we have had, but it has been at quite a cost.

Q. (By Mr. RIPLEY.) What has been the cost? Do you refer to mere friction?—A. I think you have opened up a question there you'd better not press me too hard upon.

Q. (By Mr. KENNEDY.) If it would be injurious to you in your business to speak about it, of course we would not want you to do so.—A. I would not want to incriminate anybody else, either.

Q. (By Mr. RIPLEY.) We should be very glad for a general statement, without specification of names in any case.—A. From what I have said already, you can readily understand that in cases where the operator has insisted upon exercising his right to mine and to ship coal to market, where he has demanded a reasonable rate and equitable rates for transportation, that his way has been beset with some difficulties.

Q. (By Mr. KENNEDY.) I would like to ask, if the fact that you might be able to incriminate somebody else has any influence in making matters easy for you in the shipments of your production?—A. I would not wish to have that word "incriminate" unduly emphasized.

Q. You used it yourself.—A. I know I did; on this matter, take the case of Coxo Bros. & Co., a case in point. They had complained of unreasonable rates charged by the Lehigh Valley Railroad Company; they made a complaint against that company before the Interstate Commerce Commission. If I remember rightly, that was in 1889. There was a case that was tried with remarkable ability on both sides, Mr. Gowan representing at that time Coxo Bros. & Co., and Mr. John G. Johnson, the Lehigh Valley. The trial lasted one or two weeks; and if I remember rightly, after waiting about a year or a year and a half the commission gave an opinion in favor of Coxo Bros. & Co. The decree was opposed by the Lehigh Valley. In the meantime Coxo Brothers were not getting the relief they expected, and they built about 40 miles of railway, connecting their properties.

Q. (By Mr. RIPLEY.) What is the name of that railroad?—A. The Delaware and Schuylkill; as soon as they had become the owners of a railway, or shortly afterwards, they received benefits from that fact that they could not have received otherwise, and did not receive as colliery operators. Now I speak of that circumstance to show what was necessary to be done by a firm of the influence and importance of Coxo Bros. & Co., in order to obtain a reasonable rate for transportation.

Q. (By Mr. KENNEDY.) You said you liked to have a voice in these matters; do you have a voice in fixing the price of coal to the consumer?—A. You must understand, so far as I am concerned, that we do not ask for any voice in the management of anybody else's business; I simply insist and have insisted that I shall have a voice in the management of my own business. My point has been that we are capable of mining our own coal, and that we are capable of marketing our own coal, and I simply wish to have reasonable rates of transportation, and will relieve the railroad company of the burden of finding a market for it.

Q. Do you have any voice in fixing the price of coal to the consumer?—A. Oh, yes.

Q. To what extent?—A. I mean to say, as far as we are concerned, we make a price on our own coal.

Q. You make a price on your own coal?—A. Certainly.

Q. Does it differ materially from the price fixed by the railroad companies?—A. Of course, the tonnage now controlled by the railroad companies is a very important factor, and the price they make will influence our prices—some times may be higher, some times may be lower; but it is a factor in the market.

Q. Do you follow their prices?—A. Sometimes I think we might lead them. What I mean by that is that we might be more responsive, more quickly responsive to certain changes in the market.

Q. (By Mr. RIPLEY.) You speak of leading the market. Do you mean by that perhaps setting a lower price when conditions would seem to warrant it?—A. O, yes. So far as we are concerned on the limited tonnage that we mine there might be some reason why we might wish to move a few thousand tons of coal, and we might possibly make a concession.

Q. Would not such a course have the effect of increasing very largely, permanently, the capacity of your mine? The point I wish to bring out is this: What makes the price of coal? Is it the man that fixes the lowest price? That is, do all ultimately come down to the level of the man who sets the low price or are the large producers able to set a price that is fairly high, arbitrarily, if you please, and do the others come up to that level?—A. There are so many things that would enter into that question that it would be almost impossible to answer it just as you put it. For instance, dependent, as we are largely, upon tide-water market for our coal, we might feel that under certain conditions it might be wise for us to make a concession on the price of, say, 5,000 tons of coal. The railroad company, with its Western connections and other facilities, would not feel it necessary to meet that price. They would say it might be better for this accumulation of 5,000 tons or 10,000 tons to be out of the way than for them to undertake to meet the price on our large production.

Q. Suppose, however, that one of the railroads should thus attempt to set a price a little below the figure, affecting a considerable amount of tonnage, what would happen?—A. What has happened in the past when that has been done? There have been agreements among gentlemen, you know, to prevent anything of that kind.

Q. There have been?—A. Oh, yes.

Q. But they are of the past?—A. They are of the past; yes.

Q. How about the present?—A. Now it is "community of interest," you know.

Q. Will you explain what you mean by the phrase "community of interest?"—A. I only repeat as we read it in the public press. It covers the condition represented in the different railroads in which stockholders having an interest in one company and similar interests in other companies have harmonized by an interchange of stock.

Q. Does that definition apply, to your knowledge, to most of the railroads entering the anthracite territory?—A. I would not say that it applies to all of them, from the knowledge that I have. I would say that probably to 60 or 70 per cent of them.

Q. And will you specify any roads which, to your knowledge or in your belief, are not subject to such an agreement? Witnesses before the commission have testified that they were not entirely subject to such agreement. I will not press the question.—A. I would willingly answer if I had any positive knowledge on that point, but it would seem to me that the ownership, this interownership, need not extend to all the railroads, the anthracite carriers, in order that dominating influences should have control.

Q. It must cover a fair proportion, however, must it not?—A. Yes, certainly; it does—it does.

Q. Have you any information as to the proportion, approximately, which is controlled by "the community of interest?"—A. I think about 60 per cent.

Q. On what grounds do you base this opinion?—A. It is so given out in the public press.

Q. That is the source of your information?—A. And it is not denied, I believe, by the parties—the bankers who have made the necessary arrangements.

Q. (By Mr. C. J. HARRIS.) I suppose the printed reports of these companies would show these facts?—A. Those are facts very easily ascertained now.

Q. (By Mr. CONGER.) You testified that you had been engaged in the coal-mining business about twenty-two years, if I remember correctly?—A. Yes.

Q. Have you all of that time marketed your own coal, or have you at the same time during that period sold to the railroads?—A. We have sold occasionally some of our coal to the railroad companies.

Q. Have you ever sold your production under contract?—A. No; we have not.

Q. Have you ever had negotiation with a road to take your coal under the 60 per cent basis?—A. Yes. What I mean by that is that the railroad company were quite willing to take our coal on that basis.

Q. First, I will ask if at the present time you are marketing your own coal at tidewater, or wherever you market?—A. Yes.

Q. In other words, you are selling it yourself? Now, are you in any way restricted in the production at the mine?—A. No.

Q. You produce as much as you see fit?—A. We fought that battle out.

Q. When you at one time had a contract under consideration, was it proposed in that contract to restrict your production?—A. It never got as far as that; I mean when the suggestion was made in regard to the contract.

Q. Well, do you know whether, if you had made that contract to sell your production to the railroad, if that would have been the condition of it; or, in other words, is it a condition?—A. That is what I would have expected, and one of the reasons why I would not enter into such a contract.

Q. It is your understanding that all of these contracts between the railroads and the mine operators contain a provision that practically restricts the production and agrees upon the amount?—A. I assume that to be true.

Q. Do you know how that production is fixed? Is it judged by the production of past years, or in some such way?—A. It has been determined somewhat by the ascertained capacity of the collieries, and that has been determined somewhat by the production of previous years. Of course when you come to a new operation where you are developing, then it is a matter that has got to be considered, and it is in order to find what the capacity of the new colliery might be.

Q. But these different operators produce about the same percentage of the total output of the year, each one produces about the same percentage of the total production each year, do they not? There is not very much change? In other words, if the Philadelphia and Reading produced last year 21 per cent, it probably was practically 21 per cent in 1899? Is that a fact?—A. I do not know how it has been for the last few years. Of course these are figures that can be easily verified. I presume you have a memorandum showing what the production is of these various operators, have you not?

Mr. RIPLEY. We should be very glad to have it left.

The WITNESS. These simply represent the figures of the production, but there have been some changes. Take the Philadelphia and Reading, which is now standing for about 20.70 per cent. There was a time when the Reading a good many years ago, mined almost one-third of the entire anthracite production; but, growing out of the aggressiveness of the competitors and her embarrassed condition, and changes coming over the whole anthracite situation, she is now down to 20.70 per cent.

Q. Has there not been an intimation in the trade that the Reading would be glad to have a larger proportion than they have at the present time?—A. It would be very human, you know, to want to occupy that position.

Q. Has not a contention to that effect been noticeable at times?—A. At one time the trade was upset very much indeed; I think almost a year; at least six months, by a contention as to whether that line should receive an extra 1 per cent or not.

Q. (By Mr. C. J. HARRIS.) Are not all companies trying to get a higher proportion, not only the Reading, but others?—A. Well, that of course has been one of the causes of friction between the companies in bygone years—the matter of adjusting the percentage as to how much they should receive, and that was one of the most serious problems that came before them. Then of course after that, after they had decided upon their percentage, then adjustments had to be made with individual operators. Some of the roads had more of the individual operators than others. Take, for instance, the Lehigh Valley as a case in point—the large percentage of the shipments of that road came from the individual operators.

Q. (By Mr. RIPLEY.) Is that true at the present time of the Lehigh, that a large proportion still comes from the independent operators?—A. I think it is.

Q. (By Mr. CONGER.) Have the roads in the past undertaken to distribute the percentage of the total output among the collieries each on its own line?—A. That is a matter that sometimes has been determined arbitrarily by the proper officer in charge.

Q. Officer of the railroad?—A. Officer of the railroad company.

Q. Are they undertaking to do it by withholding cars, and was that method in use formerly?—A. Yes.

Q. Is that process quite effective?—A. Yes.

Q. In regard to the price of coal, how is that fixed at the present time? By agreement or by market conditions?—A. I think there is very little agreement at the present time as to the prices. I think that the market is taking care of itself, and the cause of that is the strike or was the strike.

Q. Explain how the strike is regulating the market at the present time.—A. That strike, you know, was a restriction, but it was not an effectual restriction.

Q. (By Mr. RIPLEY.) Of the output?—A. Of the production. The railroad companies prior to that time had undertaken to restrict, in order to maintain prices and high rates of transportation, and the miners thought that what would be good policy for the railroad companies might be a good policy for them, and they did restrict. There was a restriction there that lasted for about six weeks, and the result was that the coal on hand passed into the hands of the consumer, and ever since then the business has been a very active one and the prices have been maintained.

Q. (By Mr. CONGER.) The results of that strike then were beneficial to the railroads?—A. It is a radical view, and I will not be supported by others, but as I look over it I think it was.

Q. Was it beneficial to the operators?—A. I think that they have been receiving some benefit.

Q. Did the miners receive any benefit—the workmen?—A. Yes; they received a benefit; they received a higher rate of wages. It was unfortunate that there should have been a strike.

Q. (By Mr. C. J. HARRIS.) Did the retailers reap a very large benefit, more than their proportion of that strike, or don't you know?—A. I do not see how they could have received any more than their proportion.

Q. I understand that where they raised the price \$1, the retailers raised it \$3 or \$4?—A. There was another side to that phase of it. There were a good many retailers here in New York City who were obligated to furnish coal at lower prices, and they had to stand by that obligation. They had to stand by their contracts.

Q. (By Mr. RIPLEY.) And made the other man pay the difference?—A. Some of it; but in many cases I think they did not receive any advance at all.

Q. Were not those obligations made subject to strikes?—A. Some of them were and others were not.

Q. (By Mr. KENNEDY.) You said the miners received the benefit, the railroads received the benefit, and the operators received the benefit, and then you said the strike was an unfortunate occurrence. Why was it unfortunate?—A. I think it was unfortunate to have to resort to a strike to get proper results.

Q. (By Mr. C. J. HARRIS.) You mean all these people received a benefit, of course. What was the result to the consumers of coal? Was it a benefit to them?—A. They have been obliged to pay a higher price.

Q. (By Mr. KENNEDY.) Is it probable that this strike having proved a benefit to these three parties outside of the public, strikes will be likely to be recognized as liable to produce benefits in the same way year by year in different pursuits in the future?—A. Of course I can't tell what the future is going to be in regard to the anthracite situation. When I speak of the immediate benefits that came from the strike and benefits being reaped by various classes at the present time there is also another side to it.

Q. Let us have that.—A. Strikes may work injury: That is, when the price of anthracite coal becomes too high then it meets competition, for, after all, anthracite is just simply fuel, and it must meet all other kinds of fuel in the market, and when the price gets too high then its use becomes restricted.

Q. (By Mr. RIPLEY.) Have you any means of judging when it gets too high?—A. The fact is shown in the demand. Those forces work slowly, but they are working very effectively. We have felt the influence of them. Take development of the gas range. Here in New York City the demand for coal in the summer time formerly was for anthracite. Now the use of gas is such that it interferes very much indeed with the marketing of certain kinds of anthracite coal.

Q. (By Mr. KENNEDY.) We were informed yesterday that there is no such thing as competition between bituminous and anthracite coal. What do you say about that?—A. Was that opinion given by an expert?

Q. I should think the gentleman was an expert who gave it.—A. Let me say just here on that point that probably 30 per cent of our production at the present time is represented in what we call the small sizes. They might be called by-products; in fact, I speak now of pea coal or buckwheat, No. 1 or No. 2 buckwheat. Now those sizes are strictly competitive with bituminous coal. All those sizes represent from 25 to 30 per cent of the entire anthracite output.

Q. (By Mr. RIPLEY.) Are some of these being obtained from old culm heaps at the present time?—A. Yes.

Q. And were not those culm piles deducted as waste from the wages of laborers 20 years ago?—A. Oh, certainly; there was not then a thought of any market for what was going into the culm pile.

Q. In other words, the companies are selling at a profit to-day the product which they deducted from the wages of the employees 20 years ago by reason of the change of market conditions?—A. By reason of the change of market conditions.

Q. But they are making a substantial profit?—A. But there is no question there was a waste to the operator, too. The waste did not entirely fall upon the miner, because that coal went on the culm bank. That was a waste he had to stand, and the waste at that time was very great.

Q. Were the operatives not paid by the amount that they turned out?—A. They were paid according to various methods and rules. I think they have been paid by the car.

Q. Was not this waste deducted from the carload before they were paid? Was not that the system of deducting the waste, before a carload was made up?—A. Now you are asking me questions antedating my birth, and you know it is very hard for a man to answer such questions.

Q. (By Mr. C. J. HARRIS.) I suppose these culm piles require a certain amount of work now to prepare them for market?—A. Yes.

Q. Which would be a considerable expense per ton?—A. More or less expense is involved in it. My own experience in regard to the culm pile is this: We believe and for a long time past have felt it was a good deal better to take a large part of the pile and send it down into the mines, using that waste product, which was waste product at that time, in sustaining pillars where we can do that to advantage.

Q. Would you be able to estimate what the probable anthracite supply of the Pennsylvania district is; that is, how many years it would last at the present rate of consumption?—A. That has all been done.

Q. We have had various estimates.—A. I think the most reliable estimate that has been made was by an engineer, Mr. Griffiths, who five or six years ago made a statement regarding the remaining tonnage in the anthracite fields.

Q. I am trying to get at an estimate of the probable supply of anthracite coal in the Pennsylvania district, whether it will last for sixty years or one hundred years, or for what time; have you any idea?—A. That would be a very difficult question for me to answer. I could not answer, because we can't tell very well just what the rate of production is going to be.

Q. (By Mr. CONGER.) Summer prices are lower than winter prices, are they not? Is not there usually a rise for the winter trade?—A. Prices are usually lower in the summer time.

Q. Then in the fall, about October, they are increased?—A. As soon as the fall and winter demand sets in.

Q. That increase usually takes place on a fixed day, does it not? Does it not take place simultaneously?—A. In bygone years there was an attempt made to have a simultaneous advance, but the rule was very seldom if ever effective.

Q. Did that rise take place simultaneously last fall?—A. Last fall we had an abnormal condition.

Q. How was it a year ago last fall, do you remember?—A. A year ago last fall, as I remember. I think there was very little change in the market. I am simply speaking now from memory, but I could give figures from our books.

Q. Is it not a fact that when a rise in the price of coal takes place the increase in the price is usually made by all the dealers at the same time?—A. I think that has been the record in the past. I think there has been an understanding among the companies. I am not taken into their confidence, but I think there has been an understanding in regard to prices.

Q. You have not been a party to any such arrangement?—A. No.

Q. What would be your attitude or action in case of a rise in the market? Would you follow with your price?—A. Yes; for the reason that we have to follow sometimes the result of these very combinations, resulting from agreements. The friction engendered becomes sometimes a very potent influence in the market, affecting the price of coal. It is very necessary for us then to meet that condition.

Q. It is your opinion, then, as I gather it, that the price of coal is changed at times by agreement among producers, to which you are not a party?—A. What is the agreement for if it is not for that?

Q. Well, I am trying to get at the facts of the agreement.—A. I think that is a fair inference; at least, we are governed by that in the management of our business.

Q. You are governed by your inference that there is such an agreement among others?—A. Certainly.

Q. And you practically have to make your price to meet the market price?—A. We are not obliged to do so, but we look upon that simply as the chief factor in the whole situation.

Q. Well, I did not mean you are obliged to change because of any agreement, but because of market conditions; in order to do business, you have to meet market prices.

Q. (By Mr. C. J. HARRIS.) What is the limit to which the price of coal could be put provided the production was all in the hands of parties who were working in cooperation with one another?—A. That is a very difficult question to answer. I can readily see how it might be possible to put a price on anthracite that might be extravagantly high, but the moment that is done then we encourage the greater use of bituminous coal, and while it would take some time to bring down the exorbitant price, nevertheless the reduction would be bound to follow. You take to-day the development of the bituminous interests; you take to-day a further installation of such plants as those which have been established in Boston, by-product plants, known as the Whitney, the New England Gas Company; taking the coal from Nova Scotia, making coke from the prepared sizes; furnishing light, heat, and power; let there be an installation of many of those plants along the sea coast or elsewhere, and just as soon as you get anthracite coal much higher, or even at the present prices, you are inviting that competition.

Q. (By Mr. CONGER.) In your opinion, are the present prices of coal pretty high?—A. Yes.

Q. (By Mr. C. J. HARRIS.) About the top?—A. I think so. I think it would be very unwise indeed to have them any higher, and if I have a proper estimate of the ability of the men who are to-day in charge of this whole anthracite combination, or whatever it may be, they certainly would not jeopardize the future of the trade by insisting upon extravagant prices, because that very condition that I have pointed out, that possible competition, is inevitable.

Q. Is it your opinion that the interests of the producers of anthracite coal would be promoted by a lowering of the present prices of coal to the consumer?—A. I apprehend from what I gather that it is the intention to reduce prices later on. If that is the fact, then it seems to me that the judgment that I have passed upon the situation is a correct one.

Q. Do you refer to this as a permanent and general reduction or to a reduction for the summer season only?—A. A reduction for the summer season; and the reason of reduction in the summer season is that dealers, especially dealers in New England who have storage facilities, might be justified in taking on their coal at that time rather than wait until the fall and winter months come, when there is a very active market.

Q. I rather gather from what you say that if a general reduction should be made, so that prices for next winter would not be quite so high as they have been this winter, that such action would not be a detriment to the interests of the anthracite producers.—A. No; certainly not; certainly not. The price of anthracite, as of any commodity, has very little bearing upon the consumption. And then, again, it seems to me that a very important factor will come from what the general condition of the country may be. If everybody is prosperous, if everybody is making money, the matter of paying a little more for anthracite, or a little less, does not enter very much into the calculation.

Q. Bituminous coal is hauled to tide water at a less price per ton than anthracite, is it not?—A. Oh, yes.

Q. Do you know any reason why the railroads could not haul the anthracite coal just as cheaply as the other if they had a mind to do so?—A. It would be necessary for the railroad men to furnish the reason.

Q. Suppose they should adopt that policy and reduce rates on anthracite coal one-half, and the benefit of that reduction in the freight rates should go to the consumer, would such action, in your opinion, increase the consumption, and would it in that way not be in the interest of the producers of anthracite coal?—A. That is hypothetical entirely. The situation changes so very much that were there to be a reduction in rates of transportation it would inure only in very few instances to the benefit of the independent mining company. If you were to ask the question, probably in another form, that if a reduction in the price of coal of 50 cents a ton or \$1 a ton would increase the consumption, I might answer it by saying that it would. Asking the other question whether it would be wise to make that reduction under present conditions, it seems to me that you raise a debatable issue.

Q. Debatable from the standpoint of the producer or of the consumer?—A. Well, either from the standpoint of the producer or the consumer. Now, it is not wise, I presume, for the consumer to insist upon these enterprises being run at a loss or that a railroad company should be run at a loss, or that mining companies should be run at a loss, but growing out of very peculiar conditions that have developed in the anthracite region, growing out of the facts that these companies in bygone years received certain rights and certain privileges, you may say it is all wrong; but there is a condition that can not be changed, and if you were to insist now upon what you might think would be the proper and correct thing and theory, it might work great damage and great loss.

Q. The idea of all combinations ought to be ultimately a lower price to the consumer; is this, in your opinion, the tendency of combinations in the anthracite coal trade?—A. That has not been the record in the past, but, growing out of the fact that there had been combinations, the breaking of them, breaking of agreements, resulted in great advantage to the consumer. The benefit was in the breaking in prices as a result of what has been developed.

Q. (By Mr. KENNEDY.) You spoke about the Whitney plant in Boston having the effect of keeping down the prices of anthracite coal, and also of keeping them from going any higher?—A. I spoke of that as a possible competitor.

Q. As a possible competitor? I suppose you thought also of the possibility and probability of the community of interest people reaching out and getting control of such plants, and also of the Nova Scotia supply, if necessary, to aid them in their work?—A. Yes; I have thought of all that, and then, going still further, I have thought probably there might be some bill passed compelling people to buy

coal at extravagant prices, and all this in order that these enterprises should be supported. That would be the logical outcome.

Q. (By Mr. RIPLEY.) Have you any knowledge as to the way in which soft-coal prices are made? Are they on purely competitive basis, or is there a substantial agreement between, we will say, the so called soft-coal roads?—A. Well, the soft-coal roads have had their troubles lasting, I think, for about three years.

Q. Those troubles are over, in a measure?—A. And last year there came in an application of the community of interest idea, which seems to be so necessary now for salvation—redemption here; for salvation hereafter—and there was an agreement, as I understand it, in regard to prices on that coal.

Q. Can you specify any of the roads concerned? Do you refer to the Norfolk and Western?—A. I am not familiar enough with that situation to testify in regard to it, but all those agreements rely upon the very prosperous condition of the country. Let the demand cease or let there be an interruption of business, and those agreements will disappear as all agreements have done in the past.

Q. (By Mr. KENNEDY.) Mr. Harris asked you if the ultimate object of the combination should be the reduction of the price to consumers. You replied that they had received benefits from those combinations in the past because their agreements were broken and they went to pieces, and so forth. Now, is it your opinion, if the combinations are perfected so that they will not break, but will continue in existence, that the public will not receive benefits as a result of the combination?—A. That depends on how the power is used, because, as I understand it, the essence of this whole question of business cooperation is that it is a matter of power, and depends entirely on how that power is used. It seems to me if power is used wisely by the men who are in charge of the anthracite situation, and there ought to be an attempt on their part to so handle it, that there might be an increase of tonnage rather than a decrease. It will not encounter the hostility and the enmity of the public. That was one of the prime factors in the disaster that overtook the McLeod combination.

Q. Do you believe that if the community of interest plan goes on to the extent of controlling the railroads, the anthracite and soft coal fields, and the iron and steel manufactures that these gentlemen who control them will be wise and not so burden the people that panics and financial crises will result?—A. I can not give any assurance or guaranty as to their behavior. I am only pointing out what would be the wise thing to do.

Q. (By Mr. C. J. HARRIS.) What is going to become of the independent operators, the small operators, in these gigantic operations?—A. What has become of them?

Q. (By Mr. KENNEDY.) Suppose they would come to you and offer you a fair price for your property and there was an understanding that you'd better accept it or you would lose money?—A. We have passed through that temptation.

Q. (By Mr. CONGER.) And still exist?—A. Yes; we still exist, and I presume it is a wonder among our friends that we do.

Q. (By Mr. C. J. HARRIS.) Do I understand you to say that the independent coal operators are rather on the decrease in numbers than otherwise?—A. Yes; the tendency is that way. I think that the feeling on the part of the owners and managers of these great combinations is that so long as the independent operator exists, the freight rate is open to attack.

Q. (By Mr. RIPLEY.) You have said that there is an indication that the percentage rate will be raised to 65; is there not an understanding that in that event the contract will be for a number of years?—A. So far as these contracts are concerned that are now offered, they are to cover the entire amount of coal to be produced from a property.

Q. And to run how many years?—A. For the life of the property.

Q. That means then that the independent operator in signing a contract at 65 per cent, practically, ceases to exist, does it not?—A. Yes; he simply is an operator, he mines his coal and sells it to the railroad company.

Q. But he no longer has any power to fix the price of coal or regulate it in any way?—A. That has been his condition for some years past, you know.

Q. But this will assure it if these contracts are signed?—A. Certainly.

Q. And a number of operators have already assented to such agreements?—A. That I do not know; there is some question; the railroad companies, as I understand it, wish to have a large majority of the operators sign before this arrangement shall be effective.

Q. For the life of the property?—A. For the life of the property. Now let me say just here that while as I said the railroad companies are quite willing to pay 65 per cent, they have not yet manifested a willingness to make a freight rate of 35 per cent.

Q. That is, they wish to have an additional commission for the sale, etc.?—A.
